## PREFACE

THE NEW INTERNATIONAL YEAR BOOK, now in its twenty-fourth issue, aims to present an accurate and concise record of the events of the year. This summary will assist the reader better to understand the political and social conditions of the day, and at least to appreciate the more important developments in the leading fields of human activity. The alphabetical arrangement with appropriate cross references characteristic of the general plan of work, has been found to afford maximum ease of accessibility to the information here assembled with the greatest convenience for the reader. In the 1925 YEAR BOOK, in response to many requests, there has been included the pronunciation in the case of difficult or unusual geographical or other proper names. This follows the system which has proved so useful in the NEW INTERNATIONAL ENCYCLOPÆDIA and is accompanied by a suitable key to pronunciation.

The record of the year 1925 is one full of interest, particularly in the further readjustment of political conditions in Europe. In FRANCE, GERMANY, GREAT BRITAIN, ITALY, and RUSSIA, to mention but a few countries, where the articles are deserving of special attention, there have been important political events. The LOCARNO TREATIES, the deliberations connected with the LEAGUE OF NATIONS, and the discussions of the WORLD COURT also were important features of the year. In the UNITED STATES the Inauguration of President Calvin Coolidge brought into clearer relief his policies and the politics of the day. PROHIBITION as a topic of general discussion bulked even larger than in the preceding year, lending greater interest to methods of enforcement. Social movements and legislation continued to be prominent in Europe and America during the year, and as usual the YEAR BOOK has sought to cover adequately this field with comprehensive discussions of such subjects as CHILD LABOR, CRIME, IMMIGRATION, OLD AGE PENSIONS, MARRIAGE AND DIVORCE, SOCIAL WORK, WELFARE OF CHILDREN, and WOMEN IN INDUSTRY. The customary articles on LITERATURE, ENGLISH AND AMERICAN, FRENCH LITERATURE, GERMAN LITERATURE, SCANDINAVIAN LITERATURE, SPANISH LITERATURE, and PHILOLOGY, MODERN, have been assembled, and present, properly classified, the more important books of the year, with a brief characterization where possible of those specially outstanding.

The year was notable in the field of exploration and under POLAR RESEARCH are mentioned some worthy efforts involving the use of airplanes in geographical discovery. AËRONAUTICS continued to arouse interest, especially through long and important flights and such a catastrophe as the loss of the large dirigible *Shenandoah*. The gradually improving condition of American railways is recorded under RAILWAYS, as well as other developments under ELECTRIC RAILWAYS and RAPID TRANSIT. In business such articles as FINANCIAL REVIEW and INSURANCE indicate the range of topics discussed; while the article on METALLURGY treats new developments in that field. The SCOPES TRIAL in Tennessee, which produced such widespread interest, marking as it did the tragic death of WILLIAM JENNINGS BRYAN, led to further discussions of the theory of evolution. Accordingly, in addition to the references made under ZOÖLOGY, it has seemed advantageous to present under EVOLUTION a brief summary of scientific thought in this field. Un-

## PREFACE

der ASTRONOMY are discussed the Solar Eclipse of January 24, 1925, and Relativity, while under various heads are given summaries of advances in Medicine and Surgery as also in other fields of pure and applied science. The YEAR BOOK record, while necessarily in outline, is comprehensive and complete, and the history of the year 1925 will be found not less interesting than that of its immediate predecessors.

LIST OF CONTRIBUTORS

**AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, RECLAMATION, ETC.**

EDWIN WEST ALLEN, PH.D.,

UNITED STATES DEPARTMENT OF AGRICULTURE,  
AND

ALFRED CHARLES TRUE, PH.D.,

UNITED STATES DEPARTMENT OF AGRICULTURE;

WALTER H. EVANS, PH.D. (BOTANY AND PLANT DISEASES); JOHN I. SCHULTE (CROP PRODUCTION); GEORGE HAINES (LIVE STOCK; DAIRYING); WALTER H. BEAL (FERTILIZERS AND SOILS); SYBIL L. SMITH (FOOD AND NUTRITION); HOWARD L. KNIGHT (AGRICULTURAL LEGISLATION); J. W. WELLINGTON (HORTICULTURE AND FORESTRY); RAY P. TEELE (RECLAMATION); AND WILLIAM A. HOOKER (ECONOMIC ENTOMOLOGY; VETERINARY MEDICINE).

**ANTHROPOLOGY (WITH 'ETHNOLOGY)**

LESLIE SPIER, PH.D.,

UNIVERSITY OF WASHINGTON.

**ARCHÆOLOGY**

KATE DENNY MacKNIGHT ELDERKIN,  
PH.D.,

ASSOCIATE EDITOR, *American Journal of Archaeology*.

**ARCHITECTURE**

TALBOT F. HAMLIN,

MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS.

**ASTRONOMY; METEOROLOGY; EARTH-QUAKES**

EDGAR W. WOOLARD,

UNITED STATES WEATHER BUREAU.

**BIOGRAPHY**

THE OFFICE STAFF.

**CHEMISTRY; EXPOSITIONS; CELEBRATIONS**

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,  
EDITOR FOR THE UNITED STATES NATIONAL MUSEUM.

**CIVIL ENGINEERING; AERONAUTICS**

HERBERT TREADWELL WADE.

**DRAMA AND THEATRE**

AYERELL BROUGHTON, A.M.

INSTRUCTOR IN ENGLISH, COLUMBIA UNIVERSITY.

**ECONOMIC, SOCIAL AND POLITICAL SCIENCE SUBJECTS**

L. M. HACKER.

**EDUCATION; UNIVERSITIES**

MILO B. HILLEGAS, PH.D.,

PROFESSOR OF EDUCATION, COLUMBIA UNIVERSITY.

**ELECTRICAL ENGINEERING SUBJECTS**

REGINALD GORDON,

FORMERLY ASSOCIATE EDITOR OF *Industrial Management*.

**EUROPEAN HISTORY AND GAZETTEER**

IRWIN SCOFIELD GUERNSEY, M.A.,

PROFESSOR OF AMERICAN HISTORY, DEWITT CLINTON HIGH SCHOOL, NEW YORK CITY.

**EXPLORATION; POLAR RESEARCH; ALASKA**

A. W. GREELY, PH.D.,

MAJOR GENERAL, UNITED STATES ARMY; COMMANDER GREELY POLAR EXPEDITION.

**FINANCIAL REVIEW**

H. PARKER WILLIS,

EDITOR, *The Journal of Commerce*, NEW YORK;  
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

**FRENCH LITERATURE**

ALBERT SCHINZ, PH.D.,

PROFESSOR OF FRENCH LITERATURE, SMITH COLLEGE.

**GEOLOGY**

DAVID HALE NEWLAND,

FORMERLY ASSISTANT STATE GEOLOGIST OF NEW YORK.

**GERMAN LITERATURE**

AMELIA VON ENDE.

**INSURANCE**

WILLIAM S. CRAWFORD,

INSURANCE EDITOR, *The Journal of Commerce*, NEW YORK.

**INTERNATIONAL LAW; ARBITRATION; LOCARNO TREATIES; LEAGUE OF NATIONS; WORLD COURT; PEACE MOVEMENTS; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,

SECRETARY OF THE MUNICIPAL NATIONAL LEAGUE AND MEMBER OF THE MOHONK CONFERENCE; FORMERLY PRESIDENT OF THE BOARD OF PERSONAL REGISTRATION, PHILADELPHIA.

**LABOR LEGISLATION**

JOHN B. ANDREWS, PH.D.,

SECRETARY OF THE AMERICAN ASSOCIATION FOR LABOR LEGISLATION AND EDITOR OF *American Labor Legislation Review*.

**LITERATURE, ENGLISH AND AMERICAN**

WILLIAM BENFIELD PRESSEY, A.M.,

ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH COLLEGE.

**MANUFACTURING SUBJECTS; BIOGRAPHY**

PHILIP COAN.

**MEDICAL SUBJECTS**  
EDWARD PREBLE, M.D.

**METALLURGY**  
EDWARD HODGES ROBIE,  
ASSOCIATE EDITOR OF *Engineering and Mining Journal-Press*.

**MILITARY PROGRESS**  
JOHN J. BRADLEY,  
COLONEL, INFANTRY, U. S. A.

**MINERALOGY**  
HERBERT P. WHITLOCK, C.E.,  
CURATOR DEPARTMENT OF MINERALOGY, AMERICAN MUSEUM OF NATURAL HISTORY, NEW YORK CITY.

**MUSIC**  
ALFRED REMY, M.A.,  
EXTENSION LECTURER, COLUMBIA UNIVERSITY, AND FORMERLY PROFESSOR OF HARMONY AND COUNTERPOINT, INTERNATIONAL CONSERVATORY, NEW YORK; EDITOR OF *Baker's Biographical Dictionary of Musicians*.

**NAVAL PROGRESS AND RELATED SUBJECTS**  
LEWIS SAYRE VAN DUZER,  
CAPTAIN, U. S. N., RETIRED; WRITER ON NAVAL AND NAUTICAL SUBJECTS.

**PAINTING AND SCULPTURE**  
GEORGE KRIEHN, PH.D.,  
EXTENSION LECTURER IN THE HISTORY OF ART, COLUMBIA UNIVERSITY; LECTURER, WOMAN'S ART SCHOOL, COOPER UNION, NEW YORK CITY, AND  
MRS. EVELYN VAN NORMAN, NEW YORK CITY.

**PHILOLOGY (CLASSICAL)**  
CHARLES KNAPP, PH.D.,  
PROFESSOR OF GREEK AND LATIN, BARNARD COLLEGE, COLUMBIA UNIVERSITY.

**PHILOLOGY (MODERN)**  
JOHN LAWRENCE GERIG, A.M., PH.D.,  
PROFESSOR OF CELTIC AND EXECUTIVE OFFICER, DEPARTMENT OF ROMANCE LANGUAGES, COLUMBIA UNIVERSITY; EDITOR-IN-CHIEF OF *Romanic Review*, etc.

**PHYSICS**  
HENRY D. HUBBARD,  
SECRETARY, UNITED STATES BUREAU OF STANDARDS.

**PHILOSOPHY; PSYCHOLOGY; PSYCHICAL RESEARCH**  
BENJAMIN GINZBURG, M.A.,  
DEPARTMENT OF PHILOSOPHY, COLLEGE OF THE CITY OF NEW YORK.

**RAILWAYS**  
WILLIAM E. HOOPER,  
FORMER FINANCIAL EDITOR, *Railway Age*.

**RELIGIOUS BODIES AND SOCIETIES**  
THE OFFICE STAFF.

**ROMAN CATHOLIC CHURCH**  
THOMAS F. MEEHAN,  
EDITORIAL STAFF, *America*.

**SANITARY ENGINEERING AND MUNICIPAL SUBJECTS**  
MOSES NELSON BAKER, PH.D., C.E.,  
ASSOCIATE EDITOR OF THE *Engineering News-Record*.

**SCANDINAVIAN LITERATURE**  
HARRY V. E. PALMBLAD, M.A.,  
PROFESSOR OF GERMAN AND FRENCH, PHILLIPS UNIVERSITY.

**SPANISH LITERATURE**  
JOHN D. FITZ-GERALD, PH.D., Litt.D.,  
PROFESSOR OF SPANISH, UNIVERSITY OF ILLINOIS; MEMBER OF THE HISPANIC SOCIETY OF AMERICA; CORRESPONDING MEMBER OF THE SPANISH ROYAL ACADEMY, AND OF THE ROYAL ACADEMY OF HISTORY OF MADRID.

**SPORTS**  
CHARLES A. TAYLOR,  
SPORTING DEPARTMENT, *New York American*.

**UNITED STATES AND STATE ARTICLES**  
ALLEN LEON CHURCHILL.

**ZOOLOGY AND EVOLUTION**  
AARON L. TREADWELL, PH.D.,  
DEPARTMENT OF ZOOLOGY, VASSAR COLLEGE.

## KEY TO PRONUNCIATION

æ	as in ale, fate. Also see ɛ, below.	ɒ	as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this.
ā	senate, chaotic.	g	go, get.
ā	glare, care, and as <i>e</i> in there. See ɛ, below.	g	the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
ā	am, at.	h	<i>j</i> in the Spanish Jijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger.
ā	arm, father.	hw	<i>wh</i> in which.
ā	ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (ʌ).	κ	<i>ch</i> in the German ich, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <i>κ</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word Khan.
“	final, regal, where it is of a neutral or obscure quality.	ŋ	in sinker, longer.
“	all, fall.	ng	sing, long.
“	eve.	n	the French bon, Bourbon, and <i>m</i> in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce “onion” without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>ñ</i> , as in the case o. São Antão.
“	elate, evade.	sh	shine, shut.
“	end, pet. The characters ɛ, ā, and ā are used for <i>a</i> , <i>ae</i> in German, as in Baedeker, Gräfe, Handel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <i>a</i> is also sometimes indicated by ɛ, sometimes by <i>ā</i> or <i>ā</i> .	th	thrust, thin.
“	fern, her, and as <i>i</i> in sir. Also for <i>δ</i> , <i>oe</i> , in German, as in Gothe, Goethe, Ortel, Oertel, and for <i>eu</i> and <i>œu</i> in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.	tn	then, this.
“	agency, judgment, where it is of a neutral or obscure quality.	zh	<i>z</i> in azure, and <i>s</i> in pleasure.
i	ice, quiet.	An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tã'b'l (table), kãz'm (chasm).	
i	quiescent.	Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.	
i	ill, fit.	When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling, as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the NEW INTERNATIONAL ENCYCLOPEDIA.	
i	old, sober.		
ō	obey, sobriety.		
ō	orb, nor.		
ō	odd, forest, not.		
o	atom, carol, where it has a neutral or obscure quality.		
oi	oil, boil, and for <i>eu</i> in German, as in Feuerbach.		
ou	food, fool, and as <i>u</i> in rude, rule.		
ou	house, mouse.		
ū	use, mule.		
ū	unite.		
ū	cut, but.		
u	full, put, or as <i>oo</i> in foot, book. Also for <i>ū</i> in German, as in München, Muller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
ū	urn, burn.		
y	yet, yield.		
ɐ	the Spanish Habana, Córdoba, where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
ch	chair, cheese.		

# THE NEW INTERNATIONAL YEAR BOOK

**ABRAHAMS, ISRAEL.** British author, Jewish scholar, and reader in Talmudic and Rabbinic literature at Cambridge University, died October 6. He was born in London, Nov. 26, 1858, and was educated at Jews' College and University College, London, taking the degree of M.A. at London College in philosophy, being the first student of Jews' College to proceed to that degree. Dr. Abrahams was lecturer in English and mathematics at Jews' College from 1881-99, and lecturer in homiletics, 1894-1903. In 1902 he succeeded Dr. S. Schechter as reader in Rabbinics at Cambridge University, and in 1906 was appointed curator in Oriental literature in the University Library. He wrote in conjunction with Claude Montefiore, *Aspects of Judaism* (1895), designed to help explain Judaism to the Christian and create a new environment of fairness and scholarship. He also wrote *Jewish Life in the Middle Ages* (1896), and many other volumes or essays among which were: *Chapters on Jewish Literature* (1899); *Hebrew Lessons* (jointly with Alice Lucas) (1903); *Maimonides* (jointly with D. Yellin) (1903); *Festival Studies* (1905); *Bibliography of Hebrew and Judaism*; *Short History of Jewish Literature* (1906); *Judaism, in Religions, Ancient and Modern* (1907); *The Literary Remains of S. Singer* (1908); an edition of Macaulay on *Jewish Disabilities* (1909); *The Book of Delight* (1913); *Annotated Hebrew Prayer Book* (1914); *Studies in Pharisaism* (vol. i, 1917, vol. ii, 1924); *By-paths in Hebraic Bookland* (1920); *Poetry and Religion* (1921); and *Permanent Values* (1923). His scholarship won him the degree of M.A., *honoris causa*, from Cambridge University in 1902. He was first president of the Union of Jewish Literary Societies; president of the Jewish Historical Society of England, 1905; honorary president of the University of Glasgow Theological Society, 1907; first Lewishohn Lecturer, New York, 1912; president of the Society of Historical Theology, Oxford, 1921; Litt.D. (Western Pennsylvania), and D.D. (Hebrew Union College). He edited the *Jewish Quarterly Review*. His last book published during his life was *The Glory of God*, while at the time of his death a volume of *Jewish Ethical Wills* was about ready for publication.

**ABYSSINIA.** A kingdom in East Africa between the Red Sea and the Anglo-Egyptian Sudan comprising the provinces: Harar; Equatorial Provinces; Gondar; Jimma; Wollo; Shoa; Sellale; Edjow; Wollaga; Guimira; Gojan, etc. The area is variously estimated at from 350,000

to over 430,000 square miles. The former figure is probably the more accurate. The most recent estimate of the population places it at about 10,000,000. The capital is Addis Abeba, with 60,000 to 70,000 inhabitants, of whom about 1000 were foreigners. The other chief city, Harar, had a population of about 40,000. Slavery is a recognized domestic institution, but the slave trade is forbidden by an ancient law which was renewed by a decree issued in 1923.

The chief pursuits are agriculture and stock raising, but the methods are primitive and economic development has been retarded by the lack of adequate transportation. The system of land tenure is feudal and the soil theoretically belongs to the Negus or Emperor. The products include cotton, sugar cane, the date palm, coffee, and grapes, but with the exception of coffee, they are nowhere extensively raised. The production of the so-called Harari coffee is increasing from year to year. There is a wild coffee plant which is found especially in southern and western Abyssinia bearing a berry known as Abyssinia coffee of which the supply is said to be unlimited. Among the other native products are hides and skins, millet, barley, wheat, and tobacco, and there are valuable forest trees, including rubber. In some districts iron is found and is used in the manufacture of native weapons. In the western districts the mining of gold has been carried on, and coal, copper, and sulphur are also found.

The chief exports are hides and skins, coffee, wax, ivory, civet, and native butter; and the chief imports, cotton shirting, cotton goods, liquors, railway material, provisions, sugar, and petroleum. The principal line of trade is along the French-Ethiopian railway, but there is a considerable caravan trade in the interior. The imports come mainly from the United States, Great Britain, France, India, Italy, and Japan. No trustworthy figures for complete trade were available, but a British authority estimates the total commerce at about £2,500,000 annually. Trade with Great Britain in 1924 was: Imports from Abyssinia, £28,094; exports to Abyssinia, £11,550.

The French-Ethiopian railway connects Jibouti in French Somaliland with Addis Abeba, having reached the latter point in 1917. There are about 2000 miles of telegraph line and a few miles of telephone connection. For details in respect to religion, education, and government see preceding YEAR BOOKS. The Empress in

1925 was still Waizeru Zauditu, daughter of the late Emperor Menelik. She was named Empress after the deposition of Lij Yasu in 1916; but the actual authority continued to vest in Ras Tafari, great nephew of Menelik, who had been proclaimed heir to the throne (see preceding YEAR BOOKS). In August, 1919, a modified form of cabinet government was introduced, but its powers are very shadowy. On Sept. 28, 1923, Abyssinia was admitted to the League of Nations.

**ACADEMY, FRENCH** (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France, and officially considered the highest: founded in 1635, reorganized in 1816. The list of the Immortals at the beginning of 1925 was as follows: Paul Bourget; Camille Hanoataux; Henri Lavedan; René Bazin; Maurice Donnay; Jean Richepin; Raymond Poincaré; Eugène Brieux; R. Doumic; Marcel Prévost; Henri de Régnier; Maréchal Lyautey; H. R. D. Cochin; Pierre de la Gorce; Henri Bergson; Maréchal Joffre; Louis Barthou; Monsignor Baudrillart; René Boylesve-Tardieu; François de Curel; Jules Cambon; Georges Clemenceau; Maréchal Foch; H. Bordeaux; Robert de Flers; Joseph Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Georges de Porto-Riche; Edouard Estaunié; Maître Henri Robert; Charles Jonnart; Abbé Bremond; Georges Lecomte; Emil Picard; and Albert Besnard.

At the meeting of the French Academy held in Paris on Nov. 19, 1925, three new members were elected: Paul Valéry, philosopher, poet and critic, was elected to the chair made vacant by the death of Anatole France; Auguste Armand Ghislain Marie Joseph Nompar de Caumont, twelfth Duke de la Force, French author, was chosen to succeed the Duke d'Haussonville; and Louis Bertrand was elected to the chair of Maurice Barrès. Paul Valéry, one of the foremost French writers in his day was born at Cette, in 1871, attracted widespread attention by his "Introduction to the Method of Leonardo da Vinci." He also wrote critical and philosophical works, and several volumes of verse. The Duke de la Force was a descendant of one of the oldest families in France, and was the author of many historical works, the most notable of which was his biography of his ancestor, the Duke of Lauzon. M. Bertrand, a classical scholar and critic was born at Spinourt in the Meuse Department, Mar. 20, 1886. From 1891 to 1900 he was Professor of Rhetoric in the Lycée of Algiers, and during his sojourn in this country he wrote several novels: *Pépète the Beloved*, 1904, *Cina*, 1901, and *Blood of the Nations*, 1899; and accumulated material for several important works including a historical work on *St. Augustine* published in 1913. Later he wrote *Blood of the Martyrs*, 1917, *The Infanta*, 1920, *Gardenio*, *The Man with the Flame-Colored Ribbons* and his *Louis XIV*, 1923. Among his critical works were several volumes dealing with Flaubert and other writers of that period.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A society founded in 1904 by members of the National Institute of Arts and Letters, which was incorporated and given a charter by Act of Congress approved Apr. 17, 1916. The purposes of the organization are the furtherance of the interests of literature and the fine arts. The membership is limited to 50

chairs, similar to the French Academy, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music. There were four vacancies caused by deaths in 1925, as follows: George Washington Cable, died January 3; Willard LeRoy Metcalf, died March 9; John Singer Sargent, died April 15; and Paul Wayland Bartlett, died September 20. There was one election to membership on November 19, that being George Pierce Baker. In addition to the one named, the membership in 1925 constituted the following in order of election: Daniel Chester French; James Ford Rhodes; William Milligan Sloane; Robert Underwood Johnson; Henry van Dyke; William Crary Brownell; Arthur Twining Hadley; Edwin Howland Blashfield; Thomas Hastings; Brander Mathews; George Edward Woodberry; George Whitefield Chadwick; George de Forest Brush; William Rutherford Mead; Bliss Perry; Abbott Lawrence Lowell; Nicholas Murray Butler; Owen Wister; Herbert Adams; Augustus Thomas; Timothy Cole; Cass Gilbert; Robert Grant; Frederick MacMonnies; William Gillette; Paul Elmer More; Gari Melchers; Elihu Root; Brand Whitlock; Hamlin Garland; Paul Shorey; Charles Adams Platt; Archer Milton Huntington; Childe Hassam; David Jayne Hill; Lorado Taft; Booth Tarkington; Charles Dana Gibson; Joseph Pennell; Stuart Sherman; John Charles Van Dyke; Royal Cortissoz; Albert J. Beveridge; Henry Hadley; and Charles Downer Hazen.

The Academy at a public meeting held on Feb. 27, 1925, presented to Walter Hampden its gold medal for good diction on the stage which had been awarded to him at the annual meeting in November. At this time also on the Evangeline Wilbur Blashfield Foundation, Robert Underwood Johnson read a paper, "The Glory of Words."

Directors of the Academy in 1925 were: President, William Milligan Sloane; Chancellor, Nicholas Murray Butler; Secretary, Robert Underwood Johnson; Treasurer, Thomas Hastings; Hamlin Garland, Cass Gilbert, Archer Milton Huntington, Brander Mathews, and Augustus Thomas. The Academy has headquarters at 633 West 155th Street, New York, its own building first occupied in 1923.

**ACADEMY OF INTERNATIONAL LAW.** See INTERNATIONAL LAW.

**ACADEMY OF SCIENCES.** See NATIONAL ACADEMY OF SCIENCES.

**ACCIDENTS.** See RAILWAY ACCIDENTS; SAFETY AT SEA.

**ACOUSTICS.** See PHYSICS.

**ACWORTH, SIR WILLIAM MITCHELL,** K.C.S.I. British railway authority and economist, died April 2. Sir William Acworth, who enjoyed an international reputation in railway matters was born on Nov. 22, 1850, in Bath. Attending Christ Church College, Oxford University he received the degree of M.A. in 1875 and straightway devoted himself to various railway problems, publishing his first book, *Railways of England* in 1880. From that time he was a member of many royal and other investigating committees for the British railways and in 1916 was a member of the Royal Commission for inquiry into the Canadian Railways, serving in a similar capacity two years later in an inquiry

of the railways of Southern Rhodesia. After his service on the Canadian Commission he testified on the operation of government-owned railways before the Joint Congressional Committee on Interstate Commerce in Washington. He was chairman of the committee which investigated railway conditions in India in 1921 and acted for the League of Nations in developing plans for the reorganization of the Austrian Federal Railways in 1923, to secure operation under private corporate control. Sir William Acworth served as one of the two experts to draft the plan for the reorganization of the government-owned railways of Germany as a semi-private corporation which figured as an integral part of the Dawes report on German reparations. In 1921 he was created a Knight and in the following year was made Knight Commander of the Star of India. His important books on railways and railway economics include the following: *Railways of Scotland* (1890); *Railways and Traders* (1891); *Railways of England* (1899); *Elements of Railway Economics* (1905), subsequently revised and reissued; and *State Railway Ownership* (1920).

**ADELBERT COLLEGE.** See WESTERN RESERVE UNIVERSITY.

**ADELPHI COLLEGE.** A non-sectarian institution of higher education for women at Brooklyn, N. Y.; incorporated in 1896. The enrollment in the fall of 1925 consisted of 483 students following the regular schedule for the B.A. degree, and 90 others in the extension courses. The summer school registration was 97. The faculty, in the fall of 1925, numbered 33, including two additions, an assistant professor of psychology and economics, and an instructor in biology. The income for the year amounted to \$126,989. During the year a successful campaign for a million dollar additional endowment fund gained pledges for the full amount, of which practically one-half had already been paid. The library contained 17,000 volumes. President, Frank Dickinson Blodgett, A.M., LL.D.

**ADEN, a'den or a'den.** A volcanic peninsula on the Arabian coast belonging to Great Britain and lying about 100 miles east of Bab-el-Mandeb. Area, 75 square miles; including the Protectorate, about 9000 square miles. Within the limits of the settlement are also the peninsula of Little Aden, some villages on the mainland, and the island of Perim, the last named having an area of 5 square miles. The population of Aden and Perim in 1921 was 54,923, of whom 80 per cent were Mohammedans. The population of the Protectorate was about 100,000. The manufactures, which are unimportant, consist chiefly of salt and cigarettes.

There is a considerable commerce. The total imports of 1923-24 were valued at £7,876,832, and the total exports £6,906,032. Among the chief imports are cotton piece goods, grain, coal, coffee, sugar, hides and skins, tobacco, fruit, vegetables, and other provisions; and among the chief exports, coffee, gums, hides and skins, cotton goods, tobacco, grain, sugar, and provisions. The commerce arises from the fact that it is an important point of transshipment. Merchant vessels entered at the port of Aden in 1923-24 numbered 1220 of 4,103,319 net tons. Over half the vessels were British.

Attached to Aden are the Kuria Muria islands off the Arabian coast, five in number, ceded

by the Sultan of Muskat. Aden is under a British political resident with four assistants, the British Colonial Office having charge of all political questions and the British War Office of military questions. Political resident and general officer commanding in 1925, Lieut-Gen. T. E. Scott.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** Founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research and to procure for the labors of scientific men increased facilities and a wider usefulness. Its membership in 1925 totaled over 14,000 and constituted a coöperation of individuals for the advancement of science and those who are interested in the progress of knowledge and education. The association is also a general organization of about 106 wholly autonomous and independent associated scientific societies and 10 local academies of science and learning, 72 of the larger associated societies and all of the associated academies being officially affiliated with the association. The direction of the association rests in a council consisting of the officers, representatives of the affiliated societies and academies and eight members elected at large by the council. It holds an annual meeting at the same time as the association and operates through an executive committee during the interim. The activities of the association are in general of three kinds: those related to the holding of the annual and other meetings; those related to publications; and those related to the advance of knowledge by research. It has 15 sections representing the main current subdivisions of science, as follows: mathematics, physics, chemistry, astronomy, psychology, social and economic sciences, historical and philological sciences, anthropology, geology, zoological sciences, botanical sciences, engineering, medical science, agriculture, and education. The association convenes annually for a week in the latter part of the year and many of the associated organizations gather at the same time.

The official organ of the association is a weekly journal, *Science*, which furnishes an open forum for the discussion of questions regarding science and education. Almost every branch of scientific knowledge is represented in its columns. In addition the association issues an elaborate programme for the annual meeting. The permanent endowment of the association in 1925 amounted to \$138,776.66 the income from which is employed to advance scientific research; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are conducted by the association: the Pacific Division, including the Pacific States, Alaska and the Philippine and Hawaiian Islands, and the Southwestern Division, including Arizona, New Mexico, Colorado, western Texas and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in other projects in their respective fields.

The eighty-second meeting of the association convened in Kansas City, Mo., December 28 to January 2; it was the first meeting to be held in that city. About 2000 attended, this being one of the smaller meetings. (The preceding meeting, in Washington, D. C., 1924-25, was the largest in the history of the association, with

an attendance of about 4700.) Twenty-nine societies met with the association at Kansas City and there were 117 sessions, at which 985 papers and addresses were read. The science exhibition was well developed at this meeting, with exhibits by commercial firms as well as by individual research workers and by research institutions and laboratories. The president was Dr. Michael I. Pupin, of Columbia University. The retiring president was Dr. J. McKeen Cattell, psychologist and editor of scientific and educational journals, of Garrison, N. Y. He gave the annual presidential address, on the phenomenal recent advance of psychological science and its applicability to the affairs of life. Many public lectures were given at Kansas City, including one on the nature of the atom, by Dr. Robert A. Millikan, of the Norman Bridge Physical Laboratory, Pasadena, California. Another important public lecture was by Dr. F. R. Moulton, of the University of Chicago, on the origin and evolution of worlds. A motion-picture lecture on the habits of beavers, by Dr. Elliot R. Downing, of the University of Chicago, attracted a large audience. The annual association prize of \$1000 for 1925-26 was awarded to Dr. Dayton C. Miller, of the Case School of Applied Science, Cleveland, Ohio, for an outstanding contribution to our knowledge of the ether of space. The association had a standing committee on the place of the sciences in education, which was making a survey of this subject. The chairman of this committee is Dr. Otis W. Caldwell, of the Lincoln School, Columbia University. There was also a committee of 100 on scientific research in general, the secretary of which was Dr. Rodney H. True, of the University of Pennsylvania. The permanent secretary of the association was Dr. Burton E. Livingston, of Johns Hopkins University; information regarding the organization may be secured by addressing him at the Smithsonian Institution Building, Washington, D. C. The president of the association for 1926 was Dr. L. H. Bailey, botanist, horticulturist, educator, and editor, of Ithaca, N. Y. The next meeting of the association was to occur at Philadelphia, December 27, 1926, to January 1, 1927.

#### ADVENT CHRISTIANS. See ADVENTISTS.

**ADVENTISTS.** The Advent Movement had its origin with William Miller, who believed not only in the coming of Christ in person, power and glory, but that such an advent was at hand and the date might be fixed with some definiteness. The first general gathering of those interested took place in Boston, October, 1840, the movement at that time being wholly within the existing churches, but in 1845 there was a general organization of the adherents of the Advent's doctrine and a conference was held in Albany, N. Y., in April of that year, in which a declaration of principles was adopted embodying the views of Mr. Miller. For ten years the organization then formed included practically all the Adventists, but gradually separate bodies developed, beginning with the Adventist Christian Church, organized in 1855 and including the Seventh-day Adventist, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

**ADVENT CHRISTIAN CHURCH.** This church, which is congregational in church government,

holds simply to the general immanence of Christ's return but takes the position that the day cannot be determined. It holds a biennial general conference, that of 1924 being in June, at Aurora, Ill. Statistics of 1924 covering 45 conferences, showed 537 churches; 528 ordained ministers; 137 licensed ministers; 28,297 church members; 289 Sunday schools; 15,435 Sunday school members; 138 local societies; with 4758 members. Sixteen conferences did not report Sunday school statistics in this year so that the number doubtless was in excess. Four publication societies are maintained and two educational institutions, Aurora College at Aurora, Ill., and the New England School of Theology at 17 Rockville Park, Boston, Mass. Periodicals, such as the *World's Crisis* (Boston) and the *Messiah's Advocate* (Oakland) and *Our Hope* (Mendota, Ill.) are published by the denomination and the philanthropic institutions include The American Advent Christian Home and Orphanage at Dowling Park, Fla., and the Vernon Home for ministers and missionaries, at South Vernon, Mass. During 1925 Rev. Lester F. Reynolds, D.D., General Director of the denominational Forward Movement died on Sept. 9, 1925, and at a meeting of the Executive Committee of the General Conference held in Boston, October 16 to 19, Rev. George A. Osman of Los Angeles, Calif., was elected general director in his place. During the year Rev. C. F. King, secretary of the American Advent Mission Society was succeeded by Rev. H. W. Hewitt.

**SEVENTH-DAY ADVENTISTS.** In 1924 this was the largest denomination of the Adventists group and embraced 12 union conferences in the United States and Canada, general headquarters being maintained at Takoma Park, Washington, D. C. This denomination believes that the seventh day of the week from sunset on Friday to sunset on Saturday is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church was congregational in government, though under the general supervision of the conference. The statistical report of the church for 1924 indicated in the North American Division, 2250 churches, 818 ordained ministers, and 110,502 church members. Sabbath schools numbered 2773 and the membership 116,256. Figures for the foreign divisions were: 3143 churches, 772 ordained ministers, 131,716 church members, 4699 Sabbath schools, and an enrollment therein of 161,015. The movement maintains in the United States and Canada 64 educational institutions, which in 1924 had 11,865 students enrolled in all grades. Of the colleges and seminaries, Loma Linda Medical College, Calif., and Pacific Union College, St. Helena, Calif., are the largest. There are also 69 educational institutions maintained in foreign countries. There are 18 publishing houses of the denomination in North America, and 34 in foreign countries; denominational literature is issued in 114 languages. Evangelistic work is conducted in 119 countries. Periodicals of the movement include: *Advent Review and Sabbath Herald* (Washington); *Signs of the Times* (Mountain View, Calif.); and *Watchman* (Nashville, Tenn.).

Statistics for all Adventist bodies in the United States were in 1924, 2854 churches; 1955 ministers; 140,200 church members; 3175 Sunday schools; and 130,871 members.

**AERONAUTICS.** There were few radical inventions or startling innovations in design or construction of either planes or engines to be noted in 1925, but there was unquestionably an aroused interest in air travel and a great amount of discussion, both by governments and by the general public. There were as usual important long-distance flights, and a number of records for speed and distance were broken, but the outstanding feature of the year was the extension of air travel and the increased use of airplanes in commercial traffic. The U. S. Air Mail established night flying and extended its facilities, and at the same time awarded contracts for routes to be operated independently. In Europe interest in commercial aviation, which was supported in large part by government subsidies, increased materially, and deficiencies in railway transportation, particularly in Eastern Europe were made good for passengers, mails and light freight.

In the United States a number of government and technical committees and commissions investigated various phases of aeronautics, particularly its general control and the relation of military aeronautics to the development of civic flying, and the administration of the air service in the army and navy. Speeches and published remarks made by Col. William Mitchell, Air Service, U. S. A., on the organization and administration of the air services in the War and Navy departments led to his court-martial, which was held at Washington beginning October 28. This trial wandered somewhat afield from the consideration of the charges so as to permit Colonel Mitchell to present testimony in support of his allegations and his general plans for changes in the organization of this arm. Due to various conditions and a wide-spread popular interest, a disproportionate amount of attention was attracted to this trial, and the conviction of Colonel Mitchell which is considered elsewhere at greater length. See **MILITARY PROGRESS**; and under **UNITED STATES**.

President Coolidge appointed a commission which investigated the entire question of the relation of the government to aeronautics, a Naval Court of Inquiry was held in connection with the loss of the U. S. Airship *Shenandoah*, a committee of the House of Representatives held sessions, and others from various engineering boards also were organized and presented reports during the year. Those actively and aggressively interested in aviation demanded a unified air service with a cabinet secretary at its head, responsible only to the President and the divorcing from the existing war and navy departments all control of aircraft. By many this was held to be an extreme position and while there were revealed deficiencies in the organization and administration of the American Army and Navy air services, yet it was the general opinion that these could be improved and made more efficient without radically altering the general scheme of organization, or disturbing the balance which should assist in a properly coordinated scheme of defense.

A Committee of the U. S. Department of Commerce and the American Engineering Council, after holding many hearings submitted a comprehensive report. The fundamental difficulties retarding the development of civil aviation in the United States, according to this committee,

were the lack of legal status and government control of air travel, the absence of an established government programme to increase the civil and industrial uses of aircraft, the lack of commercial aircraft and equipment best adapted to profitable commercial operations, and the consequent lack of public and business confidence and support. It was recommended in the report that Congress should enact a civil aeronautics law establishing in the Department of Commerce a bureau of aeronautics, which would be empowered to regulate air navigation and to license pilots and inspect aircraft, and otherwise supervise and encourage civil aviation. It was also recommended that the Government should refrain from non-military flying activities, which could be properly performed by private operation, and should extend the use of aircraft for the handling of mail, survey of forests, and other purposes, carrying on these operations by contract as far as possible. It was further recommended that lighted airways should be established, emergency landing fields provided, and that private companies should be permitted the use to a limited degree of the government fields. The ratification by the U. S. Government of the International Air Navigation Convention was also recommended by the committee.

**REPORT OF THE PRESIDENT'S AIR BOARD.** In the great mass of discussion regarding military and civil aeronautics in the United States and the large amount of popular interest manifested in the same, the report of an Air Board, appointed by the President of the United States on Sept. 12, 1925, stood out as taking a rational position in the matter and one removed as far as possible from the claims and prejudices of partisans. This board appointed "for the purpose of making a study of the best means of developing and applying aircraft in national defense and to supplement the studies already made by the war and navy departments" presented its report to the President on Dec. 2. This board consisted of Major General James G. Harbord, U. S. A., retired, of New York City; Rear Admiral Frank F. Fletcher, U. S. N., retired, of Washington, D. C.; Dwight W. Morrow, of Englewood, N. J., lawyer and banker; Howard E. Coffin, of Detroit, consulting engineer and expert in aeronautics; Colonel Hiram Bingham, of New Haven, Conn., U. S. Senator, formerly in the U. S. Air Service and member of the Senate Committee on Military Affairs; Hon. Carl Vinson of Milledgeville, Ga., member of the House Committee on Naval Affairs; Hon. James A. Parker, of Salem, N. Y., chairman of the House Committee on Interstate and Foreign Commerce; Hon. Arthur C. Denison, of Grand Rapids, Mich., Judge of the Sixth Circuit Court of Appeals; Prof. William F. Durand, of Stanford University, Calif., president of the American Society of Mechanical Engineers, member of the National Advisory Committee for Aeronautics.

The report stated: "We do not consider that air power as an arm of national defense has yet demonstrated its value—certainly not in a country situated as ours—for independent operations of such a character as to justify the organization of a separate department. We believe that such independent missions as it is capable of can be better carried out under the

high command of the Army or Navy, as the case may be." The report was conservative and opposed a separate air force, but it admitted certain serious shortcomings and proposed practical reforms which, it was believed, would be a further development of the air service.

The board held public hearings for four weeks, during which 99 witnesses were heard, more than half of them actual flyers, and the entire situation was canvassed as thoroughly as possible, the resources in aircraft of European governments also being considered. The board made an important distinction between military and civil aviation, believing that both should not be administered under the same head, and it recommended strongly the promotion of civil air activities, not only on their own account but for their effect on national defense. The report described and praised the work of the United States Air Mail and recommended its expansion, but it did not refer extensively to the other commercial uses to which the airplane had been put in the United States. It recommended a bureau of air navigation under an additional Assistant Secretary of Commerce.

The Board recommended for the industry (1)

The adoption of the policy of continuity in orders and of the standard rate of replacement.

(2) That production orders be given only to companies which maintain design staffs of reasonable size and keep them active. (3) That the property rights in design should be fully recognized. (4) That governmental competition with the civil industry in production activity should be eliminated so far as possible except in those projects impracticable of realization by the civil industry. (5) That a succession of small orders of experimental designs to be given limited service tests should accompany orders for standard designs during a period of production test.

(6) Existing statutes covering the procurement of supplies and requiring competitive bidding to be modified where necessary to allow putting the recommendations previously made into effect.

(7) Government research in aeronautic sciences to be actively continued and the testing facilities of the various department agencies should be made available to the civil industry.

On Dec. 6, 1925, the United States Senate passed a bill to promote as well as regulate air navigation which had been introduced by Senator Hiram Bingham of Connecticut, a former officer in the Air Service, a member of the Senate Committee on Military Affairs, and a member of the President's Air Board, referred to above. This bill was passed by the Senate the day following its introduction by Senator Bingham, and provided for the appointment of an Assistant Secretary of Commerce, charged with the encouragement and regulation of air navigation. It also provided for the inspection and regulation of all air pilots and also of aircraft. The stimulation of commercial aviation was made the province of the Secretary of Commerce and he was assigned a series of specific duties in connection with inspection, establishment of aerial traffic rules and regulations; designating and approving air routes, increasing the establishment of airdromes and air ports, recommending to the Weather Bureau, if necessary, meteorological service; the development of commercial air navigation and the dissemination of information relative thereto; the investigation

of causes of accidents in civil navigation; the exchange of foreign government information pertaining to civil aviation. There were also provided the operation and purchase on appropriations for this purpose of such aircraft as the Secretary of Commerce might deem necessary for carrying out the provisions of the act. This act represented in many respects the recommendations of the President's Air Board.

### BALLOONS

**NATIONAL BALLOON RACE OF 1925.** On May 1st, 1925, there was started at St. Joseph, Missouri, the annual National Elimination Balloon Race, success in which also carried with it the right to represent the United States in the second Gordon Bennett Cup Race at Brussels later in the year. The winner of the race, Wade T. Van Orman in the balloon *Goodyear III*, accomplished a distance of 585 miles, descending at Reform, Pickens County, Alabama. Accordingly, there was awarded to Van Orman, who was the winner of the 1924 race also the Litchfield Trophy. A mixture of 60 per cent water gas and 40 per cent hydrogen was used for inflating the bags of the competing aerostats. This process was seriously interfered with by a strong wind from the northwest so that it was necessary to turn off the gas during the process of filling. At 5:47 in the afternoon the pilot balloon *Kansas City*, in charge of Maurice Smith, who was refused permission to compete in the race on the score that his balloon was less than half as large as the other balloons and was filled entirely with hydrogen gas instead of a mixture of 60 per cent water gas, started. The first of the contesting balloons, the United States Army *S-14*, piloted by Lieut. William J. Flood, took off at 5:59 p.m. and sailed away in a stiff northwest breeze. There were four other contestants as specified in the accompanying table, while the sixth balloon, United States Army *S-16*, commanded by Capt. Raymond E. O'Neil, was damaged when the net about the balloon and the big bag ripped open and deflated. Both H. E. Honeywell and Herbert Von Thaden objected to the filling of their balloon during the official inflation period on account of the bad weather conditions and they were warned by the referee of the competition, Maj. S. B. Lambert, that they would be subject to disqualification. At a meeting of the Contest Committee subsequently Honeywell and Von Thaden were each demoted one position, so that Lieutenant Flood with 342 miles to his credit was placed above Honeywell who had 543 miles distance. According to the final return Van Orman was rated first, Flood second, and Honeywell third, and these were the representatives who went abroad to contest for the second Gordon Bennett cup. Major Maurice Smith in the pilot balloon accomplished 450 miles descending at Crenshaw, Panola County, Mississippi.

**INTERNATIONAL BALLOON RACE.** The Gordon Bennett Cup Race for 1925 was started on June 7th from Solbosch Plain near Brussels, Belgium. Seven countries participated being represented by 18 balloons and a start was made under most favorable weather conditions, though with excessive heat. There was a light breeze from the northeast prevailing and the general course of the balloons was in a westerly direction. The

## NATIONAL ELIMINATION BALLOON RACE, 1925

Pilot	Aide	Balloon	Point of Landing	Distance miles
W. T. Van Orman	C. K. Wollam	Goodyear III	Reform, Pickens Co., Ala.	585
Lt. Wm. J. Flood	Lt. Haynie McCormack	Army S-14	18 miles south Batesville, Independence Co., Ark.	342
H. E. Honeywell (Demoted to 3rd position)	Harry Preston	St. Joseph	1 mile west of Aberdeen, Monroe Co., Miss.	543
Herbert Von Thaden (demoted to 5th position)	W. C. Naylor	Detroit	3 miles N. E. Selma, Anderson Co., Kansas	110
Maj. Maurice Smith (non-contestant pilot balloon)		Kansas City	Crenshaw, Panola Co., Miss.	450

competitors were as follows:—Belgium, Ernest Demuyter, Champion in 1924 and winner of the original Gordon Bennett Trophy, in the balloon *Belgica*; Labrousse in the *Ville Bruxelles*; and Veenstra in the *Prince Leopold*. Great Britain, Lieutenant Colonel Dunville in the *Banshee III*; Capt. C. W. Spencer in the *Miramar*; and Capt. J. F. Johnson in the *Elsie*. Spain, Magdalena in the *Duro*; De La Rocha in the *Espero*; Susana in the *Penaranda*. United States, W. T. Van Orman and Wollam as aide in the balloon *Goodyear III*; Lieutenant Flood and Lieutenant McCormack in the balloon *S-14*; France, Bienaimie in the *Picardie*; Blanchet in the *Maroc*; and Latu in the *Grande Charles*. Italy was represented by Grassis in the *Aerostiere*; Valle in the *Ciampino V*; Trionfale; and Ilari in the *Ciampino III*. Switzerland was represented by Dr. Bachman in the *Helvetia*.

The accompanying tabulation gives the official results of the First International Balloon Race for the Second Gordon Bennett trophy:

of being caught in a gale. The commanding officer, Lieutenant-Commander Zachary Lansdowne U. S. N., and four other officers, and nine members of the crew lost their lives, while two were seriously injured. The airship cast off from the mooring mast at Lakehurst, N. J., at 2.52 p.m. on Sept. 2, 1925, with a crew of 42 officers and men. In response to a number of requests from western cities, it was scheduled for a trip over Pittsburgh, Columbus and Indianapolis, with a stop at Scottsfield for refueling, then continuing over Kansas City, Des Moines, Milwaukee, Minneapolis-St. Paul, returning via Detroit, a number of Michigan cities, Toledo, Sandusky and Cleveland, and thence back to Lakehurst. Everything went well during the night, while crossing Pennsylvania and West Virginia, but reaching Ohio, bad weather conditions prevailed and after being sighted over Cambridge, Ohio, unusual conditions developed. The airship from 5.22 a.m. to 5.47 a.m. Eastern Standard Time, was proceed-

No.	Balloon	Country	Pilot	Aide	Kms.	Miles
1.	Prince Leopold	Belgium	A. Veenstra	P. Quersin	1345	835.7

## AIRSHIPS

DESTRUCTION OF THE U. S. AIRSHIP SHENANDOAH. The U. S. Airship *Shenandoah*, fully described in the YEAR BOOK for 1923 and 1924 was totally destroyed on September 3, at approximately 5 a.m. over Caldwell, Ohio, as the result

ing on its course at a height of 1800 feet, but was making little or no ground speed on account of strong adverse winds. Under the influence of vertical air currents, the ship suddenly rose to a height of 3150 feet, but was brought under control and steadied. It then

rose again more rapidly to 6100 feet and dropped rapidly to 3000 feet, and finally rose again sharply up by the nose to approximately a height of 3700 feet, at which the ship broke, the first break in the main structure occurring in the framing and separating the ship into two parts, the control car remaining attached to the forward section. This control car almost immediately broke loose and dropped to the earth, and soon a second break occurred in the aft section of the ship, which was dropped more slowly and was carried by the wind a distance of about one-third of a mile before reaching the earth. The forward section was operated as a free balloon by the personnel in it, and landed safely about 12 miles from the scene of the disaster. Lieutenant-Commander Rosendahl and Lieutenant Meyer navigated this section and maintained discipline. Of those lost, eight were in the control car, four in power cars 4 and 5, and two in the body of the ship at the time of the disaster.

The *Shenandoah* was a total loss and the disaster aroused widespread interest inasmuch as the ship was supposed to represent the latest development of the United States Navy Bureau of Aeronautics in this field. There was considerable criticism of the Navy Department in using the ship to arouse public interest among the interior cities and there were charges that the ship had been weakened by repairs and readjustments and that it had been sent on its mission against the advice of the commanding officers. Few of these charges were supported at the Court of Inquiry, which was held in the latter months of the year and which investigated the subject very thoroughly from all the different points of view. Difference of engineering opinion developed, but the more general opinion was that the accident was unavoidable and was inherent in the experimental work required in developing a new and hazardous art. See VESSELS, NAVAL.

**BRITISH DIRIGIBLE.** During the year the British Air Service paid more attention to dirigibles and the large R33 was reconditioned, making a number of flights. On April 16 with a nucleus crew on board, it was torn away from its mooring mast at Pulham in a gale and in badly damaged condition was driven over the North Sea, not returning for 30 hours. Nevertheless, by skillful navigation it was able to return to its landing place without particularly serious damage or loss of life.

#### HELICOPTER

During the year comparatively little progress was made in helicopters, although the Brennan helicopter, which had been developed by the British Air Service, received an official test on October 2 at Farnborough in the course of which it was slightly damaged. A few additional significant details were revealed as to this machine, which was developed by the British Air Service. The novelty of the year in this field, however, was the LaCierva "Autogiro," which was publicly tested at Farnborough and aroused the interest of the British Air Service. The experimental machine under test was an ordinary airplane fuselage with the wings removed and a central propeller provided, attached to which were four narrow planes about 17 feet in span, which revolved at a slight angle to the

horizontal plane. When revolving at a rate of about 120 revolutions per minute, the forward speeding machine keeps them turning at that speed, at which they are capable of supporting the weight of the machine. For control there are a rudder and elevators and in case of a failure of the engine the machine merely sinks downward and forward. The Autogiro was not properly a helicopter but it possessed many of the features set forth in that machine. In the test of October 19 it was stated that in full flight the machine developed a forward speed of 68 miles an hour, while from a height of 500 feet it descended practically vertically to the ground, its forward speed at the moment of alighting being not more than 10 miles an hour. The machine at this time met with a slight mishap but it was being studied by the British Air Ministry, though at the end of the year it was not decided whether they would adopt it and it was reported that demonstrations would be made before the French Air Service.

#### RECORDS

**AIRPLANE RECORDS OF THE YEAR.** In 1925 a number of records were supplanted and the increased speed of various types of airplanes was demonstrated. The record of Lieut. Cyrus Bettis, Air Service, U. S. A., who won the Pulitzer Race described on page 11 at Mitchel Field, in a Curtiss R3C-2 plane with Curtis V 1400 h.p. engine, covering 100 kilometers at a speed of 249.337 miles per hour and 200 kilometers at 248.975 miles per hour, was ratified by the International Aeronautic Federation and thus became an official world record. The same plane, when fitted with pontoons and flown as a seaplane by Lieutenant Doolittle, also of the Air Service, covered 100 kilometers at 234.772 miles per hour in winning the Schneider Seaplane Trophy at Baltimore, this being the average of his laps 6 and 7, and the world's 200 kilometer record with the average of laps 4, 5, 6, and 7, or 234.335 miles per hour. He also made a maximum straightaway speed of 245.713 miles per hour over a 3 kilometer course. This record was officially ratified by the International Aeronautic Federation.

In September 12, Fernand Lasne, French aviator, at Villesauvage-La Marmogne lowered the speed record over 1500 kilometers hitherto held by the American Lieut. Harold R. Harris. Lasne flew in a Nieuport-Delage 42C1 plane with a 500 horse power Hispano Suiza engine making 1500 kilometers over the Etampes-Marmogne course in 6 hours, 51 minutes, and 17 seconds, at an average speed of 218.827 kilometers per hour, or 135.461 miles per hour. On September 1 he made 2000 kilometers in 9 hours, 8 minutes and 32 seconds, or an average speed of 218.759 kilometers per hour or 135.930 miles per hour. Lasne in the same plane also made a world's record over 1000 kilometers of 248.296 kilometers per hour (154.283 miles per hour) without useful load. With useful loads of 500 kilograms and 250 kilograms he had records for 500 kilometers of 218.759 kilometers per hour (135.930 miles per hour) and 249.618 kilometers per hour (155.105 miles per hour).

New world duration and distance records of 45 hours, 11 minutes and 59 seconds, and 2732 miles, were made by the French pilots Drouhin and Landry, at Etampes-Chartres, France, Au-

THE WRECK OF THE "SHENANDOAH"

gust 7, 8, and 9, in a Farman single motored bi-plane with 450 h.p. engine, which took off with 14,300 pounds of fuel and oil on board. The course traversed was 62 miles in circuit and the records stated supplant the former duration record of Coupet and Drouhin of 37 hr. 11 min. 59 seconds, July 16-17, 1924, and the distance record of 2516.55 miles made in the United States by Kelly and Macready, Apr. 16-17, 1923. The pilots said they could have gone further with more gasoline, but as it was the distance covered was greater than from Paris to New York.

New world's duration and distance records for seaplanes were also made during the year, both coming to the United States Navy. For duration, Lieutenants C. H. Schildhauer and J. R. Kyle flying from Philadelphia in the U. S. Navy PN-9 with two Packard 500 h.p. engines, May 1-2, were in the air 28 hours, 35 minutes, and 27 seconds. The airline distance record for seaplanes was achieved by Commander John Rodgers, U. S. N. and Lieutenant Byron Connell in their flight to Hawaii, described below. They flew in a PN-9 plane with two Packard engines, type 1-A-1500, of 500 h.p. each, making 3206 kilometers (1730 nautical miles).

New records for seaplanes with useful loads of 1500 kilograms (3306.93 pounds) were made in Italy on Feb. 10, 1925 by Guido Guidi in a Dornier-Wal Idaor plane with two Rols-Royce engines of 200 h. p., at Pisa, Feb. 10, 1925. On this flight they made a record for duration of 3 hours, 33 minutes, 35 seconds; for distance, 507.38 kilometers (315.27 miles); for altitude, 3682 meters (12,080 feet); for speed for 100 kilometers 168.523 kilometers per hour (104.715 miles per hour), speed for 200 kilometers, 168.523 kilometers per hour (104.715 miles per hour), and speed for 500 kilometers 168.523 kilometers per hour (104.715 miles per hour).

#### AIRPLANE COMPETITIONS

**NEW YORK AIR RACES.** The most important air meet of the year in the United States was held at Mitchel Field, Long Island, beginning October 8, and ending on October 13, severe weather conditions postponing the final contest. While the competition was largely under military auspices and most of the entries were from the military services, yet there were a number of civilian machines and pilots and considerable interest was manifested in civilian planes especially those that were being built in quantity production along standardized lines. These included planes with a power plant of about 200 horse power, some of which had closed cabins and were available for passenger transportation as well as for mail, while others with open cabins and not so well adapted for passenger work, could be employed for feeder air mail lines. There were in evidence at the competition engines especially designed for commercial use, and also a three-engine airplane, which indicated a possibility that such machines could be used on American air lines as they had been in Europe in limited numbers.

The Air Mail planes did not participate in the various competitions, which was regretted at the time as this service had under test some new planes which many considered typical of the most interesting developments of the American aircraft industry during the year. There were a few light planes flown, but there was no special

interest manifested or evidence of striking improvements in this field. On the purely military side new test machines were shown in the observation plane race and also in the bombing race. These were samples of recent developments and had not been put in quantity production for the Army.

The preliminary event of the meet, the "On-to-New York Race" was won by Kenneth W. Montee, flying a Montee Special biplane of his own construction and making the journey from Santa Monica, Calif. To qualify for this race pilots were required to fly at least 200 miles, and the prize was awarded on the basis of distance flown, fuel consumption, passengers carried, speed, and other factors entering into safe and efficient flying. The logs of the pilots were certified and all were considered by the contest committee. Montee's plane was equipped with a Curtiss OX5 engine rated at 125.75 horse power. Second place in this competition also went to a California aviator, E. R. Ramlin, who flew from Hollywood in the Montee MRI monoplane, equipped with a Curtiss K6 engine developing 143.12 horse power. For the third place, D. A. Askew, who flew from Texas in a Canadian Curtiss JN plane, tied with Herbert L. Kindred, flying in a Curtiss JN4C plane, who also started from Texas. The fourth place was awarded to H. C. Mummert, in the Mercury Junior feeder-line mail plane.

The contest for the Glenn H. Curtiss Trophy was the first contest in the competition proper at the field, being a free-for-all race over a distance of 100 miles or 8 laps, or 20 times around a 5 mile course. Some 15 planes started in this race, being sent off in three groups, the last group consisting of four planes, but later C. D. Chamberlain, who had arrived late, was permitted to start in his small monoplane fitted with a three-cylinder Wright L4 engine. Chamberlain's plane, however, crashed on the first lap and his passenger, Lawrence Burnelli, was killed and he himself suffered injuries. The race was won by Basil L. Rowe in a Thomas Morse S4E plane with a 105.75 horse power Aëromarine Type B engine. The average speed was 102.9 miles per hour. Second place was won by E. P. Lott in a Thomas Morse SAB plane with a Curtiss OX5 engine rated at 125.7 horse power. C. D. Emrick in a Hartcell FC2 plane with a Curtiss OX5 engine was third. This race was limited to civilian entries and consisted of 8 laps around a 12 mile course.

In the second event, The Merchants Association of New York race, a free-for-all competition for planes of higher power, restricted to 2-, 3-, and 4-place civilian machines with engines limited in horse power to about 200 horse power and planes carrying a total load of 340 lbs. including the pilot, 12 entries started. This also was for 8 laps of 12 miles, making a distance of 100 miles, and was won by C. S. Jones in a Curtiss-Oriole plane with a Curtiss C6 engine. His average speed was 134.2 miles per hour, which was five and one-tenth miles faster than that made by Capt. H. Lemaître in the Breguet plane in the Liberty Engine Builders Trophy Race held later. Second place went to Frederick H. Becker in a Wright-Bellanca plane with a Wright Whirlwind J4 engine, while Basil L. Rowe was third in a SVA plane with an aëromarine USD engine.

The Liberty Engine Builders Trophy race was one of the important events of the competition, being flown over a distance of 180 miles, 15 laps around a course of 12 miles. In this 16 contestants started, including flying representatives of the French army and of the U. S. Army and Navy. The race was won by Capt. Henri Lemaître, flying in a Breguet plane with a Breguet XIX Renault motor of 463 horse power. Captain Lemaître's average speed was 129.1 miles per hour and the heat in which he contested was most interesting as he was able to fly at moderate speed until the ninth round when he passed into the lead and on his tenth lap was well ahead of the other planes. Second place in the race was taken by Lieut. E. B. Bayley, of the U. S. Army in a Douglas XO2 plane with an average speed of 128.3 miles per hour, while third place went to Lieut. G. R. Henderson in an O2B1 plane of Boeing manufacture, with a Liberty engine of 412.25 horse power with an average speed of 127.9 miles per hour. Fourth place went to Capt. G. Pelletier d'Oisy of the French army in a Breguet plane with a Breguet XIX motor of 325 horse power, who made 127.4 miles per hour, average speed. Lieut. E. R. McReynolds in an army DeHaviland 4B plane with a Liberty motor of 412.25 horse power was fifth, with an average speed of 126.0 miles per hour, and Lieut. H. R. Clark in a similar machine was sixth with an average speed of 125.4 miles per hour. In all there were 16 entries of which 10 came from the U. S. Army Air Service, all of which, except one, were equipped with the standard Liberty DH4 planes. The U. S. Navy made three entries, consisting of one DH4B and two O2B1 planes of Boeing manufacture, while the French war department entered two Breguet planes, as previously noted.

The competition for the trophy of the Association Town and Country Club of Detroit furnished an interesting event as it indicated considerable commercial development from the previous year. This was open to two-seaters of the commercial type equipped with engines of 800 cubic inches cylinder capacity, and involved the determination of the load carried, speed, and power. In this competition 14 planes took part, and the contest involved a distance of 100 miles, or 8 laps of the closed course of 12 miles. The total prizes amounted to \$2500,—one-half going to the six planes making the highest speed and the other half to the six planes furnished with the highest figure of merit. First place in the speed section was taken by C. S. Jones in his Curtiss-Oriole with CG engine, with an average speed of 128.4 miles for the 100 miles, or at a lap time of 44 min. 51 sec. Second place was taken by Basil L. Rowe, in a SVA plane of Aéromarine USD engine with an average speed of 119.8 miles per hour, and third place by Frederick H. Becker with a Wright-Bellanca plane with a J4 engine, making an average speed of 112.0 miles per hour. In the efficiency test of this competition the Wright-Bellanca six-passenger cabin monoplane stood first with 597.5 points, while after it came the Curtiss-Oriole which scored 394.8 points. This race involved considerable uncertainty both on account of the weather and of the fact that four competitors were disqualified for being unable to get off in

the required 700 ft., while a fifth competitor, misunderstanding the signal, landed to discover that the judges had referred to one of the other entrants.

At the final meeting held on Monday, the Scientific American Trophy Contest was started over a 50 mile course, 10 times around a 5 mile course. Here eight low-powered planes entered, all but one equipped with motorcycle engines of 18 and 19 horse power, and the winner was Terry U. Dack of Dayton, Ohio., who flew a Powell Racer with a Bristol Cherub engine. His best lap was made at a speed of 76.6 miles per hour while his average was 75.16 miles per hour. Second place went to Clyde Ernack, in a Johnson Bumblebee with a Henderson four cylinder engine rated at 19.85 horse power with 76.13 miles per hour, while the third place was taken by E. Dormoy in a Dormoy plane with Henderson engine, who made an average of 52.2 miles per hour.

The Dayton Daily News Light Airplane Trophy Race, consisting of 10 laps over a 50 mile course, was won by Joseph A. Faucher, in a Powell Racer with a Bristol Cherub motor, with Clyde Ernack second, in a Johnson Bumble Bee with a Henderson motor, and E. Dormoy, third, with a Dormoy plane with a Henderson motor. H. C. Mummert, the only other competitor, flew in a Mummert plane with a Harley-Davidson motor and was slightly behind the winner of third place.

In the Detroit News Air Transport Trophy Race, a competition intended to foster the development of large commercial machines, the contestants in 1925 were restricted to army and navy planes; there were no American entries of strictly commercial types. The competition was interesting in that modern machines were entered, bombers, transport planes, torpedo planes and three purpose planes all participating. The first place was taken by a new Huff Daland XLB bomber, with a Packard motor of 800 horse power and a large propeller. The course was 10 laps over a total distance of 120 miles and Lieut. E. E. Harmon, the pilot, averaged 119.91 miles for the distance. This plane averaged about 130 miles per hour on the straight-away distance, which approximated the speed of 135 miles per hour previously made over the speed course. Second place was won by Lieut. C. S. Schilt in a Douglas DT4 with a Wright T3A engine of 4867 horse power, and third place was taken by Lieut. K. B. Wolfe of the army air service in the Epicyclic C1 plane with an engine of 450 horse power with 113.58 miles per hour.

The John L. Mitchell Trophy Race, which was limited to pursuit pilots of the U. S. Army Air Service was participated in by 10 Curtiss PW8 planes, all equipped with Curtiss D12 motors. Nine of the 10 planes finished successfully and without engine trouble and the highest average speed made was 161.5 miles per hour by the winner, Lieut. T. K. Matthews. The course was 120 miles with 10 laps of 12 miles each and this accounted for the fact that the speed of the winner did not compare favorably with 175.41 miles per hour made in 1924 by Lieut. Cyrus Bettis at Dayton. The winner of the Mitchell Trophy Race is given the opportunity of representing the U. S. Service in the Pulitzer Trophy Race of the following year. The second

place in this competition was taken by Lieut. G. F. Schulgen and third by Lieut. A. J. Lyon.

**PULITZER TROPHY RACE.** The most important event of the entire meet, the Pulitzer Trophy Race, took place on Monday, October 12th, under more favorable weather conditions. It was flown over a course of 200 kilometers in 4 laps, and six planes from the U. S. Army and Navy participated, two being Curtiss Racers and four Curtiss Pursuit planes. The Curtiss racers, one being flown by the army and the other by the navy, were equipped with high compression Curtiss Type V1400 engines, and were flown respectively by Lieut. Cyrus Bettis of the U. S. Army Air Service and Lieut. A. J. Williams of the Navy. The other entries were two Curtiss pursuit planes, piloted by Lieut. J. T. Cuddihy and Lieut. H. J. Norton of the Navy, and a Curtiss P1 army pursuit plane, piloted by Lieut. L. H. Dawson, and a Curtiss PWS army pursuit plane, piloted by Capt. H. W. Cook. The scheme adopted by the race committee provided for the contestants to fly in two heats, and then the two fastest planes to fly in a final heat over the course unhindered. In the first heat Lieut. Bettis at the end of three laps had averaged a speed of 248.7 miles per hour, which at the close of the fourth lap increased to 248.97 miles per hour, while Lieutenant Williams made a speed of 241.695 miles per hour at the end of the fourth lap. Bettis, who thus won the Pulitzer Trophy, made a new world speed record for a closed course. The second heat was contested between four pursuit planes and determined third place in the race, being won by Lieut. L. H. Dawson with a speed of 169.6 miles per hour. The speed in the Pulitzer Trophy Race, while it was greater than in the previous year, was somewhat disappointing as it was expected that the new Curtiss racers would have been performed better.

**BALTIMORE SEAPLANE RACES.** The Schneider Trophy Race for 1925 was won by Lieut. James Doolittle, U. S. A., Air Service, in an international contest held at Baltimore, Md., for the Jacques Schneider cup. This race was held on October 26th after having been postponed on account of bad weather. The course was 217 miles in length, or 350 kilometers, and Lieutenant Doolittle, flying in a new Curtiss plane, made the distance in 56 minutes, 6.36 seconds, achieving a speed of 232.573 miles an hour, which was 55.19 miles an hour faster than the race had ever been flown before, Lieutenant Ofstie, in 1924, making in this competition 167.083 miles per hour. In addition to Lieutenant Doolittle's Curtiss plane, two other American machines competed at Baltimore, but were forced down by engine troubles, also an English seaplane, *Gloster-Napier III*, flown by Capt. Hubert S. Broad, and an Italian Macchi-Curtiss monoplane, flown by Lieut. Giovanni de Briganti. Captain Broad finished second with a total time of 1 hr. 5 min. 30.95 sec., or an average speed of 199.16 miles per hour, and Lieutenant Briganti was third, making for the course 1 hr. 17 min. 27.99 sec., with an average speed of 168.44 miles per hour.

The severe weather of the previous week had created havoc with the seaplanes assembled in connection with these races and a particularly unfortunate occurrence was the crashing of the

British Supermarine *Napier S4*, which had made some extraordinary speed records in England, including a new world speed record for 3 kilometers of 226.7 miles per hour. When it is recalled that this world record for speed was beaten by Lieutenant Doolittle for the entire 350 kilometers of the Schneider Cup Race, his performance can be appreciated. Furthermore, on October 22-27, Lieutenant Doolittle in the same Curtiss seaplane went over a three kilometer course at a rate of 245.713 miles per hour. Doolittle, in laps 6 and 7 made a 100 kilometer world record of 234.772 miles per hour and with an average of laps 4, 5, 6, and 7 made a 200 kilometer record with an average of 234.355 miles per hour.

#### NOTABLE FLIGHTS

**AMUNDSEN NORTH POLE EXPEDITION.** One of the important events of the year was an airplane dash for the North Pole organized by Capt. Roald Amundsen of Norway and Lincoln Ellsworth, an American scientist, which left King's Bay, Spitzbergen 5.15 May 21st. The plan of this expedition was to proceed to the North Pole, land and make scientific observations and then fly back to the starting point at King's Bay, Spitzbergen. The expedition was organized under the auspices of the Norwegian Aero Club and the funds were subscribed partly by that organization and partly in the United States. The equipment consisted of two naval model Dornier Wals Airplanes built at Marina di Pisa in Italy, equipped with two Rolls-Royce 270 h.p. Eagle IX engines. These machines had previously established 20 world's records, and with their engines were considered to represent the most approved and efficient types of aircraft. The party left Tromso, Norway, on April 9 for Spitzbergen, seeking to establish an advance base in the neighborhood of Danes Bay after the planes themselves had been assembled at King's Bay, but the weather and ice conditions were not as favorable as anticipated and the start was made from King's Bay without an advance base. While no radio outfit was carried, yet the equipment of the planes was ample and well considered. Fuel for twenty or more flying hours was taken together with three days' food for each man for consumption during the flight, while there were also carried 30 days' rations per man in case it was found necessary to abandon the flight and proceed on foot for Northern Greenland which was about 500 miles from the Pole.

The plan was to fly towards the Pole at an altitude of between 2000 and 2200 feet; this low level being determined on because of the weight of the gasoline. A return was to be made at a height of from 5000 to 6000 feet so that the aviators would be able to pick up Spitzbergen readily as it was a comparatively difficult spot to see in the ice of the Arctic. The plan also provided for the two planes to fly 320 feet apart side by side so that the navigators could communicate with one another by arm signals. The expedition included six members, Captain Amundsen, who had reached the South Pole in 1912 and had also discovered the North Magnetic Pole and was the first to traverse the Northwest Passage; Lincoln Ellsworth, the co-leader with Amundsen, had been an engineer in the United States and Canada

and had served as an instructor in the American Aviation School in Tours, France, during the war. Other members of the crew were Hjalmar Riiser-Larsen, a pilot and a lieutenant in the Norwegian Navy who had specialized in airship construction and aviation; Lief Dietrichson, pilot, also a lieutenant of the Norwegian Navy; Oskar Ohmdahl, mechanic, who had been an airplane pilot and mechanic for several years and had been a member of the crew of the steamer *Maud* in 1922 when an attempt was made for this ship to drift from Alaska across the North Pole; and Carl Feucht, mechanic, who was an expert on the Dornier type of plane.

After the departure of the two airplanes considerable interest was manifested which later turned to anxiety when no word was received from the explorers. Amundsen had left with his base party signed instructions in which it was provided that the two mother ships were to wait 14 days in the vicinity of Danes Island and Amsterdam Island at the conclusion of which period they were to proceed to the North and cruise along the ice barrier for a further period of four weeks. It was stated that Amundsen believed it might be possible that his return would be delayed by as much as five or six weeks and that if the planes were deserted for lack of fuel and the party compelled to return on foot it would be desirable to have a mother ship available to rescue the expedition when drift ice and open water were reached.

**MACMILLAN ARCTIC EXPEDITION.** The U. S. Navy contributed a detail of planes and personnel to the MacMillan Arctic Expedition, which went out under the auspices of the National Geographic Society (q.v.) during the summer. These planes were used for exploration and flew a total distance of more than 6000 miles in the course of the expedition, viewing approximately 30,000 square miles of territory, much of which was uncharted. See **POLAR RESEARCH.**

**HAWAIIAN FLIGHT.** The U. S. Department arranged during the year for a non-stop flight from San Francisco to Hawaii, to take place about Sept. 1. Commander John Rodgers was detailed as flight commander in the seaplane *PN-9 No. 1*, which was one of two seaplanes of similar type together with a specially built Boeing plane, which formed a squadron. The Hawaiian flight was designed to be a practical test of long-distance naval patrol planes, operated over the water and depending upon their own resources. A series of naval vessels was ordered to take position in line from San Francisco to Hawaii, at 200 mile intervals, and ships of Submarine Divisions 9 and 14 were stationed on a scouting line at Hawaii. *PN-9 No. 1* and *PN-9 No. 3* left San Francisco about 3 p.m. on August 31. *PB No. 1*, the third plane, remained behind on account of engine troubles and *PN-9 No. 3*, after proceeding about 300 miles was forced down on account of failure of the oil lines and was towed back to San Francisco by the destroyer *William Jones*. The *PN-9 No. 1* was forced to make a landing 200 miles from Honolulu on account of lack of fuel, as the favorable winds were not as strong as anticipated, and the occurrence of rain squalls produced a greater consumption of fuel than had been anticipated. When forced down, the *PN-9 No. 1* failed to reach the *Aroostook*, the nearest

station ship, on account of a rain squall and receiving wrong radio bearings. The fact of the forced landing was known by radio and the available ships on the scouting line were directed to make a search for the missing craft. Commander Rodgers, using material from the sails of his plane as sails and improvising leeboards, sailed the plane as a boat to within 15 miles of Nawiliwili Bay, Kauai Island, when they were sighted by the submarine *R-4* and towed to port. Commander Rodgers and his crew had been nine days at sea with but little food, and such water as could be caught in canvas bags during the rain and what could be made in a small still carried as part of the equipment. Commander Rodgers and his crew received many honors and congratulations for their skillful navigation of the plane on the water along with their fortitude and resourcefulness.

**OTHER LONG DISTANCE FLIGHTS.** One of the most notable flights of the year was made by the Marchese de Pinedo, an Italian aviator, who left Rome in a seaplane on April 21st and in the course of 6½ months traveled 35,000 miles, accompanied by one mechanic. For this flight he used the same machine and the first 20,000 miles were made without change of engine and with only two overhauls. His object was to demonstrate that a well built seaplane with a trustworthy engine was capable of going almost anywhere and at all seasons. He flew over the desert of Bagdad and then across the Indian plains and after passing the Malay Peninsula, made circuit of Australia and passed up to the Philippines. He reached Japan on September 26th and left on October 17th returning by Rangoon and Bangkok to Calcutta, and thence by the straightest line to Rome. The 15,000 mile return journey he accomplished in 21 days. Colonel de Pinedo stated as a result of his long trip that the seaplane was superior to other forms of aircraft for long distances in all conditions, as practically everywhere it is possible to find suitable landing stages.

Another important long distance flight of the year was planned by Alan J. Cobham, who left London on November 16th to fly to Cape Town in a De Havilland 50 aeroplane, a distance of over 8000 miles. The machine used was one in which Cobham and Sir Sefton Brancker flew to India and back, but a more powerful engine had been installed, a 385 h.p. radical air-cooled Siddeley Jaguar engine taking the place of a 240 h.p. Siddeley Puma engine.

**FORD RELIABILITY TOUR.** The first American Commercial Reliability Tour, for a trophy presented by Edsel Ford and cash prizes, started from Detroit September 28 with 17 entrants. This tour included the cities of Fort Wayne and Chicago on September 28; Moline, Ill., Des Moines, Ia., and Omaha, Neb. on September 29; St. Joseph and Kansas City, Mo. on September 30; St. Louis, Mo. on October 1; Indianapolis, Ind. on October 2; Columbus, O. on October 3; and Cleveland, O. and return to Detroit, Mich. via Toledo on October 4, when 15 of the planes arrived on schedule time. This route was 1900 miles in length and was not a contest but a straightforward tour for commercial airplanes with the manifest object of encouraging reliable and useful operation of aircraft for commercial and civilian uses. Eleven of the planes com-

pleted the tour with a perfect score and received first prizes of \$350. Four completed the tour on October 4, and received second prizes of \$125. A Mercury, Jr. completed within 30 miles of the town and won a third prize of \$100 and a Waco plane completed half the tour, having been damaged after a forced landing, being the only starter unable to go the full distance. Of the entrants 10 were small single-engined airplanes for one or two passengers, suitable for the owner pilot, there were larger cross country planes of essentially commercial type, suitable for mail carrying and long cross country service, three were commodious passenger express planes, while one combined features of the first two classes. All however were quite distinct from the military or speed types, which were seen in the usual contests. The Ford Trophy was to be inscribed with the name of the manufacturer and pilot of each plane finishing within the requirements and five such victories would entitle any manufacturer to permanent possession of the trophy.

#### AIR MAIL

**NEW YORK-CHICAGO NIGHT AIR MAIL.** On July 1, 1925, the United States Post Office Department established a night air mail service between Chicago and New York which was continued during the year. The object of this service was to provide that letters leaving either city in the evening should be delivered in the first mail of the following morning. At the New York end the mails were dispatched from Hadley Field, New Brunswick, N. J., and the regular schedule provided for the departure of the plane each night at 10.30 p.m. The first flight from New York was made in the presence of Postmaster General New. The route was divided into two stages with Cleveland as an intermediate terminal where the mail was changed and another plane and another pilot continued the westward journey. The flight from New Brunswick to Cleveland was broken at Bellefonte, Pa., where there was an operating field at which the plane was replenished with fuel, oil, and water and received an incidental inspection. On the route between New Brunswick and Cleveland 32 landing fields were available as havens of refuge, provided with high power beacons, while in between on 30 to 50 towers were routing beacons consisting of four large automobile type headlights revolving and surmounted by a stationary red light. At Cleveland the terminal field was used for the transfer of the mail to another plane and a new pilot continued the westward journey stopping at Bryan, Ohio, for fuel. At the same time the planes were leaving New York mail left Chicago and the regular service was in operation. The Trans-Continental mail was continued during the year in the United States, but it was feared that the Government might have to give it up as it was not paying on the basis of its operation.

**U. S. MAIL CONTRACTS.** An Act of Congress, Feb. 2, 1925, known as the Kelly Act, authorized the Postmaster General to ask bids from commercial air transport companies for services in connection with existing government routes. Bids were called for on eight routes, and in October Postmaster General New awarded contracts to five different operating companies to operate air mail service on five routes. These

routes were designed to supplement the existing air mail service between New York and the Pacific coast and intermediate points. The five routes were: Boston to New York, via Hartford; Chicago to St. Louis, via Springfield; Chicago to Dallas and Fort Worth; Salt Lake City to Los Angeles; Elko to Pasco. In addition there were being considered routes from Chicago to St. Paul and Minneapolis; Seattle, Wash., to Los Angeles; and Chicago to Birmingham, Ala.

W. Irving Glover, Third Assistant Postmaster General was made Second Assistant Postmaster General and made head of the U. S. Air Mail succeeding Col. Paul Henderson.

**NATIONAL AIR TRANSPORT, INC.** On May 21, 1925, was organized in Chicago the National Air Transport, Inc., a corporation capitalized at \$10,000,000, \$2,000,000 of which were sold to the organizers of the company. This company was formed largely through the interest of Howard E. Coffin, organizer of the Aeronautic Association, Chairman of the Aircraft Production Board during the World War, one of the heads of the Hudson Motor Car Company; and C. M. Keys, President of the Curtiss Aeroplane and Motor Company. The directors and stockholders were men active in the motor car, aeroplane, rubber and other industries and Col. Paul Henderson who had been in charge of the air mail of the United States Post Office Department tendered his resignation to take effect August 1 to become general manager of the new corporation.

**BRITISH COMMERCIAL AVIATION.** The report of the directors of Imperial Airways, Ltd., presented at the annual meeting held in London at the end of 1925, was of interest as showing that on the first year's workings there had been a loss of £15,217 after providing £22,998 for reserve and £63,553 for depreciation, and crediting the company with £139,410 received from the government in subsidies. During the first month of the year no services were run as a result of a dispute with the pilots, and during the second month only a skeleton service was maintained. For the remainder of the year much of the traffic was conducted on an experimental basis, as there was considerable reorganization and modification of the services. Total flying of over 825,000 miles fulfilled the subsidy agreement which stipulated a minimum of 800,000 miles, and 11,000 passengers and 600 tons of freight and mails were carried. It was stated that the Air Ministry had approved the establishment of the Egypt-India service and that not later than Jan. 1, 1927, the first machine would traverse this route.

**FRENCH COMMERCIAL AVIATION.** Commercial air transportation in France had developed extensively in the five-year period 1920 to 1924. The tendency had been to concentrate efforts on the development of long international routes rather than on short lines entirely within the country and, as a result, the number of lines, which had increased to 17 in 1922, decreased to nine in 1924. At the beginning of 1925, five large companies were operating regular air lines for the transportation of passengers, freight, and mail between France and various other European capitals.

The important changes in 1925 from the routes operated in the previous year were the extension of the Toulouse-Casablanca route to

Dakar and the altering of the routes to Bucharest and Warsaw in order to run via Basle, Zurich, and Innsbruck instead of via Strasbourg, as the German Government would not consent to French commercial air lines flying over German territory, holding that the French planes must conform to the same limitations as to size and power that were imposed on German aircraft by the treaty of Versailles and confiscated any French planes making forced landing upon German territory. The most noteworthy fact in connection with the French air transportation companies was the increase of business with the same number of pilots as in 1921 and with fewer planes. Thus in 1924, 9 air lines with 260 planes and 90 pilots, carried 16,729 passengers, 1,034,756 pounds of express and 1,174,571 pounds of mail and flew 2,266,649 miles, as compared with 285 planes, 90 pilots, 10,619 passengers, 577,368 pounds of express and 76,918 pounds of mail and total flights of 1,460,219 miles in 1921.

FRENCH CIVIL AIR-TRANSPORTATION COMPANIES, LINES, PILOTS, AND PLANES, 1920-1924

Year	Companies	Lines	Pilots	Planes
1920.....	12	10	72	185
1921.....	10	12	90	285
1922.....	9	17	86	271

GERMAN COMMERCIAL AVIATION. The limitation of the size of airplanes and the horse power of engines employed and manufactured, imposed by the Treaty of Versailles prevented Germany from securing foreign orders for the larger units, so that the tendency in 1925 was for the German air industry to concentrate on the design of planes for commercial use, in which actual performance would be considered to secure the safest, most economical, and the most efficient. Commercial aviation in Germany, however, exhibited considerable progress in the operating field and at the end of 1925 there were two air transportation companies, the Deutscher Aero Lloyd Aktien Gesellschaft and the Junker Luftverkehr. These two companies by 1925 had succeeded in dominating the principal air routes of northern, eastern, and central Europe and becoming two powerful groups with various important affiliations.

The German air lines operated planes daily during the summer season of 1925 between practically all the principal commercial and industrial centres of Europe, and the total length reached was stated at 11,067 miles, as compared with 4149 miles in 1924, 3606 miles in 1923, and 3224 miles in 1922. The German air lines in 1925 were carrying passengers, freight, and mail, but their principal income came from passenger traffic, as this had become safe and reliable. The extent to which German

air traffic, over regular routes, was carried on in the three years, 1922-1924, is indicated in the accompanying table.

GERMAN AIR TRAFFIC OVER REGULAR ROUTES, 1922-1924

Traffic item	1922	1923	1924
Completed trips...number	2,617	7,157	11,939
Miles flown.....do.	842,986	885,881	1,460,631
Passengers carried...do.	8,016	10,572	20,869
Freight carried...pounds	40,340	182,014	303,268
Mail carried...do	(b)	20,748	52,910

\* Koenigsberg-Moscow line only; freight figures for other lines not available for 1922.

<sup>b</sup> Figures not available.

EASTERN EUROPE. In Eastern Europe commercial aviation in 1925 had become quite prominent and in Warsaw, Prague, and Budapest there were important air terminals. These cities are the capitals of Poland, Czechoslovakia and Hungary, and were the terminals of long international routes, which were operated by French and German air companies. In addition they were the headquarters of smaller independent lines leading from these capitals to manufacturing and industrial centres. In these three countries the equipment used was for the most part imported from France, Holland, and Germany, but local manufacturers were encouraged to build airplanes.

BIBLIOGRAPHY. Among the books of the year were: *Mechanique de L'Air et de la Mer*. (The Mechanics

of Aviation), by Lieutenant-Colonel Alayrac, professor of mathematics in the Ecole Militaire. The book deals with the theory of aerodynamics. *The Rigid Airship*, by E. H. Lewin, London, was considered the best textbook so far produced on rigid airship designs. *Winged Defense* (New York), by Col. William Mitchell, U. S. A., was a plea for greater appropriation for aircraft and discussed the relation of aeronautics to war preparedness. *A Manual of Rigging for Aircraft* (London), prepared by the British Air Ministry explained the principles of flight. *Aeronautical Meteorology* (New York), by Willis Ray Gregg, discusses the facts of the upper air and their relation to aeronautics. *Ce que tout aviateur doit savoir* (Paris, 1924), by André Laine, was a handbook for aviators adapted to French programme of instruction in military aeronautics. *Das Leicht flug für Sport und Reise* (Frankfurt-a-M.), by H. Bechhold, dealt with constructional details of small planes. *The Strategy and Tactics of Air Fighting* (London and New York) by Oliver Stewart, discusses air combat and attempts to establish definite methods.

Also there was published during the year the *Aeronautic Safety Code* sponsored by the U. S. Bureau of Standards and the Society of Automotive Engineers, which had been approved by both these bodies after having been in preparation since 1920.

**AFGHANISTAN**, äf-gän'i-stän'. An independent kingdom of Asia between the parallels 29° and 38° 20' north latitude, and 61° and 72° east longitude, with a narrow strip extending to 75° east. The area varies in estimate from 245,000 to 270,000 square miles; population estimated at 6,380,500 although other estimates run as high as 12,000,000. Capital, Kabul, with a population of about 200,000. Other important towns are Kandahar, Herat, and Mazar-i-Sharif. The Afghan is the dominant race, and the two chief tribes are the Durrani and the Ghilzais, numbering about 2,200,000. The prevailing languages are Persian and Pushtoo, and the dominant religion is Islam.

The agricultural products include wheat, barley, rice, millet, Indian corn, a great variety of fruit and live stock including a species of fat-tailed sheep which supplies the chief meat diet of the inhabitants and great quantities of grease which is used as a substitute for butter. Minerals are reported in considerable quantities in northern Afghanistan, and coal is found in the Ghorbana Valley and near the Khura Kabul Pass. Among the industries are the productions of silks, felts, camels' and goats' hair goods, and carpets. The sheep above mentioned also supply wool and skins which are worked into wearing apparel for the natives, and constitute an important article of export.

The statistics of trade, so far as available, apply only to the trade across the boundary between India and Afghanistan. They showed in 1923-24 exports into India at £943,350; imports from India £1,725,850. Among the exports to India were: Timber, grain, fruits, vegetables, and other provisions, asafoetida and other drugs, silk, cattle, wool, hides, and tobacco. There is a considerable trade with Bokhara, but figures were not available. There are no railways, but there is a considerable mileage of road fit for motor traffic. The chief means of transport, however, is still by camels or ponies.

**AFRICA.** The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including **ABYSSINIA**; **KENYA**; **EGYPT**; **MOROCCO**; **TUNIS**; **SOUTH AFRICA**, **UNION OF**, etc. See also the articles **ANTHROPOLOGY**; **ARCHEOLOGY**; and **EXPLORATION**.

**AGRICULTURAL CONFERENCE.** See **COÖPERATION**.

**AGRICULTURAL EXPERIMENT STATIONS.** An event of unusual importance to the experiment stations in the United States in 1925 was the passage by Congress of an Act providing for increased support of these institutions over a series of years and ultimately trebling the present Federal contributions for that purpose. The steady growth in demands upon the stations and the lack of additional funds with which to meet these requirements in the face of the general increased cost had attracted attention for several years to the importance of further supplementing the Federal grants. There had been no new legislation for the stations for nearly twenty years, since the Adams Act was passed in 1906. A new relief measure had been before Congress for several years, and the President's Agricultural Con-

ference selected this as one of the most permanent means of assisting agriculture. This measure, known as the Purnell Bill, introduced and fostered by Hon. Fred S. Purnell of Indiana, became law Feb. 24, 1925.

The Purnell Act provides for an increased grant to each State of \$20,000 for the fiscal year 1926, the amount to be enlarged by \$10,000 annually until it reaches \$60,000, in 1930, when it is to be continued regularly thereafter. On maturity it will call for an annual appropriation under this Act of \$2,880,000. The appropriation is in addition to that at present provided under the Hatch and Adams Acts, amounting to \$1,440,000 a year, so that the ultimate Federal support for the State experiment stations will be \$4,320,000.

In addition to the increased Federal support, the Purnell Act broadens the field of the stations to include agricultural economics, home economics, and rural sociology. These subjects were not mentioned in previous legislation, which has related primarily to investigation by the experimental method. The new Act is very comprehensive, authorizing experiments and investigation on the production, distribution, and marketing of agricultural products "and such economic and sociological investigations as have for their purpose the development and improvement of the rural home and rural life."

The administration of the Act is in the hands of the Secretary of Agriculture, represented by the Office of Experiment Stations, and the expenditures under it are being restricted to definite projects. In preparation for inaugurating plans, a conference of experiment station directors was held at St. Louis in April, at which the principles to govern the new work were presented and strong arguments made for coöperation between the stations and with the U. S. Department of Agriculture. Six national projects of considerable range were selected, around which to organize coöperation, and special committees later outlined these with considerable definiteness. They relate to the marketing of agricultural products, including numerous subprojects, the quality and palatability of meat, food and home management, and rural social organizations. A large amount of coöperation already has been organized under these projects, and several regional projects set up. Prominent among these are a survey of New England apple production and marketing, and corn improvement in the Middle West.

In addition to the coöperative projects, over 500 independent investigations had been started by the close of the year. These not only cover a wide range, but are quite varied in character, many opening up entirely new lines of investigation. A large proportion of them provide for unusually well organized investigations conforming to the highest standards of research and giving much promise of useful results. The subjects of agricultural economics and home economics naturally come in for a large share of attention. The inauguration of research in these fields on a national scope will mark a new epoch in the history of agricultural investigation. (See *Report of the Chief of the Office of Experiment Stations*, 1925.)

The year marked the fiftieth anniversary of the beginning of experiment stations in the United States. The first station was started in Connecticut in 1875, with an appropriation of

only \$3000, part of which was from private sources. The fiftieth anniversary of this event was observed with appropriate ceremonies on the grounds of the State Station at New Haven, October 12, the session being presided over by the Governor, as President of the Board of Control, who gave a brief address on "The Agricultural Experiment Station and the State." Numerous speakers extolled the work of the station and its founders. It was deemed significant that the new legislation, which has placed the American system of stations in such an outstanding position, was coincident with this fiftieth anniversary of their beginning. (See *Experiment Station Record*, 53 p. 401.)

J. R. Farrell, Director of the Kansas Experiment Station, was made President of the Kansas State Agricultural College on the appointment of W. M. Jardine as Secretary of Agriculture, and was succeeded by L. E. Call as Director. R. Y. Winters succeeded B. W. Kilgore as Director of the station in North Carolina. Three men long prominently identified with experiment station work died during the year—Charles D. Woods, for nearly twenty-five years Director of the Maine Experiment Station, on March 30; Edwin F. Ladd, long Chemist at the North Dakota Station, and latterly a member of the United States Senate, where he served on the Committee on Agriculture and Forestry, on June 22; and H. J. Waters, former Director of the experiment station in Missouri, President of the Kansas State Agricultural College, and more recently editor of the *Weekly Kansas City Star*, on October 26.

The amount spent for agricultural education and research in England and Wales during 1925 was reported at over \$3,000,000. An experimental farm was started at Boggall, Milton Bridge, Midlothian, Scotland, with 600 acres of land, 230 of which are arable; and experiments begun with various crops and livestock. An experimental stock farm, to be known as the Duthie Experimental Farm, was provided for by gift to the University of Aberdeen. A National Poultry Institute was established in connection with Harper-Adams Agricultural College in Shropshire, under the jurisdiction of the Ministry of Agriculture and Fisheries. Funds aggregating nearly a quarter of a million dollars are available for the Institute. At the instance of the Empire Cotton Growing Corporation of Great Britain, a cotton research station was provided for in Trinidad, near the Imperial College of Tropical Agriculture.

The French Ministry of Agriculture established an agronomic research institute at Clermont-Ferrand, with laboratories for agricultural botany, genetics, plant pathology, entomology, etc. A research institute for the improvement of crops, especially cotton, was opened at Indore, Central India. A tract of 300 acres is provided, a grant of about \$75,000 for capital expenditure, and \$45,000 annually for current expenses. A cotton research laboratory for India has been established at Dharwar, including an experimental spinning mill. An additional Peruvian experiment station has been located at Chuquibamba, at an altitude of 12,500 ft. Here a ranch of about 18,000 acres is stocked with 15,000 sheep, and provided with modern equipment.

#### AGRICULTURAL EXTENSION WORK.

The nation-wide system of extension work in

agriculture and home economics, carried on co-operatively by the United States Department of Agriculture and the State agricultural colleges under the Smith-Lever Extension Act of May 8, 1914, and related Federal and State legislation, continued to grow in importance as a means of improvement of farm and home practices in thousands of rural communities. It also was a large factor in promoting cooperative marketing of farm products and more satisfactory life on the farms.

Increased attention was given to work in the interests of farm children and youth. The National Grange employed a secretary to work with young people. The National Committee on Boys' and Girls' Club work, composed of business men and farmers, renewed its efforts to coordinate all interests promoting this branch of extension work. Two dairy-breed associations employed men to cooperate with the extension agents. Commercial clubs and bankers provided funds to purchase animals and equipment for demonstrations and to procure prizes. Railroads furnished free transportation to short courses for club members and aided them in securing purebred seed, eggs for hatching, and poultry. Exhibits, demonstrations and judging contests at county, State and interstate fairs attracted much attention. Camps for young farm people, at which instruction and recreation were combined, were more numerous and better organized. Besides technical training club members learned parliamentary procedure, spoke at the meetings and received inspiration by singing.

In 1924 several colleges assembled the club songs in book form. Many of these songs are adaptations of popular melodies or old folk songs. Training schools for junior leaders were held in a number of States.

Radio receiving and broadcasting continued to grow in importance in extension work. Inquiries by the Department of Agriculture showed that about 370,000 farm families were using receiving sets. There were broadcasting stations at the agricultural colleges and affiliated institutions in 26 States and over 600 county agents had access to receiving sets from which they got weather and marketing reports, etc. The Kansas Agricultural College undertook the broadcasting of a series of lessons, somewhat like a correspondence course.

Four intensive surveys in localities in four States in which about 4000 farmers were visited showed that on about 75 per cent of their farms some improved farm or home practices had been adopted as the result of extension work. The reports of the extension agents throughout the country during the past five years showed that changes of practice due to extension work were made each year on about 3,000,000 farms.

For the fiscal year beginning July 1, 1925, \$403,139 was appropriated for the Extension Service in the United States Department of Agriculture. Of the \$19,397,000 used in the States about \$1,000,000 was derived from direct appropriations to the Federal Extension Service, \$4,580,000 from the Smith-Lever Act and \$1,300,000 from the supplementary Federal fund, making the total Federal contribution \$6,880,000. This was met by approximately \$12,517,000 from sources within the States, including \$5,400,000 to offset the regular and supplementary Smith-Lever fund, \$1,919,000 additional State and college funds, \$4,055,000 from counties

and \$1,444,000 from farm bureaus and miscellaneous sources. About \$10,138,000 was used for the demonstrations and other activities of the county agricultural agents and their leaders. Much of their work bore on the problems of the farm home but \$4,250,000 was allotted to the work of the home demonstration agents. About \$1,100,000 was used for special work among boys and girls, about \$3,748,000 for the tasks of the specialists in various branches of agriculture and home economics, \$821,000 for administration, and \$295,000 for publications.

On June 30, 1925, there were in the 48 States 2335 county agricultural agents, 987 home demonstration agents, 127 paid county leaders of boys' and girls' club work, and 930 specialists in the various branches of agriculture and home economics, with headquarters at the agricultural colleges. The white agents did much work which directly benefited the negro farmers and their families, but in the Southern States there were also 180 negro agricultural agents, 114 negro women agents and 12 negro club agents.

The work in each State was administered by an Extension Director, usually with headquarters at the agricultural college, who was a joint representative of the college and the United States Department of Agriculture. Under the 48 Directors were 58 State leaders and 121 assistant or district leaders of the county agricultural agents, 45 State leaders and 85 assistant State leaders of county home demonstration agents and 48 State leaders and 78 assistant State leaders of club work, together with the force of extension specialists. The Directors were also responsible for the management of the county men and women agents though their salaries were often paid in part from funds contributed by counties or farm bureaus. Including the supervisory officers and their assistants 4598 persons trained in agriculture or home economics, together with a considerable number of clerks, were employed in the extension work in the States in 1925. These public agents were assisted by over 172,000 voluntary local leaders in 40,000 rural communities in the several States.

The general interests of the extension work throughout the United States were promoted by the Extension Service of the United States Department of Agriculture under the supervision of the Director of Extension Work. This Service included (1) the Office of Coöperative Extension Work, which deals with the Department business under the Smith-Lever Act and related Federal legislation, (2) the Office of Exhibits, which makes agricultural exhibits at State, interstate and international fairs, (3) the Motion Picture Laboratory, which prepares scenarios and films on subjects connected with the work of the Department, especially for the use of Department and State extension workers.

During 1924 more than 7,370,000 persons were reached in the 407,074 meetings in which the agents participated. There were 1,134,750 demonstrations by farmers or members of their families under the influence of the extension agents. Exhibits of the products of the demonstrations were made in 5637 communities. Over 3,840,000 farms or homes were reported as having adopted new or improved practices as the result of activities connected with extension work. About 210,000 boys and 300,000 girls were enrolled in clubs and engaged in demonstra-

tion work in agriculture and home economics. Over 283,000 of these children completed their projects and submitted written reports. The club work was conducted by 2440 agents in the counties, who were aided by nearly 38,000 men and women as local leaders.

Some effects of extension work during the past decade were apparent on a large scale in 1924. The corn area in the eleven Western States had expanded from 793,000 acres in 1914 to 2,637,000 acres in 1923 and seed-corn selection and germination tests had become common practices on at least half of the farms in the corn belt. From 1919 to 1924 the acreage of alfalfa had increased 21 per cent and in the latter year was 10,454,782 acres. In 1909 the Census found only 1629 acres of soy beans but in 1924 there were 2,560,000 acres. In the Southern States during the past ten years 133,370 demonstrations, involving 1,673,996 acres, were made with velvet beans. Extension agents have greatly assisted farmers in combating the ravages of the cotton boll weevil and have shown in 289,669 demonstrations on 5,624,773 acres that the average yield of cotton may be doubled by improved methods of production. Through spraying and pruning, better tillage and selection of varieties, grading and improved packing of products the quality of orchard fruits on the market has been much improved. Home gardening was greatly stimulated during this period and increased comfort and health on very many farms.

In animal husbandry more than 1,500,000 purebred dairy and beef cattle, hogs, sheep, goats and horses have been put on farms on the advice of extension agents and very great assistance has been given to farmers in controlling Texas cattle fever, hog cholera, tuberculosis, black leg and other animal diseases. The poultry industry has been greatly benefited by demonstrations and other extension work relating to housing, breeding, feeding, culling, egg grading, control of diseases, etc. Terracing to prevent soil erosion has been greatly promoted in the Southern States. Effective drainage systems have been installed on over 5,800,000 acres and irrigation on over 4,365,000 acres.

In coöperative marketing the reports of the extension agents for 1924 showed that the first stage of propaganda and rapid formation of numerous organizations had passed and that the tendency was to seek to improve existing organizations rather than to form new ones. The limitations of benefit from such organizations were also more apparent. The farmers generally were therefore more interested in improving practices relating to production of crops and animals, conserving soil fertility, and bettering home and community conditions.

County farm bureaus or councils, which promoted coöperative extension work were in operation in most of the counties. Through such organizations the extension agents were able to bring about coöperative efforts for the improvement of agriculture and country life in over 40,000 rural communities. Under the influence of these agents numerous coöperative marketing organizations were formed. In 1924, 1829 such organizations reported purchases amounting to \$27,300,355 and sales to \$186,170,433.

Farmers' institutes were held in 1924 under official supervision in 22 States. In 16 States the agricultural colleges held 2201 institutes

with an attendance of 1,062,709 at a cost of \$98,867. In six States where the institutes were managed by the State departments of agriculture 1313 institutes were held with an attendance of 412,257 at a cost of \$22,341.

The negro men and women agents visited 28,410 farms and 26,515 homes, at which demonstrations were held. More than a million people attended the extension meetings. Negroes made exhibits at 815 community, county and State fairs. Over 21,000 negro boys and 27,000 negro girls were enrolled in clubs.

In Hawaii the Federal Experiment Station continued to conduct extension work on the islands of Oahu, Maui and Hawaii. Eighty-one standard boys' and girls' clubs were maintained with an enrollment of 1460 members. Vacation clubs were very successful. A garden club grew many kinds of vegetables on the grounds of the Territorial Fair at Honolulu. Canning clubs from Oahu and Maui gave demonstrations and made exhibits at this fair. Exhibits, contests in stock-judging, etc., were made by clubs at fairs on the other islands. An extension agent was maintained on the island of Hawaii. Co-operative work with the edible canna for starch production was begun on a large area not suited to other crops and pigeon pea growing, which had been very successful on Maui, was established on Hawaii. The demonstration farm at Haleakala was made a permanent enterprise.

In Porto Rico the extension work was carried on by the Insular Bureau of Agriculture, which maintained 4 district inspectors, 15 deputy inspectors and 35 agricultural agents in the several municipalities. The work consisted of lectures, demonstrations, farm visits, exhibitions of moving-picture films, etc., with special reference to soil treatment, crop rotation, seed selection, grafting, pruning, gardening, plant and animal diseases, feeding of animals and use of silos. A large number of conferences of farmers were held, usually at the rural schools. Agricultural fairs were also held. A publication entitled *Revista de Agricultura* was issued.

**GREAT BRITAIN.** In England and Wales extension work was continued through the County Agricultural Councils on plans approved by the Ministry of Agriculture and Fisheries. County agricultural organizers did demonstration, lecture and advisory work and directed the activities of specialists sent out from the Ministry, universities and agricultural colleges. Advisers in agricultural economics were appointed in a number of the 12 provinces into which England and Wales are divided for purposes of agricultural education. Each adviser has a small staff of student assistants to collect data on the economics of farm management from the cost accounts and other financial records kept by farmers and from visits to each farm in typical districts.

The training classes in pruning, spraying, picking, grading and packing fruit, held in Hereford County since 1918, have supplied a large number of men skilled in orchard work. In a number of counties women were instructed by specialists in dairying, poultry and horticulture. Instruction in handicrafts, including upholstery, glove-making, basketry, and embroidery, was conducted in connection with women's institutes and was aided by a government grant. In Derby County the women's course of 12 weeks included lessons in agricul-

ture, beekeeping, dairying, veterinary science, horticulture, and home economics. A fee is charged but those who complete the course are reimbursed  $\frac{2}{3}$  of the fee and of travel expenses. Interest in young farmers' clubs was increased and supervision of them was undertaken by the Ministry of Agriculture, but their financial support continued to come from local organizations and individuals. A government inspector and woman assistant were appointed to promote the organization and work of these clubs.

In Scotland extension work was carried on by three agricultural colleges through county organizers and specialists. Since 1923 young farmers' clubs have been organized in several counties. A government committee, appointed in 1924, recommended a more thorough organization of the extension work of the colleges. In Ireland extension work was continued under the Department of Agriculture and Technical Instructions, with specialists and county instructors.

**CANADA.** In Canada extension work by public agents and through short courses at colleges and boys' and girls' clubs was continued in the several provinces. In Quebec, after 10 years there were agricultural representatives in every rural county and the extension staff included 66 representatives, 16 assistants and 34 office secretaries. As the result of extension work farmers have larger crops, better cattle, improved farm buildings and up-to-date methods of farm practice. During this period an average of 18 women have given instruction in home economics in 420 rural parishes. Large numbers of women have been enrolled in clubs, divided into two groups for French and English speaking women respectively. Courses in sewing and cooking for girls were given in 1925 in connection with women's institutes. In 1924 there were 963 school garden clubs with over 23,000 members, divided into younger and older groups. There were also clubs for breeding, feeding and judging animals.

In Ontario the girls' clubs in connection with the women's institutes were very active and special attention was given to garment making. A number of three-months courses in home economics were given in different parts of the province.

**AUSTRALIA.** In Australia the Department of Agriculture of Victoria coöperated with the Victorian Railways in 1924 in operating the first agricultural train. This consisted of 15 cars and eight tracks and was elaborately outfitted. Cattle, pigs and poultry were carried on this train, together with many exhibits relating to crops, animal diseases, dairying, home economics, etc. Experts in the different subjects gave instruction and demonstrations wherever the train stopped. Calf clubs for boys and girls have been in operation since 1921. In Queensland pig clubs in connection with schools were begun in 1925 and supervised by the state instructor in pig husbandry of the Department of Agriculture. In South Australia women's branches of the Agricultural Bureau, first organized in 1917, are growing in favor partly because of the interest in the teaching of agriculture and home economics in the public schools. Both of these subjects are considered at the meetings of these branches.

**SOUTH AFRICA.** In the Union of South Africa the extension division of the Department of

AGRICULTURE appointed six district agents to instruct and aid the farmers in definite areas. A demonstration train was run in 1924 in co-operation with the Railway Administration. In the Transvaal boys' and girls' clubs were organized in 50 schools under the auspices of a farm organization called The Prosperity League.

INDIA. In India the agricultural departments of the various provinces continued to employ extension workers in co-operation with agricultural associations, cooperative societies and other agencies.

BERMUDA. In Bermuda boys' and girls' clubs, begun in 1917, under direction of the Department of Agriculture, have confined their activities chiefly to the growing of corn and vegetables and the preparation of animals, crops, dairy products, eggs, preserves, needlework, etc., for the annual agricultural exhibitions.

FRANCE. In France the extension organization under the Ministry of Agriculture continued its work. There were inspectors-general of agriculture in the eight agricultural regions, directors of agricultural services in the several departments (counties), and professors of agriculture or special subjects. Work in agriculture and home economics for women and girls was included. Agricultural associations also carried on much extension work. The *Foyer Rural*, an association founded during the World War to help women to fit themselves to manage farms, added home economics instruction to its programme in 1922. Courses for women and girls of the educated classes are held at the headquarters of the association in Paris from January to Easter. Demonstrations are conducted throughout the year through visits and sojourns at well-ordered farms where good methods of agricultural and home practices are observed and practical training is given to select students. Specialization in dairying, horticulture, poultry husbandry, etc., is permitted.

Under the law of Apr. 5, 1923, providing for agricultural instruction by motion pictures a permanent committee on agricultural cinematography was appointed, which established co-operation with the ministries of agriculture and education, ascertained what films were at the disposal of publishing houses and worked out a programme for new films. The Ministry of Agriculture established a central depository in the Pedagogic Institute of Paris and a collection of films in each of the eight agricultural regions. Lists of available films were published and distributed. Films are loaned free of charge to educational institutions, agricultural and other public associations, and individuals. In 1924 the Government contributed 500,000 francs for this service.

BELGIUM. In Belgium extension work continued to be carried on by the Ministry of Agriculture through numerous specialists in agriculture, veterinary medicine, forestry and farm housekeeping. Administrative reforms put into effect since the end of the World War have greatly promoted the efficiency of this work. There is now a more permanent personnel and special efforts are made to provide members of the staff with up-to-date information relating to their respective subjects.

DENMARK. In Denmark extension work continued to be carried on by the Department of Agriculture, the Royal Agricultural Society and about 120 local farm organizations.

THE NETHERLANDS. In the Netherlands extension work was carried on under direction of the Inspectors of Agriculture and Agricultural Instruction in the Department of Agriculture. Agricultural and horticultural advisers were located in the 11 provinces, together with specialists in dairying, animal husbandry, poultry and beekeeping.

SWITZERLAND. In Switzerland the Swiss Peasants' Union conducted extension work through officers who traveled among the farmers, delivered lectures, and gave oral and written information on agricultural subjects.

SPAIN. In Spain the Union of Catalonia conducted extension work through the Technical Service Branch of the Department of Agriculture.

ALGERIA. In Algeria under the Department of Agriculture, Commerce and Colonization, chiefs of agricultural service in each of the three provinces, assisted by agricultural advisers in the smaller districts, carried on extension work among the European farmers and through societies of nations, whose members farm under contract.

GERMANY. In Germany illustration or demonstration farms have greatly grown in favor as a means of giving practical information to farmers. Such farms began to be used in Prussia and Pomerania before the War but are now maintained in a number of other provinces. These are farms which the owner agrees to operate for a term of years under the supervision of the Chamber of Agriculture, which contributes toward the operating expenses of the farm. The farmer keeps accounts according to a system agreed upon and permits members of agricultural schools and societies and other interested persons to visit his farm. In the Province of Brunswick young people's societies were begun in 1923 and two years later had several thousand members. Monthly meetings for instruction and recreation were held and outdoor sports were encouraged. In 1925 the agricultural chamber of this province held a six-weeks course in bookkeeping for farmers' daughters.

CZECHO-SLOVAKIA. In Czecho-Slovakia a law of 1922 provided for the promotion of agriculture by the establishment of a chamber of agriculture in each of the five provinces and an agricultural association in each county. The executive bodies of the chambers are composed of one delegate from each county association and representatives from other agricultural societies. The chambers supervise the work of county associations, whose members include farm owners or tenants, men and women laborers, agricultural teachers and officials, veterinarians, etc. Membership is compulsory and the expenses are met partly by taxes of members and partly by government contributions. Among the objects of the associations are the investigation of agricultural conditions, stimulation of agricultural production, promotion of cooperative societies, organization of agricultural instruction, publication of bulletins, and organization of expositions and contests. A law of Jan. 29, 1920, provided for after-school instruction of young people of both sexes. Under this law agricultural instruction has been introduced in many rural schools. Winter agricultural courses are also provided for soldiers in service.

ITALY. In Italy under the royal decree of

July 29, 1925, an extensive campaign to increase grain production was inaugurated. The annual budget for the itinerant teachers was increased by 3,500,000 lire and more than 100 additional teachers were employed. Contributions to this work were received from local organizations. In each province a special commission to supervise the propaganda and demonstration work was established, consisting of the technical heads of agricultural associations and institutions and a number of farmers representing various farm organizations. The director of the itinerant teachers, or his delegate, is secretary of the commission. Demonstration fields were established in many communes and 7,500,000 lire were appropriated for their maintenance. The formation of associations for seed production and distribution was encouraged by an appropriation of 5,000,000 lire. Provision was also made for the loan and purchase of farm machinery for grain production and prizes were offered for competitive contests in grain growing.

**JAPAN.** In Japan extension work was carried on through the experiment stations under the Department of Agriculture and Commerce and also by local authorities and agricultural societies subsidized by local, provisional or general governments. The Department of Education furnished some teachers from high schools to give demonstrations and instruction during the summer vacation at the request of agricultural societies.

**GUATEMALA.** In Guatemala the Department of Agriculture established in 1920 gives land-owners oral and written advice on agricultural subjects; its officials sometimes visit plantations and demonstrations are held at the six experimental farms.

**HAITI.** In Haiti the Technical Service of the Department of Agriculture employs seven agricultural agents to do extension work in different parts of the country. A number of coöperative demonstration farms have also been established.

**AGRICULTURAL LEGISLATION.** By far the most important legislative accomplishment of the year was the passage on February 24 of the Purnell Act for increased Federal support of the agricultural experiment stations. This measure is discussed elsewhere (See **AGRICULTURAL EXPERIMENT STATIONS**), as is also the annual act making appropriations for the support of the Federal Department of Agriculture (See **AGRICULTURE, U. S. DEPARTMENT**).

A resolution declaring agriculture to be the basic industry of the country and directing the Interstate Commerce Commission to investigate thoroughly the existing freight rate structure with a view to effecting such changes as would promote the freedom of movement of farm products affected by the prevailing agricultural depression, including livestock, at the lowest possible rates compatible with the maintenance of an adequate transportation service, was signed by President Coolidge January 30. This resolution had received the indorsement of the President's Agricultural Conference (See **AGRICULTURE**), as had also an emergency resolution, approved March 3, authorizing the Secretary of Agriculture to waive all or a portion of the grazing fees for the use of National Forests in drought-stricken regions in 1925, and an act, approved March 4, amending the Agricultural Credits Act of 1923 by granting agricultural

credit corporations chartered by the United States Government the same discount privileges in the Federal intermediate credit banks as were given to institutions chartered under State laws. This last named measure was advocated as a means of relieving the credit situation in livestock regions by financing the organization of properly capitalized livestock loan companies.

Numerous other measures of interest to agriculture were considered during the closing weeks of the Sixty-eighth Congress, but on its final adjournment on March 4 very few had been adopted. Thus, as regards the promotion of coöperative marketing, in which there was great interest, bills providing Federal assistance received favorable reports in both houses, and one of these passed the House and was reported to the Senate with amendments, but failed of further consideration. Modified forms of the McNary-Haugen bills, defeated in 1924, for the stabilization of the home market by the establishment of an agricultural export corporation for the handling of the surplus, were likewise favorably reported to both houses, but considered by neither. The bill which passed the House March 24, 1924, and provided for the disposition of the Government's Muscle Shoals holdings, in which much interest was taken by agricultural organizations because of the possible utilization of this property for the manufacture of fertilizers from atmospheric nitrogen, was adopted in radically different form by the Senate on January 14. Conference reports, however, designed to harmonize the wide differences in policy proposed, failed of adoption, and the only action to be completed on the subject was the adoption of a House resolution on March 2, asking the President to appoint a Muscle Shoals commission to determine the most desirable means for production of nitrates for fertilizers in time of peace and explosives in time of war.

Several measures dealing with cotton statistics and the marketing of this commodity received favorable consideration by the Senate, but were not acted on by the House. Some attention was also given to the influence of foreign agencies on American farm products. A Senate resolution providing for a report by the Federal Trade Commission on the activities of the Empire Cotton Corporation of Great Britain was adopted January 27, as was also a resolution on February 9 directing the Federal Trade Commission to investigate the dealings and relationships of the American Tobacco Company and the Imperial Tobacco Company with reference to tobacco growers' coöperative associations.

With the convening on December 7 of the Sixty-ninth Congress, most of the earlier bills were reintroduced, as well as many new ones, and at the end of the year about 50 measures were pending. Several of these aimed to afford additional Governmental assistance to agricultural coöperative undertakings, and legislation during the session along this line appeared quite probable. The strengthening of the Department of Agriculture in this respect, "not to undertake undue regulation" but "equipped to give prompt information on crop prospects, supply, demand, current receipts, imports, exports, and prices," was specifically recommended by President Coolidge in his opening message.

Much less unanimity of opinion still prevailed

as regards the various proposals for agricultural relief through the handling of surplus products by a central agency, although there were increasing indications that the importance of an adequate solution of this problem was becoming more and more widely recognized. The view was expressed by President Coolidge in his message that farmers "do not wish to have meddling on the part of the Government or to be placed under the inevitable restrictions involved in any system of direct or indirect price fixing which would result from permitting the Government to operate in the agricultural markets."

The American Farm Bureau Federation endorsed "the enactment of a Federal law based on the principle of a farmers' export corporation, providing for the creation of an agency with broad powers for the purpose of so handling a surplus of farm crops that the American producers may receive an American price in the domestic market," and instructed its officers and representatives to work for "the early enactment of such a law founded on sound economic policy and not involving Government subsidy." At the close of the year this presenting this and other points of view were being prepared for presentation, and there were indications that some of them would be pressed vigorously for passage.

Another question which seemed likely to receive serious attention was that of the formulation of a leasing system on the unappropriated public domain for grazing purposes and the adoption of a uniform grazing policy. Such action had been recommended by the President's Agricultural Conference and received his indorsement in his message to Congress. The 1925 report of the Secretary of Agriculture indicated as the four subjects which still stand out prominently as suggesting a need for legislative or administrative action, those of the utilization of the public domain, freight rates, taxation, and cooperation.

The legislatures of most of the States met in 1925, but the agricultural legislation of general interest was not large. The operation of co-operative marketing associations was encouraged in California, Idaho, Maine, New Hampshire, New Mexico, and Iowa. Commission merchants handling farm products were further regulated in Idaho and Missouri, and warehouses in South Dakota.

Increasing interest in the standardization of farm products was reflected in a new and comprehensive fruit and vegetable standardization act in California, a similar law in Missouri, potato grading and inspection in Oregon and Wyoming, maple sugar grading in Vermont, pure egg laws in Oregon and Utah, and amendments as to apple grading in New Hampshire, as well as in the "truth-in-fabrics" law of Wyoming, requiring statements as to the quantities of virgin wool present in fabrics.

Other inspection laws dealt with dairy products in Arizona, Connecticut, Idaho, Kansas, South Dakota, and Vermont, feeding stuffs in Connecticut and Oregon, bee registration and apiaries in Montana and New Hampshire, seeds in New York, Utah, and Vermont, orchards in Oregon, and weeds in Utah. Arizona revised its livestock code, and Missouri and Ohio strengthened their laws for the suppression of bovine tuberculosis. West Virginia took similar action as regards the apple rust disease.

In an effort to stimulate the growing of improved strains of cotton, California restricted growers in certain districts to a single variety, Acala. Authority to buy and sell to farmers nitrate of soda and agricultural potash was given the State warehouse commissioner in South Carolina, while in Oklahoma the warden of the State reformatory was empowered to grow and sell seeds. South Dakota reorganized its department of agriculture, and Missouri established a State plant board. Arizona authorized the formation of corporations for research in agriculture and related subjects. Territorial funds in aid of agricultural fairs were provided in Alaska (q.v.).

**AGRICULTURE.** The improvement in the agricultural situation in the United States noted in 1924 continued in moderate degree during 1925. On the whole, the condition was more favorable than in any other year since 1920. The heavy movement of rural population away from farms was checked, and noteworthy progress was made in the liquidation of indebtedness among farmers. Agricultural production was well balanced, and the surpluses of cattle, hogs, corn, wheat, and certain other crops, which depressed the markets during and following 1920, were largely worked off. As a result of this and other conditions, prices of farm products rose to higher levels, farmers receiving better prices than at any time in the past five years. The Department of Agriculture noted that the average of all farm prices for October was 143 per cent of the pre-war average, as compared with 138 per cent a year ago. The purchasing power of these products in terms of non-agricultural products, on the basis of the pre-war average of 100, rose from 66, the lowest point of the depression period, to 87 in October, 1925. Livestock producers were placed in a more favorable position by an average increase of 60 per cent in hogs during the first half of 1925, as compared with 1924, and a continued advance in cattle prices, showing that the tide had definitely turned.

While the farmers had not reached an economic parity with other great groups of producers, the economic position of agriculture, as measured in terms of income, promised to be at least equal to, if not slightly greater than, that of the preceding year. There was considerable improvement in income over previous years for the crop year 1924-25, particularly in areas which are large producers of wheat and hogs. Taking into account all farm production, the Department of Agriculture estimated that the crop year 1924-25 represented an advance in gross income from \$11,300,000,000 to \$12,100,000,000, or an increase of 7 per cent. These figures are above those during the depression, but below the earnings of normal years. The agricultural exports for the year ended June 30, 1925, were 21 per cent greater in volume than in the preceding year, and 26 per cent greater than the average for the five years just previous to the outbreak of the World War. The value of the agricultural exports was more than double that of any pre-war year, and greater than in any year since 1921.

**AGRICULTURAL SITUATION.** While agricultural conditions in the United States had improved steadily since the collapse of 1920, it was pointed out by the Secretary of Agriculture and the Secretary of Commerce that the permanent sta-

bilization of American agriculture had not been reached simply because farm prices were temporarily high. This would require the reduction of various agricultural surpluses and their maintenance within manageable proportions. Agriculture cannot adjust its production in relation to supply and demand as rapidly or safely as most other industries can. A great deal had been done toward adjusting production to anticipated market requirements, but it was inevitable that surpluses of agricultural commodities would be produced from time to time, no matter how carefully crops and livestock might be regulated in accordance with forecasts of supply and demand.

The great industry of wheat farming is still unstabilized because the average annual surplus is too large to be manageable. This makes the American farmer almost entirely dependent upon foreign demand and crop production throughout the world. As European agriculture recovers, a tendency to reduce imports may be expected. The large crops of grain harvested in Europe in 1925 may have such an effect. Hence adjusted production to reduce surpluses was emphasized by the Department of Agriculture in order to restore proper balance between the prices of farm products and the prices of other commodities. Such an adjustment gradually has been going on as a result of information which the Department of Agriculture has disseminated relative to production and movement, prices and consumption of farm products.

CANADA. The Dominion of Canada has a total area of some two and a quarter billion acres, but the area fit for cultivation was estimated at less than 30 per cent of the whole, or approximately 631,000,000 acres. Of this not more than 10 per cent has been brought into improved condition, so that the possible development of the agriculture is very large. Sixty-four per cent of the total cultivated area is in the three prairie provinces of Manitoba, Saskatchewan, and Alberta, three-fifths of which is devoted to wheat. (*Journal of the Ministry of Agriculture*, Aug. 1925, pp. 438-447.)

Ontario provided for assisting settlers in its colonization area of North Ontario, and for the erection and operation in that area of creameries, cheese factories, and like associations. Former soldiers to the number of more than 30,000 have been established on farms of their own, four-fifths of whom have received loans.

GREAT BRITAIN. In England and Wales, agriculture was reported to be receiving grants amounting the past year to £4,500,000. The British government had spent about £15,000,000 in settling some 30,000 ex-service men and their families on the land, and, in addition, has spent £4,000,000 since 1919 in making good the subsequent losses of county councils on their small holdings estates. A still further shrinkage of £6,000,000 was expected, attributable to overcapitalization of the holdings. This would represent about £38 per acre, or over £550 per tenant. The Ministry of Agriculture also engaged in direct farming operations, and these ventures had proved expensive. The government was attempting to relieve its situation by encouraging emigration. An arrangement was entered into with Canada for assisting settlers, and an agreement with Australia to take over large numbers under a colonization scheme. The Australian government undertook to spend

nearly \$200,000,000 in preparing land for settlers, to be sold on easy terms, while the Imperial government was to provide for transportation costs and to advance considerable sums of money, to be repaid in installments.

There had been no diminution in the practice of laying down land to grass in Great Britain, despite the efforts during the War, the cultivated area in 1925 being 381,000 acres less than in 1914. Farmers claim they are unable to pay the wages of labor and are resorting to this means to reduce costs. A special committee of the Council of Agriculture for England reported during the summer in favor of granting a subsidy for the cultivation of land, to apply to land under bare fallow or fallow crops. The four-course rotation is taken as the basal one. The suggested subsidy was at the rate of two pounds per acre, which, based on about one-fourth the area of cultivated land, would, at the outset, cost in the neighborhood of £5,000,000 for England and Wales. This proposal brought out much discussion, especially from the urban press.

In an address to 30,000 farmers, in September, Lloyd George proposed that, for the better use of land, partly as a relief from unemployment, and for making the country more self-sustaining, the government resume its ownership of land, abolishing the present landlord and tenant system and setting up in its stead a system of "cultivating tenure." The land would be rented to the actual farmers, who would be deprived of their tenancy if they failed to make good use of the land. In addition, he proposed a system of government credit to enable the farmers to efficiently equip their farms. He believed that this scheme would, in fifteen years, practically solve the problem of unemployment and make the British people independent of foreign food supplies. He calculated that, on the Danish basis of cultivation, the soil could support another 750,000 workers, and on the Dutch basis, 1,750,000. The Irish Free State met with opposition to its plan to grant a subsidy of £3 an acre a year for all new land put under tillage.

DENMARK. A Danish law passed in 1924 provided for assistance in securing small holdings of land. The minimum is 5 acres, but there is no maximum. Loans may be made from state funds for purchasing land up to nine-tenths of its mortgage value. Provision is also made for the extension of existing holdings, farm buildings, etc.

JAPAN. The food and population problem continues a serious one in Japan. The Department of Agriculture and Forestry decided that the government should revise the regulations for opening up and bringing land under cultivation. While the area of land and volume of foodstuffs have been materially increased, the rate of increase has fallen off lately and is not keeping pace with the increase of population. Consequently additional inducements are to be offered settlers in districts still open to cultivation. Agriculture in Korea was said to have made great strides in the 15 years since it came under the administration of Japan. The exports then amounted to 15,000,000 yen per year, and in 1925 to over 200,000,000 yen. The rice crop had increased rapidly.

AFRICA. Interest was being attracted to the possibilities of large development in South and East Africa. South Africa was emerging from

its pioneer stage, and the agriculture was becoming quite highly diversified. Dr. H. L. Shantz, who recently made explorations in East Africa, reported that the cultivated acreage could in time almost equal that of the United States, and that the climate and soil of the uplands were similar to those of this country, enabling the growing of crops of like character.

**AGRICULTURAL COMMISSION.** The Commission appointed by President Coolidge in November, 1924, commonly known as the President's Agricultural Conference, rendered a report early in the year, which gave much consideration to matters relating to marketing, especially through coöperation, recommending that coöperative associations be permitted to form commodity pools and to carry out programmes of orderly marketing. It advised that coöperative associations be allowed to develop without Government interference or domination, but, in order to foster and assist coöperation, the provision of a commission was recommended. Reference was made to tariff adjustments to protect agricultural commodities, and certain legislation affecting agricultural credits and the rediscounting of paper was suggested. See **AGRICULTURAL LEGISLATION.**

The Conference strongly emphasized the basic importance of agricultural research, and of the agricultural experiment stations as fact-finding institutions. It recommended the passage of the Purnell Bill, then in Congress, providing for increased appropriations for the stations, and raised the amounts to be provided under that bill. (See **AGRICULTURAL EXPERIMENT STATIONS.**) This was the most important legislative suggestion acted upon by Congress.

The Conference continued in existence until fall, when improved conditions led to the conclusion of its work.

**THE CROP YEAR.** Drought of unusual severity in some sections of the United States largely reduced yields of grain and other crops in 15 States, but outside of these areas the yields were good, although not sufficient to bring up the averages. Because of this the yields of grain for the whole country were slightly below the previous ten-year average. The wheat crop was the smallest since 1917, and in proportion to population the smallest since 1890. It was estimated December 22 at 669,365,000 bushels, which is approximately 193,000,000 bushels less than in 1924.

The corn crop, estimated at 2,900,581,000 bushels, was nearly one-fourth larger than in the preceding year and of much better quality, but in amount was less than the five-year average. The low price was a matter of much concern. In some localities, notably Iowa, the bankers organized to aid farmers in holding for better prices. The oat and barley crops were about 11 and 25 per cent, respectively, above the averages of the past five years, but the hay crop was the smallest since 1918. Potato production, 323,243,000 bushels, was one-fourth less than that of 1924, which was greatly in excess of domestic needs, and about 10 per cent below the five-year average. It was the smallest crop since 1919 and in proportion to population was even smaller than the crop of that year. It was also unusually poor in quality. The sweet potato crop amounted to only 63,474,000 bushels, and the production was the lowest since 1914. A large acreage was planted but drought cut down the yield to the lowest for 15 years, with the

exception of 1924. The flaxseed crop of 22,007,000 bushels was much below that of last year because of sharp reduction in both acreage and yield, but the production was about 50 per cent greater than the average for the preceding five years. Buckwheat was a fairly good crop, and rice production was not far below the average. Rye, sugar beets, and clover seed all gave low yields.

The cotton crop was the third largest ever grown in the United States, estimated at the end of December at 15,603,000 bales, exclusive of linters. It was exceeded by the 1914 crop by about half a million bales, and was within 90,000 bales of the 1911 crop, the second largest on record. This large production resulted in spite of boll weevil infestation, which was less than usual. The acreage was the largest ever grown, over 46,000,000 acres being planted, of which about 4.6 per cent was abandoned. Late fall weather was unusually favorable to continued ripening of the bolls, but materially lowered the quality, the later pickings being less desirable. The yield and quality of tobacco were unusually good in practically all cigar leaf producing areas, while for other areas the reverse was largely true. Preliminary estimates were somewhat below the five-year average.

Wheat production in 32 countries of the Northern Hemisphere was estimated in November at 300,000,000 bushels more than in 1924, namely 2,953,000,000 compared with 2,684,000,000 bushels in 1924 and 3,022,000,000 bushels in 1923. Considerable confusion arose regarding the world's supply, due to earlier claims of Russia that it might export 300,000,000 bushels, a figure later reduced to 60,000,000, with actual shipments up to the close of the year much below this. Failure to produce a larger quantity for export had a serious effect upon Russian trade, the Soviet Government canceling orders previously placed in the United States and elsewhere for machinery. Growing conditions in Argentina were unusually good during the season, and the outlook for the crop was favorable. Drought in Australia was serious in some districts, many complete failures being reported in Victoria and New South Wales. The wheat crop of the Commonwealth was estimated at 2,700,000 metric tons, as compared with 4,400,000 metric tons last year and a yearly average of 3,000,000 metric tons for five years.

France was approaching a point where its wheat production would meet national requirements. The 1925 crop was an abundant one, but as France produces only soft wheat, it will be necessary to import a quantity of hard wheat. Under a law passed at the close of 1924, customs duties were imposed on wheat imports, but were refunded upon proof that the cereal was used for consumption in France.

Forecasts in December were for a considerably larger world cotton crop than in 1924. Larger crops were expected in Egypt, Russia, and Anglo-Egyptian Sudan, and a smaller crop in Mexico. Conditions were reported as generally favorable in other cotton-growing countries, except Brazil. (See also individual crops.)

**CROP ENEMIES.** The plant disease and insect pests prevalent in the United States take a large toll of the national income of American agriculture. The U. S. Bureau of Plant Industry estimates that one out of every 12 wagonloads of wheat is lost by reason of diseases of the

wheat crop. The cotton crop pays even more dearly, for the diseases of the cotton plant take one bale out of every eight. Nearly one bushel of Irish potatoes is lost out of every five, and over one bushel of sweet potatoes in every six. Diseases of the corn plant take about one bushel in eleven.

Stem rust is the most serious ailment of wheat and rye, while root and ear rot cause most of the damage in corn. Leaf roll and other diseases of the leaf are the most important in the case of potatoes. There has, however, been much gain in combating these troubles. In the five years from 1919 to 1924, the loss of wheat from plant diseases dropped from 17 to about 9 per cent. Losses in sweet potatoes dropped from 36 per cent in 1919 to less than 18 per cent in 1922, while cotton losses fluctuated from 14 per cent to 19 per cent in that time.

COÖPERATION AND MARKETING. "The most distinct and significant movement in American agriculture in this decade is the almost universal trend toward coöperation in the marketing and distribution of farm products." This was the statement of the Secretary of Agriculture, who pointed out that it is in no sense a regional or sectional movement, but exists in all sections and is participated in to some extent by producers of practically all kinds of farm products. Within the last decade in particular, the movement has assumed proportions which indicate that it is a response to a fundamental and universal need of present-day agriculture. It expresses the view that group action in marketing must be added to individual efficiency in production if the high standards of American farm life are to be preserved and agriculture is to maintain its proper place in our national life.

It has come to be widely realized that to place agriculture on a stable and profitable basis involves recognition of the inseparable relation between production and marketing. In order to become more readily responsive to the market demands, it is now held that organizations for marketing need to be developed through sound farmer-owned and farmer-controlled associations. This involves better merchandising methods, including proper grading of farm products and standardization of grade and pack, which can be effected more readily when farmers are organized into groups. Such practices reduce the cost of getting commodities to market and aid in stabilizing markets, avoiding gluts and reducing waste.

The business transacted by coöperative buying and selling organizations during 1925 was estimated by the U. S. Department of Agriculture at \$2,500,000,000, approximately one-fifth of the total agricultural output. The average business of coöperative associations more than doubled between 1913 and 1922. The business of tobacco marketing associations, for example, increased from an average of \$142,000 in 1913 to \$7,606,000 in 1922, and of cotton associations from \$191,000 to \$3,406,000 in 1922. During the past decade coöperation has been evolving from the local type of organization into associations and federations covering large areas and handling business totaling millions of dollars annually. Although 95 per cent of the coöperative associations are still local organizations, approximately one-third of the whole business at the present time is carried on by one hundred of the federations and regional organizations.

These, from a business point of view, are the dominant factors in coöperative marketing. The increase in volume of business has brought about, on the whole, economies in operation, a greater insistence on standardized products, and easier financing, and has encouraged capable executives to enter the service of coöperative associations. Important features in the extension of coöperation are the development of a coöperative spirit throughout the rural communities, a knowledge by individual producers of its possibilities and limitations, and a better understanding and appreciation of the coöperative movement by the general public.

The Federal Government was believed to have an important part in connection with the coöperative movement, but it is recognized that the latter should not be hampered by Government regulations. Supervision and control were not regarded as desirable, and removing responsibility for actions from the coöperative associations themselves might be fatal to their efficiency. The Government might, however, aid these organizations in various ways, and this it was engaged in doing, through the Department of Agriculture, examining causes of success and failure in coöperation, helping by advice in the development of effective organizations, analyzing marketing operations to discover their weak and strong spots, aiding coöperatives to extend their markets at home and abroad, acquainting them with the experience of coöperators in other countries, furnishing marketing news services, establishing commodity grades and standards to facilitate trading, and helping producers to correlate their production plans. See also *Report of the Secretary of Agriculture, 1925*.

The plan for the establishment in the Department of Agriculture of a new Division of Coöperative Marketing in the Bureau of Agricultural Economics was adopted in November, after conference with representatives of coöperative organizations with a membership of more than 2,000,000 farmers. The new Division would carry on research in coöperation, and extend the Department's services to coöperative organizations. Authority for its establishment was sought from Congress.

The first session of the American Institute of Coöperation was held at the University of Pennsylvania July 20 to August 15. In the four weeks of its session the Institute brought together Cabinet Officers, scientists, experts, and managers of coöperatives, who lectured to groups of men and women from all parts of the Union. The purpose was to help to unify and clarify the coöperative movement, and serve as a means of training and developing leaders and workers.

A report of the conference held at Wembley, England, in July, 1924, was published in a book entitled "Agricultural Coöperation." In an introduction Sir Francis Plunkett, who for 35 years had been active in developing coöperation in Ireland, took for his text the Irish formula, "Better farming, better business, better living." He declared that what the best government could do for farmers was of insignificant importance compared with what, by intelligent and loyal coöperation, they could do for themselves. The report says that the number of coöperative societies increased from 25 in 1901 to 1079 in 1922, and the turnover from

\$9467 to \$11,352,171. The wheat pools in Canada had a successful year, the three provincial pools marketing all their grain through one central selling agency. The educational work done by pioneer farmers' companies over a period of years paved the way for the pools and made possible their organization and operation.

The gigantic Grain Marketing Company, organized last year under the leadership of the American Farm Bureau Federation, failed of success. The plan involved the merging of five large grain companies of Chicago and Kansas City at a contemplated capital outlay of \$26,000,000. The merger was affected on a temporary basis, with a year's lease of the five companies it was proposed to buy, the new company to handle the aggregate trade of these companies. The difficulty was attributed to the failure of the plan to sell \$4,000,000 of stock to farmers, which led to the dissolution of the company in July. This was a difficulty which had been anticipated by many from the outset.

**INSTITUTE OF LAND ECONOMICS.** The Institute for Research in Land Economics, established by Dr. Richard T. Ely at the University of Wisconsin, was removed to Northwestern University at Chicago, Dr. Ely retaining leadership. The securing of strong financial support of its work from a wealthy foundation will insure considerable enlargement of its activities. Problems to which the institute will direct itself include the proper balance between the improvements to be put upon land and the value of the land, the question of farm rent and rent regulation, the relation of changes in land values to changes in population, farm tenancy and the place it should occupy in the general system of land tenure, and the trend of living habits in American communities as they affect housing requirements.

**AGRICULTURE, UNITED STATES DEPARTMENT OF.** Dr. William Marion Jardine, president of the Kansas State Agricultural College, became Secretary of Agriculture, Mar. 4, 1925, succeeding Howard Mason Gore, who then became Governor of West Virginia. Secretary Jardine was born Jan. 16, 1879, in the Malade Valley of Idaho, spent much of his boyhood on a cattle ranch in the Big Hole Basin of Montana, graduated at the Utah Agricultural College in 1904 and taught agronomy at that college until he became assistant cerealist in the Department of Agriculture at Washington in 1907. He was made head of the department of agronomy of the Kansas Agricultural College in 1910, three years later dean of that college and in 1918 its president. On Apr. 1, 1925, Renick W. Dunlap of Ohio, a graduate of the College of Agriculture of Ohio State University and former State dairy and food commissioner and Secretary of the State board of agriculture, became Assistant Secretary of Agriculture. Dr. C. W. Warburton continued as Director of Extension Work and W. G. Campbell as Director of Regulatory Work. Dr. E. D. Ball, Director of Scientific Work, retired from that position July 1, 1925 and it remained vacant. The Office of Publications and the Press Service were united in an Office of Information, of which N. A. Crawford became director. The business offices of the Department were brought together in an Office of Personnel and Business Administration, of which Dr. W. W. Stockberger was appointed director. The personnel of the De-

partment was approximately 20,587, of whom 4810 were located in Washington.

The Department enlarged its work relating to cooperative marketing. Besides studying marketing problems, it made surveys indicating the prospects of various cooperative projects, examined the causes of success and failure in co-operation, analyzed marketing operations, aided cooperatives to extend their markets at home and abroad, acquainted American cooperators with the experience in co-operation abroad, furnished market news service, established grades and standards for various products, and by counsel and advice helped farmers to develop effective marketing organizations.

The Secretary defended the policy of the Department in the administration of the Plant Quarantine Act of 1912. During four years prior to the passage of that act six major pests gained entry and establishment in the United States, namely, the oriental fruit worm, Japanese beetle, citrus canker, potato wart, European corn borer, and camphor scale. After seven years' trial of unlimited entry of plants under foreign inspection and partial reexamination here, the large number of pest interceptions with imported material made this system too dangerous. This led to the present policy of restricting the entry of foreign plants to horticultural, educational and scientific needs, which permitted safer control. Even with this restriction nearly 50,000,000 plants have been admitted during the past six years.

Under regulations of the Secretary of Agriculture, without special legislation by Congress, 31,000 livestock owners ranged about 1,800,000 cattle and 6,500,000 sheep in the national forests for varying portions of the year. As an aid to settlers near these forests the ranges within them now contribute to the maintenance of about 4,500,000 acres of cultivated land and 22,000,000 acres of grazing land in private ownership.

During the fiscal year ended June 30, 1925, 11,329 miles of road were completed under the Federal Road Aid Act of Nov. 9, 1921, making a total of 46,486. In addition, 12,463 miles were under construction. The total cost of the projects completed during the year was about \$243,000,000, of which \$111,000,000 was paid by the Federal Government. The entire mileage completed since 1917 cost over \$845,000,000, with a Federal contribution of about \$373,000,000. Meanwhile Federal taxes on motor vehicles, tires and accessories have yielded \$800,000,000. The license fees for motor vehicles and gasoline taxes during the last fiscal year yielded more than enough to pay the States' share of the cost of Federal-aided roads in all the States, except New Mexico.

For the fiscal year 1925 the total expenditure for the regular work of the Department was \$43,908,613. Approximately \$10,000,000 were used for research; \$2,400,000 for extension work; \$8,600,000 for eradication or control of plant and animal diseases, insects and other pests; and \$13,300,000 for service activities. Funds amounting to \$5,306,392 were received and deposited in the Treasury, of which \$4,502,955 were from business in the national forests. The other funds administered by the Department aggregated \$120,486,396, of which \$107,500,000 was for Federal-aided roads and forest roads and trails, \$1,440,000 for experiment stations, under the Hatch and Adams Acts, \$5,880,000

for extension work under the Smith-Lever Act, \$4,500,000 for local road and school purposes, and \$1,200,000 for forest purchase and conservation under the Weeks Act.

The Appropriation Act for the fiscal year ending June 30, 1926, carried \$124,774,441, of which \$80,000,000 was for roads. Including supplementary deficiency appropriations, the amount available for the regular work of the Department was \$45,614,441. To this must be added continuing appropriations, including \$3,000,000 for meat inspection, \$1,539,000 for extension work under the Smith-Lever Act, \$960,000 for experiment stations under the Purnell Act, and \$4,760,750 for various forestry purposes. Including appropriations in the Deficiency Act of Mar. 4, 1925, the total funds for the Department for the fiscal year 1926 amounted to \$145,709,191.

For the fiscal year 1925 the Department issued 620 new publications, 258 numbers of nine periodicals, and 441 reprints, in total editions aggregating 23,825,546 copies, of which 11,790,535 were Farmers' Bulletins. The *Yearbook* for 1924, on the plan begun in 1921, contained articles on highways and highway transportation, farm credit, farm insurance and farm taxation, hay, the poultry industry, and weather and agriculture. An appendix of over 600 pages contained statistics of crops, livestock, forestry, imports and exports, farm wages, farm prices, farmers' business associations, etc.

**AIR, AIR CURRENTS.** See METEOROLOGY.

**AIRCRAFT CARRIER.** See VESSELS, NAVAL; NAVAL PROGRESS.

**AIRPLANE.** See AERONAUTICS.

**AIRSHIP.** See AERONAUTICS.

**ALABAMA.** POPULATION. According to the Fourteenth Census, the population of the State, on Jan. 1, 1920, was 2,348,174. The estimated population on July 1, 1925, was 2,467,190. The capital is Montgomery.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	2,900,000	36,250,000	\$44,225,000
	1925	2,797,000	37,760,000	\$7,760,000
Oats	1924	125,000	1,875,000	1,631,000
	1925	131,000	2,227,000	1,737,000
Rye	1924			
	1925			
Hay	1924	638,000	456,000 *	8,625,000
	1925	613,000	422,000 *	8,398,000
Potatoes	1924	28,000	2,520,000	3,906,000
	1925	25,000	1,425,000	3,135,000
Sweet potatoes	1924	60,000	4,380,000	5,475,000
	1925	65,000	4,550,000	5,688,000
Cotton	1924	3,114,000	985,600 *	111,762,000
	1925	3,581,000	1,335,000 *	126,152,000
Peanuts	1924	270,000	135,000,000 *	5,535,000
	1925	180,000	100,800,000 *	3,226,000

\* tons, <sup>b</sup> bales, \* estimate, <sup>a</sup> pounds.

**MINERAL PRODUCTIONS.** The leading mineral products of Alabama are coal and iron ore. The production of coal in 1923, was 20,457,649 tons, valued at \$51,624,000. The production in 1924 was 19,130,184 tons, valued at \$44,756,000. The iron ore produced in 1924 was 6,557,596 tons, valued at \$13,927,551, compared with 6,922,663 tons, valued at \$15,540,198 in 1923. Aside from the products derived directly from the mines, there were made, in 1924, 2,867,361 tons of pig iron, valued at \$55,791,228, compared with

2,784,625 tons, valued at \$64,912,809 in 1923. There were produced 4,654,075 tons of coke, valued at \$19,817,394 in 1923, compared with 3,799,865 tons, valued at \$14,708,245 in 1922. Other mineral products of importance are cement, graphite, sand and gravel, and stone. The total value of the mineral products in 1923 amounted to \$82,496,430, compared with \$61,723,268 in 1922. In these totals the coke and pig iron are not included.

**FINANCE.** According to the summary of the United States Department of Commerce, the payments for maintenance and operation of the general departments of the State for the fiscal year ending Sept. 30, 1924, amounted to \$13,934,767. Additional amounts expended for interest on debt and outlays for permanent improvements brought the total payments to \$22,835,397. The per capita payments for maintenance and operation amounted to \$5.71 in 1923, compared with \$5.32 in 1923, and \$3.05 in 1917. The largest single expenditure in 1923 was \$7,300,229 for the construction and maintenance of highways. The total revenue receipts of the State for 1924 amounted to \$19,358,454, which was \$4,505,339 more than the total payments excluding those for permanent improvements, but \$3,476,943 less than the total payments. The payments in excess of revenue were met from the proceeds of debt obligations. Of the total revenue in 1924, property and special taxes represented 37.6 per cent, or \$2.99 per capita, compared with \$2.84 in 1923, and \$1.94 in 1917. Aside from property and special taxes, the revenue is derived from the earnings of general departments and from business and non-business licenses.

The total net indebtedness of the State in Sept. 30, 1924, was \$20,178,450, or \$8.27 per capita, compared with \$6.97 in 1923, and \$5.80 in 1917. The assessed valuation of property in the State in 1924 amounted to \$997,156,701. The State taxes levied amounted to \$6,481,519, or \$2.66 per capita.

**TRANSPORTATION.** The total mileage of railway track at the end of 1924 was 5562. There were constructed, during 1925, 3.25 miles, all of first track.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$541,719,000, compared with \$302,809,000 in 1921, and \$492,732,895 in 1919. The average number of wage earners employed during 1923 was 109,520, compared with 82,748 in 1921, and 120,889 in 1919. The "lumber and timber products" industry is the leading one in the State, as measured by the number of wage earners, but measured by the total value of products, the manufacture of cotton goods is first in importance. This industry employed 20,325 wage earners in 1923 and the value of the product was \$86,383,000, compared with \$51,150,000 in 1921, and \$79,643,000 in 1919. The value of the "lumber and timber products" in 1923 amounted to \$52,792,121, compared with \$30,674,667 in 1921, and \$55,139,000 in 1919. The number of establishments whose output was \$5000 or more increased from 1855 in 1921 to 1993 in 1923.

**EDUCATION.** The chief features of the educational advancement during the year were continued efforts for professional improvement of

teachers in service, and the continuation of the publicity programme of the Alabama Education Association, which has for its object the interpretation of the schools to the people. This campaign has resulted in excellent results. There has also been a great improvement in the character and work of teachers in service, and the steady increase in the number of professionally trained teachers. About 60 per cent of the teachers in the State attended summer school in 1925. There was a gain of about 5 per cent in professionally trained teachers.

**CHARITIES AND CORRECTIONS.** The State Board of Administration is given general charge of the charitable and correctional institutions of the State, which include hospitals, hospitals for the insane, both white and colored, and many institutions in various cities devoted to child welfare. The prisoners of the State are employed under the convict lease system. As the legislature was not in session in 1925 no laws relating to charities and corrections were passed.

**POLITICAL AND OTHER EVENTS.** The legislature was not in session as its meetings are quadrennial, with a session to be held in 1927. There were no State-wide elections in 1925. Perhaps the most important political happening was the announcement made by Senator Underwood in July, that with the expiration of his term in the Senate, in 1926, he would not be a candidate for reelection. Senator Underwood was first elected to the House of Representatives in 1895 and thus has served in Congress for 32 years. In the House he was one of its most prominent members and in 1910 was leader of the majority and the chief formulator of the Underwood Tariff Bill. In 1914 he was elected to the Senate and within a short time had become one of the most prominent members of that body. In 1914 he was elected Democratic leader but on account of ill health was obliged to abandon this position in 1922. In that year he was one of the four American delegates to the Conference for the Limitation of Armaments. Senator Underwood was one of the prominent candidates for the presidential nomination at the Democratic National Convention in 1924.

During the year an important power development was begun which included the formation of a new lake from the waters of the Tallapoosa River. This was to be called Cherokee Bluffs Lake, and was to contain 530,000,000 gallons of water. Three electric generators, each driven by a 45,000 horse power water wheel turbine, were to provide power. This project, when completed, was to form the largest power unit in the South, surpassed only by Niagara Falls. On October 25, a severe tornado which swept over the southern States killed about twenty people and injured many more, in Alabama.

**OFFICERS.** Governor, William W. Brandon; Lieutenant-Governor, Charles McDowell; Secretary of State, Sidney H. Blan; Treasurer, George W. Ellis; Auditor, William B. Allgood; State Superintendent of Education, John W. Abercrombie; Attorney-General, Harwell G. Davis; Commissioner of Agriculture and Industry, J. M. Moore.

**JUDICIARY.** Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. D. Sayre, Ormond Somerville, Lucien Gardner, John M. Miller, and Virgil Boulden.

**ALABAMA, UNIVERSITY OF.** A State institution of higher learning at University, Alabama; founded in 1831. The enrollment for the fall term of 1925 embraced 2097 students distributed as follows: art and sciences, 1107; commerce, 415; engineering, 257; education, 82; medicine, 102; law, 134. For the 1925 summer session 1946 were enrolled. Two additional members in the faculty over the preceding year increased the number to 97. The productive funds of the institution amounted to \$1,511,513.15, and the income for the year totaled \$628,881.79. In 1925 a new library was erected at a cost of \$200,000, while another new building containing a supply store, Post Office, and cafeteria was completed at a cost of \$100,000. Gifts to the amount of \$120,000 were received by the University during the year. The library contained 55,000 bound volumes, and 3500 pamphlets. President, George H. Denny, Ph.D., LL.D.

**ALASKA.** During 1925 the Federal Government continued its efforts to increase the efficiency of its Alaskan officials. Every Federal department was represented by an official stationed in the Territory fully clothed with power to act. The new Governor was an Alaskan of long residence and extended experience. Materially there were advances and recessions. Territorial expenditures were well within receipts. Financial institutions were strengthened. The output of gold lodes largely increased. The seal herd increased in numbers, and the conservation of wild life ensured by regulations under the Game Law of 1925. The Federal control of fisheries had been judiciously initiated, and the output was a catch larger than that of 1924. Discouraging items were the reduced products of placers, the nonsuccess of coal mining, the failure of oil development, and the continued deficit in the operation of the Alaska Railroad.

Secretary Work, Department of the Interior, reported: "Alaska is rapidly becoming a *lost province*. The whites have shrunken to 20,000, estimated, and production from its natural resources wavers and recedes. The situation calls for a prompt sympathetic study by Congress. The suggestion that Government's activities be merged into one department should have immediate consideration of Congress."

**TERRITORIAL.** The governor recommended urgently changes in Federal laws: To facilitate acquirement of land by natives, whites and industrial establishments; to lease lands for grazing and fur-bearing industries; to replace eight organizations by a constabulary; allotment from seal profits to aid education; lease of public lands for grazing and fur-bearing industry; medical plant for relief of natives in Yukon watershed.

**FISHERIES.** This is the dominant Alaskan industry which in 1924 with an investment of \$62,661,000 had 25,194 employees. Under the law of June 6, 1924, fisheries must be conducted under regulations of the Secretary of the Interior, which after experiences of 1924 were modified December 2, for enforcement in 1925. Omitting the fur seal the fisheries had considerably exceeded \$600,000,000; their conservation in 1925 seemed assured. About 80 per cent come from salmon and 6 from herring. The data of the salmon catch for recent years are (canned only): 1920, \$25,602,800, 4,429,463 cases; 1921, 2,596,826, \$19,632,744; 1922, 4,501,-

652, \$29,787,193; 1923, 5,035,097. \$32,873,007; 1924, \$33,007,135; 1925 (estimated), 4,456,391, \$30,000,000. Of the entire fishery products of 1924, value \$40,289,273, 80 per cent were from salmon. The minor salmon output,—salted, pickled, etc.—increased from \$1,365,756 in 1923, to \$1,786,369, in 1924. The catch of salmon in 1924 increased 161 per cent in the central waters, and fell off respectively in the southeastern and western waters, 18 and 32 per cent. Although the catch of 1925 had fallen over 15 per cent from that of 1924, it was considerably above the average. The decrease this year was due to the serious failure in Bristol Bay, attributed to over-fishing and to interception of breeding salmon.

**MINOR FISHERIES.** Of these herring is of the greatest importance, increasing in value from \$1,602,571 in 1923 to \$2,458,370 in 1924. Larger amounts were expected in coming years, as the use of herring for fertilizers had become restricted. The halibut catch of 1924 amounted to 15,038,000 pounds, valued at \$1,619,443. The conservation of this valuable species, which was being over-fished, was ensured by the treaty of Mar. 24, 1924, between Great Britain and the United States, under which a closed season is enforced between November 16 and the subsequent February 15. Cod were caught to the amount of 1,580,000 pounds, valued at \$100,777. The so-called unimportant fish have largely developed, the value of crabs rising to \$629,412, and shrimp to \$227,979; altogether the value for 1924 approximated \$1,000,000. Whaling in late years has been stationary, \$391,781, in 1924, but is said to have been much more productive in 1925.

**FUR-SEALS.** Under the convention with other powers in 1911, the conservation of the herds of fur-seals of the Pribilof Islands proceeds steadily. Improved methods of handling this Federal industry were introduced by the U. S. Bureau of Fisheries. A breeding reserve of 8572 three-year-old bull seals was set aside: at present the only seals killed are males. There were taken in 1924, 17,219 sealskins, and 19,860 in 1925. The following censuses show a steady increase in the herd: 1922, 604,692; 1923, 653,008; 1924, 697,158; 1925, 723,050. Recent sales of seal-skins are, Oct. 15, 1924, 17,000 skins for \$470,447; May 25, 1925, 8025 skins for \$225,994; and 362 for \$16,835.

**LAND ANIMALS AND CONSERVATION.** Under the Alaska Game Law of Jan. 13, 1925, the Secretary of Agriculture issued regulations for conserving wild life, through the *Biological Survey*. Its field work is controlled by the Alaska Game Commission, four Alaskans and one resident official. Their duties also aid fur-farming, grazing methods, game and bird refuges. The territorial Legislature appropriated \$10,000 for stocking proper places with wild animals. The fur production was increasing, its value—excluding the Pribilof foxes—approximating \$2,000,000. Outward shipments were 284,115 pelts, worth \$1,625,201. Foxes, five varieties, lead in value, followed by the mink. The most productive species were: 39,356 mink, \$334,526; 13,353 red fox, \$267,060; 5728 white fox, \$229,120; 194,053 muskrat, \$194,053; 6019 marten, \$150,475; 1640 blue fox, \$131,200; and 5713 beaver, \$114,260. Average individual values were: silver gray fox, \$125; blue fox, \$80, and white fox, \$40.

**FOX FARMING.** This industry was pursued on more than 300 farms thus distributed: south-eastern districts more than 200; coast Gulf of Alaska, nearly 40; vicinity Seward Peninsula, 33; Aleutian Islands, 80. Many permits for capture of animals were granted for propagation. Experiments were made for raising other species. The most important farming was by the Bureau of Fisheries on the Pribilof Islands, where improved methods of feeding and care were followed. During the season 1923-4 there were taken 787 blue and 15 white pelts, which were sold for \$50,386. The catch for 1924-5 was 681 blue and 28 white foxes.

**REINDEER.** Surveys in 1925 estimated that in the 110 great herds there were about 350,000 deer. They occupied ranges northward from the Yukon valley along the seacoasts to Point Barrow, with small herds on several of the islands of Bering Sea and the Aleutian group. Improved methods were introduced for range handling, elimination of the unfit, breeding, branding and castration. Problems of slaughter and marketing were in abeyance. The transfer of the Reindeer Experimental Station to Fairbanks for cooperative research with the Alaska Agricultural College promised advances in cross breeding, winter feeding and improvement. The reindeer were valued at \$9,850,000. Fortunately two-thirds of them are owned by the Eskimo.

**NATIVES.** Despite the unchristianlike neglect by the General Government, the natives, though denied the advantages of citizenship, are slowly emerging from the wretchedness of primitive life. The reindeer Eskimo of the north, and the natives living near canneries in the south were able to live comfortably; others drag out a miserable existence.

As to existing conditions the Secretary of the Interior reported: "Our guardianship of the Alaskan natives has been lax. . . . A most destructive disease was communicated to them by the whites, imposing a national obligation which our government cannot justly ignore. . . . They are wards of the Government and entitled to protection." Startling are the conditions reported as to the 4000 natives distributed along 1000 miles of the Yukon River, for whom there is one antiquated hospital with seven beds. Congress appropriates less than five dollars a head for medical care and relief of destitution: \$124,000 for 26,000 natives.

The Alaska Division of the Bureau of Education, to whose praiseworthy and practical labors are due the uplift of thousands, is charged with the education, industrial training, medical care, relief of destitute, sanitation, and supervision of the reindeer industry. Granted \$402,000 for education, less than \$5 per head, its 157 teachers in 104 schoolrooms, gave instruction to an enrollment of 3912 pupils, whose average attendance was 2362, varying from 62.2 per cent in the southeast to 78.6 in the southwest district. The unwise policy of teaching natives in the States has been most advantageously replaced by the establishment of four industrial schools with 200 pupils, teaching them for practical livelihood. Boys learn carpentry, electrical and steam appliances used in navigation, machinery, etc. Girls are trained in home-fitting, domestic duties, nursing, sanitation, tanning, weaving, etc.

Medically, treatment was given in 23,062 cases, of which 11,524 were in the diphtheria

epidemic on Seward Peninsula, and the influenza at Bristol Bay—diseases introduced from the States—affecting 4112 natives. Thousands of sick and destitute individuals were treated, in clinics, homes and hospitals. Five hospitals were maintained, at Akiak, Kanakanak, Juneau, Noorvik, and Nulato. At the orphanages at Eklutna and Kanakanak 143 homeless children were cared for. Efforts were made to reorganize the reindeer industry on a cooperative basis as to breeding, range training and marketing. As a result the amount of reindeer meat shipped from Alaska increased from 195,829 pounds in 1924 to 294,354 pounds in 1925.

**FORESTS.** The national forests of Chugach and Tongas, aggregating 21,000,000 acres in area, were successfully managed, and furnished more than four-fifths of the lumber used in the Territory. Some high grade spruce was exported. The receipts for stumpage—\$106,342 in 1925 for 55,000,000 board feet—exceeded the cost of administration and protection. Preparation for sales of pulp wood was made by the selection of sites of 464,000 horse power for use by investors when they enter the field. The permanent annual capacity of pulp wood is estimated at 2,000,000 cords. Within the forests there were constructed 145 miles of roads, and 226 of trails.

**FINANCES AND TRADE.** The total territorial receipts for 1924 were \$976,753, with expenditures of \$858,550, leaving in the treasury on Jan. 1, 1925, \$267,114. The amount of the Alaska Fund increased from \$196,105 in 1924, to \$220,978 in 1925. This Fund, receipts from Federal taxes, is spent as follows: 65 per cent for roads and 25 for schools, outside of incorporated towns, and 10 for aid to white indigents. Of the 18 incorporated towns, the assessed valuation in 16 was \$21,283,128, with tax levies from 10 to 20 mills. The banking examinations on June 30, 1925, reported capital \$830,000; surplus, etc., \$445,000; deposits \$10,097,000, an increase of \$1,723,000 over those of 1924. As indicated by cable tolls and inward shipments, the trade of Alaska was improving. The cable tolls for 1925 were \$408,837. Inward shipments were valued as follows: 1923, \$29,981,604; 1924, \$31,719,251; 1925, \$33,621,969. Outward shipments include small amounts of forestal products of wool and of reindeer meat, with the usual fish, furs and minerals.

**AGRICULTURE AND PUBLIC LANDS.** Experimental agricultural stations were maintained and were developing types of grain, forage and stock suitable to the country. An important private enterprise was the introduction of sheep on the Aleutian Islands, following the successful flock of 2000 on Unalaska Island in 1924. The impracticable provision of the Homestead Law, requiring rectangular surveys, often made it impossible for homesteaders to acquire desirable agricultural land. By crossing cattle, already successful on the islands, it was thought that beef stock might be made profitable in the interior valleys.

**COMMUNICATIONS.** The cable, radio and wireless systems of the Army and Navy had been so largely supplemented by private installations that practically all of Alaska in 1925 was in touch with the outside world, except the western isles of the Aleutian group. The cable system, whose connections extend to Nome, was en-

larged in 1925. This system, "one of the most notable achievements of the Signal Corps," says the Secretary of the Interior, had receipts of \$409,000 in 1925, against \$27,000 the first year.

**ROADS.** Three separate bureaus complicate conditions. The Alaska Road Commission has largely devoted its work to rehabilitation of roads and trails in remote regions. Their work was aided by a Territorial Commission. The Agricultural Bureau of Public Roads maintained 170 miles, in and around the national forests, at a cost of \$416,000.

**TERRITORIAL SCHOOLS.** The 17 incorporated towns maintained schools, with an enrollment of 2822, at a per capita cost of \$107. In 56 districts outside of incorporated towns there was an enrollment of 1289, costing \$118 per head. Nine towns had high schools, the graduates of seven being accredited at the University of Washington. The Agricultural College and School of Mines had a total enrollment of 133. To relieve the heavy educational burden, the Governor recommends the allotment of part of the revenue from seals for the maintenance of the public schools.

**FEDERAL ACTIVITIES.** Besides work elsewhere recited, the Geodetic Survey made navigation safer, and so reduced marine insurance. Army Engineers improved harbor and river facilities. The Lighthouse Board added 60 new aids to navigation in 1925. The Bureau of Fisheries materially added to the comfort and prosperity of the Pribilof natives. The Geological Survey mapped topographically 21,900 square miles, and geologically surveyed 23,080 square miles. It also continued its investigations of the Naval Petroleum Reserve, No. 4 in northern Alaska, and explored and mapped 7000 square miles of unexplored areas on the arctic littoral.

**RAILROADS.** The condition of roads managed by commercial corporations remained unchanged. The Government system, the Alaska Railroad in its yet uncompleted state, was a problem of serious importance. While the policy of its construction may be questioned, the Secretary of the Interior reported: "To abandon it would amount to a reversion of the American policy of progress." Under hurried construction many structures were temporary, glacial streams poorly bridged, and much track unsubstantial. The costly upkeep was largely augmented by the enforced addition of river transportation on the Yukon and Tanana, to replace the commercial systems necessarily discontinued owing to the opening of the Alaska Railroad. By rigid economy and the elimination of unprofitable activities the deficit of operation in excess of revenue—which amounted to nearly \$2,000,000 in 1924—was reduced to \$1,575,139 in 1925. Service was reduced to meet conditions. Two passenger trains run in a week in each direction, increased to three in summer, while the freight trains run as extras when needed. During the summer season the steamers run on schedule between Nenana on the Tanana and Holy Cross on the lower Yukon, there connecting with a commercial service; they carried 3125 tons of freight and 833 passengers in 1925. To complete the railroad, to furnish equipment and facilities for efficient and economical operation, an appropriation of \$11,878,781 was asked from Congress.

While there is but one hospital of seven beds for 6000 persons in the Yukon valley the budget

for medical care of natives for 1927 is reduced \$27,680.

**CONGRESSIONAL LEGISLATION.** Besides the regular appropriations, there were enacted laws authorizing Sitka to issue bonds for school-building of \$25,000; Juneau for sewerage system, \$60,000; and authority given for the Secretary of the Interior to open industrial schools for the natives.

**MINERALS.** The Alaskan mines produced in 1925 minerals to the value of \$17,850,000, as against \$17,457,333 in 1924. The output since 1880 approximated \$553,000,000. The values for 1924, followed by those of 1925, were as follows: Gold, \$6,285,724 and \$6,150,000; copper, \$9,703,721; silver, \$448,659 and \$475,000; coal, \$559,580; lead, petroleum, tin, etc., \$459,249 and \$500,000.

There was a material increase in the output of gold lodes, and a decrease of placer values. The more productive lodes were those of the Alaska-Juneau Co., the Mohawk and Crites-Feldman in the Fairbanks district, and on Chicagof Island. The placer output of 24 dredges was about \$1,470,000, being \$100,000 less than in 1924. Improved machinery, etc., was expected to produce an increased amount in 1926. During 1925 there were increases in the Yentna, Circle, Tolovana and Koyukuk districts, the Yukon-Tanana region, and Fairhaven district.

In 1925 as in other years, copper came largely from Kennecott, Mother Lode and Green Butte mines of the Copper River region, and the Beatson mine, Latouche Island. The higher price of copper accounts for the increased value of the year. An amount of palladium, of the platinum group, came from the copper of the Alaska Palladium Co., Prince of Wales Island. While the larger amount of silver came from the copper ores, active work in developing silver lodes was prosecuted in the Kantishna, Hyder, Skagway and Wrangell districts.

Exploration for petroleum was continued on the Alaska Peninsula, where drillings to depths of 3000 to 5000 feet have tapped no commercial deposits. The wells of the Chilkat Oil Co., near Katalla, produce all the Alaskan petroleum. The examination of Naval Petroleum Reserve No. 4, was continued by the U. S. Geological Survey without developing new seepages.

**OTHER MINERALS.** Garnet, gypsum, lead, marble, platinum, quicksilver and tin were produced. The deposits and facilities for mining these minerals were such that practically any amount of them could be produced, except tin and platinum.

**ALBANIA**, *al-bā'nī-ā*. A geographical district in the Balkans consisting of the former Turkish provinces of Scutari and Yanina and parts of the Turkish vilayets of Monastir and Kassova. In 1922 an international commission partially determined the boundaries. The probable area of the country is estimated at about 17,347 square miles; the population estimated at 831,877, of whom 584,675 were Mohammedan, 158,215 Greek Catholic, and 88,987 Roman Catholic. It is divided into eight provinces named after the chief towns. The latter, with their estimated populations are as follows: Tirana, the provisional capital, 12,000; Scutari, 32,000; Korytza, 24,000; Elbasan, 13,000; Argyro Castro, 12,000; Berat, 8500; Valona, 6500; and Durazzo, 5000. The principal race groups are the Ghegs in the north and the Josks

in the south. According to the latest available statistics, there were 549 primary schools with 854 teachers and about 24,000 pupils. Albanian students were being supported at government expense while pursuing their education in Italy, Austria, and France.

Agriculture is primitive, and large tracts of land remain uncultivated. The chief products are: Tobacco, wool, olive oil, corn, and cattle. The mineral wealth is said to be considerable, though it has not been developed, and there are valuable forests. A coarse native cloth is manufactured from wool but for the most part such manufactures as exist in the country pertain to the working up of agricultural products. Practically the only country with which Albania trades is Italy. In 1923 Albania imported sugar to the value of 1,564,741 gold francs; coffee, 784,352 francs; rice, 630,083 francs; cotton goods, 1,380,930 francs. She also imported skins, petroleum, and woolen goods. In 1923 the estimated revenue and expenditure balanced at 21,664,078 gold francs. There are no railroads in the country and only 310 miles of improved roads.

Albania was proclaimed an independent country by the general in charge of the Italian forces, June 3, 1917, and a provisional government was set up at Durazzo. Since then several cabinets have been in power, the latest being that of Ahmed Zogu, Jan. 10, 1925. The diet, consisting of 99 members, was elected in January, 1924. The chief authority is the council of regents consisting of a representative of each of the religious bodies. On Dec. 17, 1920, Albania was admitted to the League of Nations.

**HISTORY.** As noted in the previous YEAR Book, the month of December, 1924, witnessed another revolution in Albania. Ahmed Zogu, who had been thrust from power by Bishop Fan S. Noli, reorganized his forces in Jugo-Slavia and made a triumphant reëntrance into the country, overthrew Noli, and by the opening of 1925 had firmly established himself as the ruler of the country. Noli was compelled to flee to Italy, which country would have been glad to support him in his struggle with Ahmed had it not been for the strong protests on the part of Great Britain and France, protests which were all the stronger because of the presence of fleets in the Adriatic. On Jan. 15, 1925, the Constituent Assembly met and immediately attacked the problem of forming a new ministry. Zogu was asked to form a ministry and the result of his efforts was as follows: Prime Minister, Minister of Foreign Affairs, and Minister of the Interior, Ahmed Zogu; Minister of Justice and Finance, Mufid Libohova; Minister of Education and Public Works, Constantine Kotta. The position of Minister of War was abolished. On the 19th this cabinet received an unanimous vote of confidence from the Assembly and on the 22nd proclaimed Albania a republic, and elected Ahmed to the position of president.

Among the more important provisions of the new constitution adopted may be mentioned the following: ministers need not be members of parliament, but had the right to speak in either house and were compelled to answer questions propounded by the Chamber of Deputies; within five days of its selection the cabinet must have received a vote of confidence from the chamber; the president was to appoint six members of the Senate as well as the presiding officer of

that body; bills might originate in either house or by the executive; to prevent the legislature from controlling the executive by means of the purse strings a provision was inserted that if the annual budget was not enacted before the beginning of the fiscal year the budget of the previous year was to be applied until the new budget law was passed; the president was given unlimited veto power; all officers and judges were appointed by the president; only the president and ministers could suggest constitutional changes; the provision creating the republic was placed beyond the amendment power; foreigners could not own rural land; and subsoil products with the exception of stone were the property of the state.

In the early months of the year there was considerable discussion in the press concerning the oil rights of Albania. It arose over the reported promise of Ahmed to give the Anglo-Persian Oil Company exclusive rights of exploitation. Secretary of State Hughes notified the Albanian government that the open door policy in respect to oil was a *sine qua non* of American recognition. The Italian government also protested against Zogu's policy but the British concern seemed too firmly entrenched with the Zogu government to be dislodged by diplomatic protests, although it was announced in March that Italy was to be permitted to bore for oil in any territory relinquished by the Anglo-Persian Company. By the summer a satisfactory arrangement had been reached concerning the exploitation of the fields and certain spheres had been assigned to various countries. This resulted in the recognition of the country by the United States and on August 1, Charles G. Hart presented his credentials to the Albanian government as Minister from the United States.

On August 6 the Council of Ambassadors announced that Sveti Naum was awarded to Jugo-Slavia in exchange for Piskopjeva. This decision settled a dispute between Albania and Jugo-Slavia concerning the delimitation of the boundary between the two countries. They had been unable to reach a diplomatic agreement and then decided to refer the matter to the council. The followers of Noli, who were strongly represented in the neighboring countries, protested against this decision.

As the year drew to a close the position of Ahmed was anything but secure. In the last week of November a crisis occurred which resulted in the resignation of the 20 elected senators and left the control of legislation in the upper house in the hands of the six senators appointed by the president. The country was completely demoralized and lawlessness was rife. Ahmed appeared to be losing his popularity and Noli and his followers were gathered on the frontiers awaiting an opportunity to regain power through a *coup d'état*. Zogu attempted to prolong his power by resorting freely to the use of exile against his strongest opponents.

**ALBERTA**, al-bûr'tă. A northwestern province of Canada, formerly consisting of a large part of the Northwest Territories; bounded on the east by Saskatchewan, on the west by British Columbia, and on the south by the United States. Area, 255,285 square miles; population (1921), 588,454, as compared with 496,525 in 1916. The rural population in 1921 numbered 365,550, and the Indian, 8745. Chief towns with their 1921 populations: Calgary, 63,305; Edmonton, 58,821; Lethbridge, 11,097; and Medicine Hat,

9634. The movement of population in 1923 was as follows: Births, 15,153; deaths, 4843; marriages, 4417.

Agriculture is the chief occupation but there are valuable deposits of coal, natural gas and petroleum. Besides the raising of grain, livestock and dairying are the chief industries. Out of a total arable acreage of 82,810,000, about 12,000,000 were under cultivation in 1925. In 1924 the wheat yield was 68,691,000 bushels; oats, 65,851,000 bushels; and barley, 10,796,000 bushels.

It has been reported that Alberta contains 17 per cent of the coal reserve of the world. In 1923 the output was 6,866,923 tons. In the same year the natural gas output was valued at \$1,700,000. The total mineral production of 1923 was valued at \$31,646,816. Executive power is nominally vested in a lieutenant-governor appointed by the Federal government, but it is actually vested in an executive council or cabinet. Legislative power is in the assembly which is elected by direct vote including woman's suffrage. Lieutenant-governor at the beginning of 1925, R. G. Brett; prime minister, Herbert Greenfield. At that time there were 60 members in the Assembly including 40 United Farmers; 12 Liberals; 4 Laborites; 2 Independents; 1 Conservative; and 1 Independent Farmer. The Legislature included two women members. See CANADA.

**ALCOHOL.** See CHEMISTRY, INDUSTRIAL.

**ALEXANDRA**, CAROLINE MARIE CHARLOTTE LOUISE JULIE Green, mother and widow of King Edward VII of England. Born at Sandringham Hall, Norfolk, November 20. Princess Alexandra was born Dec. 1, 1844, at Copenhagen. She was the eldest daughter of Prince Christian of Glucksburg, of the house of Schleswig-Holstein, later King Christian IX of Denmark, and Princess Louise of Hessen-Nassau. After the death of Frederick VII of Denmark without an heir, Prince Christian was made king by popular election and his children were raised to the rank of the Danish royal family. The two princes and three princesses made notable marriages, uniting the thrones of England, Russia and Greece by family ties. When 17 years of age Princess Alexandra, who had previously visited in England, met in the Rhenish Cathedral of Speyer Albert Edward, the Prince of Wales, who was then about 19 years of age. The attachment of the young couple received the approval of their parents and their wedding took place on Mar. 10, 1863, in St. George's Chapel, Windsor, amid great enthusiasm on the part of the British people. The new Princess of Wales carried into her life in England the simplicity of her earlier days and after her wedding and the honeymoon spent at Osborne, in the Isle of Wight, took up her life at Sandringham Hall in Norfolk, a place purchased by Queen Victoria, and presented to the young couple. Marlborough House, in Pall Mall was the city home of the Prince and Princess of Wales. In her country home, she soon made herself beloved of the people by many acts of kindness and attention to those in misfortune. The first offspring of the marriage was Albert Victor, Duke of Clarence, born in 1864, who died at the age of 28 in 1892. Prince George, who succeeded his father, Edward VII May 6, 1910, was born June 3, 1865. The other children of the Princess of Wales were Alexander John Charles Albert, who died the day after his birth; Louise Victoria Alexandra

Dagmar, later Duchess of Fife and Princess Royal; Victoria Alexandra, unmarried; and Maud Charlotte Mary Victoria, who married her cousin Prince Christian Frederick of Denmark, later King Haakon VII of Norway. As Princess of Wales it was inevitable that for many years Alexandra should occupy a subordinate position at the Royal Court, but with the failure of the health of Queen Victoria it became necessary for her to take a more prominent part and to carry on an increasing number of social tasks. When her husband, Albert Edward, ascended the throne Jan. 22, 1901, she was well qualified to exercise the various functions of a queen. She received a number of honors and prerogatives never before enjoyed by the consort of a British monarch. She maintained interest in benevolent enterprises and in music. She reigned until the death of King Edward VII, May 6, 1910, and later for a while entertained on the scale to which she had been used, but afterward withdrew into retirement at Sandringham. She was beloved by all classes of people and her death called forth many expressions of grief. After a funeral service at Sandringham she was interred in the Chapel of Windsor Castle near her husband, King Edward VII and Prince Albert Victor, Duke of Clarence, their eldest son.

**ALFALFA.** Estimates published by the U. S. Department of Agriculture Dec. 22, 1925, placed the area in alfalfa in the United States for the year at 11,040,000 acres, and the yield of hay at 28,858,000 tons, the average yield per acre being 2.61 tons. All these figures represented increases over the preceding year. California led in yield with 4,078,000 tons and in average yield per acre with 4.20 tons, while Nebraska, ranking first in area with 1,300,000 acres, stood second with a yield of 3,016,000 tons, the average yield per acre being 2.32 tons. Idaho, Kansas, Colorado, Utah, Montana, and South Dakota, given in decreasing order of production, ranged from 2,694,000 tons to 1,078,000 tons in yield. The marketable surplus of alfalfa hay in 1925, in the surplus-producing States, was below that of the preceding year, although the reduction in Nebraska, Missouri, Colorado, and New Mexico was offset to a considerable extent by increases in the marketable supply in California, Utah, Idaho, and Wyoming.

Nebraska, a leading alfalfa State in which alfalfa hay constitutes over half of all the hay produced, suffered the largest reduction, the year's surplus being only 65 per cent of the 1924 surplus. The movement of alfalfa hay, interstate and otherwise, was about the same as in the preceding year, both as to percentage of marketable surplus and time of marketing. During the year, however, the Missouri State Plant Board declared an embargo against alfalfa hay from Utah, Wyoming, and parts of Idaho, Colorado, Nevada, California and Oregon, to prevent the introduction into the State of the alfalfa weevil occurring in those regions. Only 4,782,500 pounds of alfalfa seed were imported during the year ended June 30, 1925, as compared with 12,818,400 pounds in the preceding year. About one-half the quantity imported in the fiscal year 1925 came from Canada and Argentina, the former country leading with 1,690,000 pounds while France, South Africa, and Italy, mentioned in the decreasing order of imports, supplied most of the rest. Preliminary field tests in the eastern United States, made by the Department of

Agriculture, seemed to indicate that alfalfa seed from Argentina lacks in hardiness north of central Pennsylvania, while seed from South Africa, apparently, is not particularly well suited to any part of this country. For the study of the chalcis fly and the better control of this pest inimical to alfalfa seed production, the State Legislature of Utah appropriated \$3000. A root rot of alfalfa was reported from Colorado the past year. This disease seems to cause a wilting in spring of the shoots of plants three or more years old, which finally die and are not replaced. United States standards for alfalfa hay and alfalfa mixed hay became effective July 1, 1925, and were later promulgated as official for the country.

**ALGERIA.** A French colony forming politically a part of France itself, situated in northern Africa. It comprises the two great divisions of Northern and Southern Algeria which in turn are subdivided as follows: Northern Algeria into the departments of Algiers, Oran, and Constantine; Southern Algeria into the territories of Ain Sefia, Ghardaia, Tougourt, and the Oases of the Sahara. Total area estimated at 222,180 square miles; population, including military forces, February, 1922, 3,802,464, of whom all but 546,044 were in Northern Algeria. The Europeans numbered 831,040. All but a small fraction of the population was in the towns and cities. Chief towns, with their populations for 1921: Algiers, 206,595; Oran, 141,156; Constantine, 78,220 (these three being respectively the capitals of the provinces of the same name); Bone, 45,171; Tlemcen, 43,090; Sidi-bel-Abbes, 37,752; Blida, 36,384; Tizi Ouzou, 35,171; Philippeville, 38,808; and Sétif, 30,867.

The chief race groups in the native population are Arabs, Berbers, and Kabyles, and the prevailing religion is Mohammedanism. The chief Christian church is the Roman Catholic which maintains an archbishop and two bishops. For higher education there is a university at Algiers with an attendance in 1923 of 1532 students, and there are special schools of commerce, hydrography, agriculture, and the fine arts. There are also higher Muslim schools at Algiers, Constantine, and Tlemcen. Primary and infant schools in 1923 numbered 1485 (public and private), with 106,106 pupils.

**PRODUCTION.** The landholders fall into three classes, proprietors, farmers, and métayers. The cereal crops are of chief economic importance, especially wheat, barley, and oats. The yield of these three crops in 1924 was estimated 17,355,000 bushels of wheat, 21,842,000 bushels of barley, 7,653,000 bushels of oats. Other crops are corn, potatoes, artichokes, beans, peas, and tomatoes, and there is a considerable cultivation of flax, silk, and tobacco. (See table of production by countries under AGRICULTURE.) Next in importance to the manufacture of flour, semolina, macaroni, and allied food products, is the wine crop, which in 1924 yielded 215,318.488 gallons from an area of 471,340 acres. There is a considerable manufacture of alcohol and other distilled spirits. In 1923 there were 8000 tobacco planters, who raised 20,612 tons of this product.

**COMMERCE.** The figures for the foreign trade of the colony in thousands of francs in 1924 were as follows: Imports, 2,793,744; exports, 1,990,494. France had by far the greatest share of both exports and imports. The larger part of the imports consisted of manufactured articles

and of the exports of animal and vegetable products. In 1924 the chief imports were sugar, petroleum, paper, clothing, and automobiles, and the chief exports were sheep, raw silk, eggs, wheat, tobacco, cigarettes, and wines.

**FINANCE.** Budget estimates for 1925 were: Revenue, 386,420,804 francs; expenditure, 386,309,835 francs; in each case a surplus of from the estimates of the preceding year. The chief sources of revenue in the 1924 budget were taxes of various kinds, stamp duties and other duties, posts, telegraphs, and telephones. The chief item of expenditure was the service of the public debt.

**COMMUNICATIONS.** In 1924, 3848 vessels of 5,851,098 tons entered Algerian ports, and 4545 vessels of 6,894,031 tons cleared. The corresponding figures for the preceding year were 3839 vessels of 5,404,293 tons, and 4842 of 6,439,440 tons. The merchant marine of Algeria consisted in 1923 of 467 vessels of 70,982 tons. The railway mileage opened for traffic in 1923 was 2480 miles.

**GOVERNMENT.** The central executive authority of the local government is the governor-general who directs all the services with the exception of the non-Moslem departments of public instruction, justice, worship, and the treasury, which are each under a separate minister. The governor-general, with the minister of the interior, prepares the budget which is voted by the so-called Financial Delegations and by the Special Council. (For details in respect to the governmental machinery, see preceding YEAR BOOKS.) The colony sends to the home parliament one senator and two deputies for each department. Governor-general at the beginning of 1925, Théodore Steeg (appointed July 29, 1921).

**ALLEGHENY COLLEGE.** An institution of the higher learning at Meadville, Pa.; non-sectarian in policy but under the control of the Methodist Episcopal Church; founded in 1815. The enrollment for the fall of 1925 was 587, distributed as follows: graduate students, 3; seniors, 107; juniors, 141; sophomores, 153; freshmen, 183. For the 1925 summer session the registration was 118. The faculty numbered 38. The productive funds of the institution amounted to \$1,400,000, and the income for the year was \$229,747. The library contained 55,000 volumes. During the year Bentley Hall, the original administration building, was restored to its colonial architecture, through the generosity of John B. Ford of Detroit. Acting President, C. F. Ross. A.M., Litt.D.

**ALLEN, JAMES LANE.** American author, died February 18. He was born near Lexington, Kentucky, in 1849 and graduated at Transylvania University. He became a teacher in the public and private schools of his native State and later at Kentucky University, and was afterward Professor of Latin and higher English in Bethany College, West Virginia. He worked in the field of education until 1886, when he devoted himself entirely to literature. During his teaching days he found time for writing, and so gradually achieved success. He took up his residence in New York in 1886, and soon became recognized as a novelist and writer of short stories of artistic merit and interest. The scenes were laid in his native Kentucky and he was able to introduce not only the atmosphere of the region, but also a study of social types and conditions. His work ranged from the pioneer or ante bellum days down to more modern times,

and he had a sympathetic knowledge of humanity that appears in his work in attractive form. His most noted novels perhaps are *The Kentucky Cardinal*, published in 1895, and *The Choir Invisible*, published in 1899, but in addition he wrote *Flute and Violin* (1891), *The Blue Grass Region and Other Sketches of Kentucky* (1892), *John Gray—A Novel* (1893), *Aftermath* (1896), *A Summer in Arcady* (1896), *The Reign of Law* (1900), *The Mettle of the Pasture* (1903), *The Bride of the Mistletoe* (1909), *The Doctor's Christmas Eve* (1910), *The Heroine in Bronze* (1912), *The Last Christmas Tree* (1914), *Sword of Youth* (1915), *The Cathedral Singer* (1916), *Kentucky Warbler* (1918), *Emblems of Fidelity* (1919), and *The Alabaster Box* (1923).

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'.** This is an association of clubs, societies and groups formed for the purpose of encouraging and furthering in the United States and Canada the study and cultivation of the language, literature, art, and history of France. It was established in 1902, and by 1925 it comprised over 225 local branches: including French Alliances, affiliated societies and French clubs organized in universities, colleges, and schools. Ten groups were added to the Federation during the year, as follows: Alliance Française of Houston, Texas; Alliance Française of Muscle Shoals, Ala.; Alliance Française of Plainfield, N. J.; Société Française of Barnard College, New York City; Cercle Français of Kansas State Teachers' College Emporia, Kan.; Cercle Français of the Ogontz School, Pa.; Cercle Français of Oxford College, Oxford, O.; Cercle Français of Sullins College, Bristol, Va.; Cercle Français of the University of Texas, Austin, Texas; French Club of Technical High School, Providence, R. I. The Alliance Française brings from France each year, as official lecturers, one or more eminent men of letters who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers, and for the French Americans who live in America. It assists in organizing courses in the French language and literature in cooperation with the leading universities and encourages its groups to engage in dramatic performances and debates in French. The official lecturer from France in 1925 was M. Louis Réau, professor at the Ecole du Louvre. The Federation also organized short lecture tours for M. Emile Villamin, M. Paul Laumonier, exchange professor at Columbia University, Madame Marie de Mare Stein, and Madame Henry Caro-Delvaile. In 1925 the French Academy awarded its most important prize (Le Grand Prix de la langue française) to the Federation. This prize was to form the nucleus of the special fund which would enable the Federation to enlarge the scope of its activities. The aim of the organization was to collect \$100,000, of which the income only was to be used. The Assemblée Générale of the Fédération was held at the Hotel Plaza, New York City, on Apr. 18, 1925, and was attended by representatives of the various groups in the United States and Canada. The official organ of the Federation is *l'Echo de la Fédération*, and in addition its *Bulletin Officiel* is issued annually. Headquarters are at 32 Nassau Street, New York City. Officers in 1925 were: M. Frank D. Pavey, President; M. William Nelson Cromwell, General Vice-President; M. Albert Blum, President of the Executive

Committee; M. Maurice Mercadier, Treasurer; M. Félix Weill, General Secretary.

**ALLOYS.** See CHEMISTRY.

**ALSACE-LORRAINE**, al'zäs'lor'rân'. The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5605 square miles, total population in 1921, 1,709,749. The area and population are distributed among the three departments as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles, and 651,686 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles, and 468,943 inhabitants; Moselle (formerly Lorraine) 2403 square miles, and 589,120 inhabitants. The chief products are grains, vegetables, hops, wines, and above all minerals. When Alsace-Lorraine were under German rule, it was possible to get statistics on them separate from the rest of Germany, because they were in the nature of territories or conquered provinces. Now that they have become departments of France no separate figures are published on grain production, minerals, etc. For a general account, see FRANCE.

**ALUMINUM.** The aluminum industry in 1925 figured in Congressional discussions on the ground that The Aluminum Company of America, the largest producer, was a monopoly. It was charged that Andrew W. Mellon, Secretary of the Treasury, along with his family and commercial associates, controlled the corporation, and that it was receiving favor from the Government. Charges of violating a court order of 1912 were sent by the Federal Trade Commission to the Department of Justice in October, 1924, and in January, 1925, the Attorney General stated the report submitted indicated such violations and ordered the inquiry to be brought down to date. The Federal Trade Commission then reversed itself refusing further information and at the end of the year the Department of Justice announced that it had examined the charges brought to its attention and that it could see no reason for criminal prosecution of the company or its officers. The industry was active during the year and in 1924, when statistics were returned for production and value, the primary metal produced was valued at \$37,607,000, and the secondary metal, based on the average price at the New York market, at \$14,596,200, as compared with \$41,375,000 for primary metal in 1920, the record year, and \$12,014,600 for secondary metal in 1919. In 1923 the value of primary metal produced was \$28,305,000 and of secondary metal \$10,824,600. The imports into the United States of crude and semi-crude aluminum in 1924 totaled 31,809,941 pounds, valued at \$6,859,785, while manufactures of aluminum in addition were valued at \$285,251, making a total of \$7,145,036 as the total value of imports for the year. In 1924 the exports from the United States were valued at \$4,172,390 including 6,343,512 pounds, valued at \$1,632,315 and manufactures valued at \$2,540,075. During the year 1924 the price ranged from 27.7 cents a pound to 26.3 cents a pound. The Aluminum Company of America was importing an increased amount of raw material from Dutch and British Guiana,

so as to conserve its supplies of bauxite from Arkansas. See BAUXITE.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

**AMERICAN FIELD SERVICE FELLOWSHIPS FOR FRENCH UNIVERSITIES, INC.** See UNIVERSITIES AND COLLEGES.

**AMERICAN-GERMAN STUDENT EXCHANGE.** See UNIVERSITIES AND COLLEGES.

**AMERICAN INSTITUTE OF INTERNATIONAL LAW.** See INTERNATIONAL LAW.

**AMERICAN LEGION.** See LEGION, AMERICAN.

**AMERICAN SCANDINAVIAN FOUNDATION.** See UNIVERSITIES AND COLLEGES.

**AMERICAN SCHOOL AT ATHENS.** See ARCHEOLOGY.

**AMERICAN SCHOOL AT CORINTH.** See ARCHEOLOGY.

**AMHERST COLLEGE.** An institution of higher learning at Amherst, Mass.; founded in 1821. For the 1925 fall term 696 students were enrolled, including 13 graduates and six fellows. The faculty numbered 59. The productive funds of the institution amounted to \$7,000,000, and the income for the year was \$535,000. The library contained 142,000 volumes. Appleton Hall was improved during the year, providing better quarters for the department of botany, and a number of recitation rooms for general purposes. In it were President Hitchcock's Technological Collection, and the Gilbert Collection of Indian Relics. Morrow Dormitory, designed to accommodate 63 students and one member of the faculty, the gift of Mr. and Mrs. Dwight W. Morrow, was under construction in 1925. The opening of Hitchcock Memorial Field, named in honor of Dr. Edward Hitchcock, '49, adjoining the gymnasium, provided about 40 acres of space for outdoor sports, and the accommodation at one time of 300 students engaged in the various outdoor activities. The Indoor Athletic Field, located on the western side of Hitchcock Memorial Field, was completed in March, 1925, and provided space, 160 sq. ft. by 80 ft. high, with glass and slate roof, for a running track on a dirt floor 12 ft. wide, and space for baseball practice and field events. Adjoining property was secured for the erection of a new gymnasium. Lentell House was remodeled to serve as a faculty club house, in which provision was made for a college guest room. In the fall of 1925 the first of the three units in the proposed central heating plant was completed. Publication of the first series of *The Amherst Books*, a series of volumes written by Amherst men, resulted in a second series being started with *Amherst Undergraduate Verses* compiled by David Merton and *The Miner's Freedom* by Carter Goodrich as approved titles. A faculty editorial board was in charge of the enterprise, with Professor H. H. Plough, the managing editor. President, George Daniel Olds, LL.D.

**AMUNDSEN'S EXPEDITIONS.** See POLAR RESEARCH.

**ANALYSIS, CHEMICAL.** See CHEMISTRY, INDUSTRIAL.

**ANALYTICAL CHEMISTRY.** See CHEMISTRY.

**ANÆMIA, PERNICIOUS.** Our knowledge of

this mysterious affection in 1925 was in a state of transition owing to the cumulation of evidence pointing to an intestinal origin. The late Dr. C. A. Herter had announced as long ago as 1906 the probable source of the disease in a toxic substance produced by a microorganism known as Welch's bacillus; and more recently this view had received confirmation from the work of Kahn and Torrey of Cornell University who found this organism in every one of 33 cases of the disease examined by them. The toxic product of the bacillus had been shown to produce in monkeys a disease closely resembling pernicious anemia in man and characterized by the destruction of the red corpuscles, sore mouth and nervous symptoms of the latter. Biochemists have found that in pernicious anemia there is an excess of combined phenol with some free phenol in the blood, which discovery again points to an enteric origin. Finally the surgeons of the Mayo Foundation (*Journal American Medical Association*, July 4), corroborated by Continental operators, have made the discovery that the operation of ileostomy (formation of an artificial anus in the lower small intestine) exerts a very favorable action on the disease, probably because it prevents absorption of poisonous matter from the colon.

**ANATOLIA.** That portion of the Turkish Republic which corresponds to Asia Minor; the peninsula at the western extremity of Asia bounded by the Black Sea on the north and the Mediterranean on the west. Area estimated at 200,000 square miles; population, 9,000,000 to 10,186,900. See **TURKEY**.

**ANDORRA, an-dōr'ra.** One of the smallest republics in the world, under the joint suzerainty of the French president and the Spanish bishop of Urgel; situated in the valley of the Pyrenees. Area, 191 square miles; population, 5231. The inhabitants speak Catalan and are Roman Catholics. The government is under a council of 24 members which nominates a First Syndic in whom is vested the executive power.

**ANGINA PECTORIS.** Surgical relief of angina pectoris by 1925 had become a recognized procedure and Dr. H. H. Kerr, writing in the *Annals of Surgery* for September, compiled a list of 71 cases with numerous cures and improvements and some failures and fatalities. The general feeling in regard to the use of this resource was somewhat skeptical. The subject with angina pectoris is commonly looked on as having extensive pathological alteration in the heart muscle and its nutritive blood vessels, lesions which cannot be visualized as curable under any circumstances. The Allbutt type of the affection, on the other hand, is seated not in the heart at all but in the first portion of the aorta and chiefly in the outer coats. A comparatively slight degree of inflammation here may be responsible for the severe painful crises known as angina pectoris. While this affection may be and often is associated with severe disease of the heart the latter may be quite intact in other cases. It is in just this group that the operation may be safely performed and with excellent prospects of cure, but it is hardly possible to select these cases from among others. While the surgeon would not care to operate in the presence of a badly degenerated heart it is also true that a fatal outcome of operation has been seen when autopsy disclosed no reason for the death. The operation is by no means a standardized proce-

dure but there is an entire group of interventions differing notably in scope and severity. The reflex arc, which must be broken somewhere to abolish the reflex spasms, is composed of the cervical sympathetic and the vagus systems and division may be made in different nerves and at different levels. Instead of simple division a portion of nervous tissue may be excised outright. One surgeon may prefer to resect the inferior cervical nerve and first thoracic ganglion; another, like Dr. Kerr, believes that avulsion of the left superior cervical ganglion (sympathectomy) will do all that any operation can do while being relatively safe. A third simply divides the left superior cardiac nerve. The operation of sympathectomy so-called has long been practiced for other affections and has the advantages of a well established procedure. It consists in the excision of the left superior cervical ganglion. If operation on the left side fails it may be repeated on the right side. In Dr. Kerr's personal series of eight cases he obtained five cures or complete relief with one failure and no mortality. There should be no operative mortality and no operation with involvement of the myocardium, but it is not always possible to discriminate between the Allbutt type and chronic coronary artery obstruction.

**ANGOLA** (an-gō'la), or **PORTUGUESE WEST AFRICA.** A colony on the western coast of Africa, belonging to Portugal since 1575, with the exception of the years 1641 to 1648 when it was held by the Dutch. Its present boundaries were assigned by conventions of May 12, 1886, Dec. 30, 1886, May 25, 1891, and June 11, 1891, separating it from the French Congo, Southwest Africa (afterward united with the Union of South Africa), Belgian Congo, and British South Africa (now Union of South Africa), respectively. Area, 484,800 square miles; population, according to Portuguese estimates, 4,119,000, but the native population was estimated as low as 2,124,361 in 1914. Capital, Sao Paulo de Loanda; other important towns, Kabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander.

There are said to be 52 government schools, 7 municipal schools, and 2 private schools, with about 2410 pupils altogether. The chief products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Rubber, which has been an important industry, is nearly exhausted, and cotton growing, which in the past was highly remunerative, has declined, although recent reports indicate its revival. Mineral products include malachite, copper, iron, petroleum, and salt, and gold has also been found. No later statistics on trade are available than those given last year, when the imports for the first half of 1923 were 92,524,533 escudos and the exports, 62,093,772 escudos. The bulk of both import and export trade was with Portugal. Angola has its own budget, the revenues for which are derived largely from taxation and customs duties, although from time to time the home government grants a subsidy. The estimated revenue and expenditure for the year 1923-24 balanced at 203,725,000 escudos. In 1925 the length of railways open for traffic was 818 miles. The government is in the hands of a high commissioner, whose seat of government is at Loanda. The province is divided into eleven administrative districts, each under a governor.

**ANHALT**, än'hält. A German free state, formerly a duchy of the German Empire, bounded by the Prussian provinces of Brandenburg and Saxony. Area, 888 square miles; population in 1919, 334,159. Capital, Dessau with 57,674 inhabitants in 1919. Other cities with their population in 1919 are: Bernburg, 33,724; Cöthen, 22,898; Zerbst, 19,585; Rossau, 11,540. The majority is Protestant, the Catholics numbering 12,755 and the Jews, 1383. The estimated revenue and expenditure for the fiscal year, 1924, balanced at 20,216,000,000 marks. The government under the constitution of the free state of Anhalt dates from July 18, 1919, and by the law of Nov. 6, 1922, the administration is carried on by a ministry of state consisting of the prime minister or minister president and two other ministers. As a result of an election held in 1924 the following parties were returned to the legislature: Socialists, 15; Middle Class Party, 14; Democrats 3; Communists, 2; National Socialist, 1.

**ANIMAL DISEASES.** See VETERINARY MEDICINE.

**ANIMAL INDUSTRY, BUREAU OF.** See VETERINARY MEDICINE.

**ANIMAL PARASITES.** See VETERINARY MEDICINE.

**ANNAM**, än-näm'. A French protectorate forming a part of French Indo-China (q.v.), whose present status was established by the treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1920, 5,731,189. In 1923 there were 2193 Europeans, exclusive of the military forces. Capital, Hué, with a population of 60,611; largest town, Binh-Dinh with 74,400. The population is Annamite in the towns and along the coast, while Moi tribes inhabit the highlands. The products include rice, cotton, corn, and other cereals, mulberry, the arica nut, cinnamon, tobacco, sugar, betel, manioc, and bamboo. The forests produce coffee, dye, and medicinal plants, caoutchou, and cardamoms. Raw silk is also produced. One of the most important products is rice. Of the minerals, copper, zinc, coal, hematite, iron, and salt are worked to some extent. The exports in 1923 were 47,630,454 francs and the imports 36,397,396 francs, in each case a considerable increase over the preceding year. Shipping at the port of Tourane in 1923: 55,198 tons of which 22,759 tons were British and 23,302 tons Chinese. The nominal head of the government is the king, but actual power is vested in the French Resident Superior. French troops are in occupation of a part of the citadel at the capital. King in 1925, Khai-Dinh who died November 6. See KHAI-DINH. French Resident Superior, M. Pasquier.

**ANNIVERSARIES.** See CELEBRATIONS.

**ANTARCTIC REGIONS.** See POLAR RESEARCH.

**ANTHROPOID APES.** See ANTHROPOLOGY.

**ANTHROPOLOGY.** The year 1925 was relatively unproductive, marked by a paucity of ethnographic publications, which were perhaps fewer than at any time since the low ebb of publication during the World War. This was presumably only a temporary state, for investigations and expeditions continued unabated, and if anything, somewhat more frequent than in the immediate past. Apart from the news early in the year of the discovery of an important link in man's ancestry with the anthropoid apes, the

Taungs skull, there were no important finds. Subsequent examination indicates that the importance of even this had been greatly overestimated. The year also saw the death of several important figures, notably Rudolf Martin, the foremost physical anthropologist.

A project fathered by the Australian National Research Council to stimulate interest in anthropology in Australian universities produced results in the establishment of a department at the University of Sydney, financed jointly by the Commonwealth and state governments. For the present only a professor was to be appointed but provision was being made for further expansion. Its success was assured by the appointment of A. R. Radcliffe-Brown, one of the most competent Australian ethnographers. It was expected to emphasize cultural anthropology, to organize research and train officials in Australia, New Guinea, and Melanesia (mandated territories). Late in the year C. Wissler and E. R. Embree visited Australian universities for the Rockefeller Foundation to study their plans for research in human biology.

*Nature* (Aug. 29, p. 322; Oct. 17, p. 585) called attention to the serious curtailment of anthropological research in Germany due to the loss of her colonies. The mandated territories under British administration were now without the official or officially encouraged study of the aborigines which prevailed under German rule. Further restriction appeared in a recent regulation in Australia prohibiting the removal of skeletal material from the country for study, while there was no certainty of its careful preservation there.

A brochure prepared for the International Institute of Anthropology, *L'Histoire des Sciences Anthropologiques en Tchécoslovaquie* (Prague, 1924) illustrated the stimulation in this field in Czecho-Slovakia after the war. It appears that there was little interest in ethnography in the past, curiously enough exceptionally little in that of the homeland.

**NEW JOURNALS.** The new journals include the *Anthropologischer Anzeiger* (Stuttgart), founded by R. Martin shortly before his death, which was intended to provide a critical current bibliography of physical anthropology, together with short articles. In a related field the *Annals of Eugenics* (Cambridge) was inaugurated under the editorship of K. Pearson and E. M. Elderton. The *Zeitschrift für Völkerpsychologie und Soziologie* (Leipzig), edited by R. Thurnwald with F. Alverdes, R. Bolte, B. Malinowski, and E. Schwiedland, made its appearance. The initial article by R. Thurnwald indicated a wide scope of interests to be served. *Language*, the journal of the Linguistic Society of America, indicated a realignment of linguists toward a common attack on unwritten as well as literary languages. In the United States a new series was provided by the founding of the *University of Washington Publications in Anthropology*. The *Indian Antiquary* was put on a permanent basis under the Indian section of the Royal Anthropological Institute.

**THEORETICAL ETHNOLOGY.** The theoretical foundations and the methods of the American anthropological school have been succinctly restated by A. A. Goldenweiser (*Jour. Amer. Sociology*, 31, p. 19). In particular the rôle of diffusion is contrasted with its place in certain

European schools. As an agent of cultural transformation its prime importance is recognized, yet it is not such to the exclusion of convergent developments, as the extreme diffusionists headed by Elliot Smith have it. Investigations of its action must be intensive and critical, the criteria of similarity cannot be mechanically applied as by the diffusionist school of Graebner and Schmidt. Goldenweiser neglects to make clear however that the American method insists on a weighing of alternative explanations for the similar cultural traits under observation, and its interest in the dynamics of culture transformation rather than the sequence of cultural events.

An example of the culture-complex method of Graebner-Schmidt was seen by Wölfel (*Anthropos*, 20, pts. 1-2) in the association of trepanning for injuries made by stone-headed clubs with the "two-class" system in Melanesia, New Guinea, and America.

Strictures on the use of *Diffusion as a Criteria of Age*, made by W. D. Wallis (*Amer. Anth.*, 27, p. 91), are aimed at the belief in some quarters that the most widely distributed culture traits are the oldest. But since traits disappear or are displaced, greatest age is synonymous with greatest distribution only when the trait is spreading, not receding. The relative distribution of traits depends on their character and the readiness of the adopting cultures to receive them. All traits do not have the same possibilities for dissemination, hence the most widely distributed are not necessarily the oldest. Further, since the point of most intensive development of a trait shifts from period to period, that point cannot be taken as the place of origin. As tested by Old World history, distribution is not a safe criterion of age, nor intensive development of origin.

Some relations of anthropology to history were treated by F. J. Teggart in his *Theory of History* (New Haven, 1925). Through a partial misunderstanding of the aims of ethnologists, Teggart finds their theoretical grounding in Compté.

Continuing his unusually careful investigation of the applicability of the Freudian theory of the Oedipus complex to matrilinear society (*Psyche*, Jan., 1925; see YEAR BOOK for 1924), B. Malinowski discovers that perversions occur with frequency in the Amphlettts where sexual license is repressed but not in the sexually free Trobriands. This appears in the form of dreams and acts referring to sister incest. Origin tales stress the maternal uncle rather than the father. G. Róheim also published a psycho-analytic study of *Australian Totemism* (London, 1925).

The derivation of primitive initiation ceremonies from the consecration of the king-priest was put forward by A. M. Hocart (*Folk-Lore*, 35, p. 308). This becomes secularized by the admission of his hereditary group, then of anyone with qualifications or fees; secrecy necessary to his preëminence is however retained.

Investigating the idea that caste in India arose on a physical basis, with the Aryan immigrants maintaining exclusion from the aborigines by endogamy, S. Ghurye (*Man in India*, 1925, p. 4) pointed out that the transitions in physical type are continuous from high to low caste in the United Provinces and Bihar. In Bengal and Bombay however there is no relation

of caste and type. Hence the exclusiveness could have held only for parts of India.

An origin of cross-cousin marriage is suggested on the basis of the African Ashanti conditions by Rattray and Dudley Buxton (*Jour. African Soc.*, 24, p. 83). An individual belongs to both exogamous matrilineal (blood) and patrilineal (spirit) groups. Children are reincarnations of their grandparents; a boy of his paternal grandfather, a girl of her maternal grandmother. They must therefore belong to the same blood and spirit groups. This can only come about through cross-cousin marriage.

The study of kinship nomenclature as a means of discovering the history of primitive social organization had languished for several years. *The Distribution of Kinship Systems in North America* (Univ. Wash. Publ. Anthro., 1, p. 69), the first treatment on a continental scale, was presented by L. Spier. The systems are classified in eight primary types, each of which is found to have definite, continuous distribution. Thus, emphasis on the generation factor is confined to the Puget Sound area, on age discriminations to southern California, on unilinear classification on the maternal side to the upper Mississippi and central Californian valleys and on the paternal side to the upper Missouri and the southern states; three other types are found among the eastern Pueblos, the Eskimo, and through the Great Lakes district.

One general book of the year, A. M. Tozzer's *Social Origins and Social Continuities* (New York) is a sane introduction to the nature of the savage and of his society. The distinction of the savage and civilized man is a difference of degree, not in kind. Differentiating tests of the mentality of races or groups are held invalid or inconclusive. Society is treated as a series of patterns which provide the mechanisms for both the crises of life and of everyday behavior. Its institutions are not necessarily the nodes of a common growth, nor can they be arranged in an orderly series.

The tendency toward a reduction in the number of North American linguistic stocks on further analysis finds example in E. Sapir's inclusion of Subtiaba (Nicaragua) and Tlapanec (Guerrero, Mexico) in the Hokan-Coahuiltecan stock of California and Texas (*Amer. Anth.*, 27, pp. 402, 491). Such a connection was suggested by W. Lehmann in 1920. A careful analysis of the Wiyot language of northern California by G. A. Reichard (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 22, 1925) is important in view of the earlier suggested connection not only with the neighboring stock, Yurok, but with Algonkin lying east of the Rocky Mountains. A probable connection of the Eskimo languages with Ural-Altaic in the Old World is advanced by A. Sauvageot (*Jour. Soc. Américanistes de Paris*, 16, p. 279).

Following earlier suggestions of connection of racial types of western America with Melanesians and Australians, new evidence in the form of linguistic connection was advanced by P. Rivet (*Anthropos*, 20, 1925, p. 51). He found resemblances of the Hokan languages with Melano-Polynesian and of the Tson group (Patagonian and Ona) with Australian. This conclusion is however based on a small number of corresponding words.

**PHYSICAL ANTHROPOLOGY.** The startling announcement of an anthropoid skull with homoid

suggestions from Taungs. Bechuanaland, South Africa, by R. A. Dart (*Nature*, Feb. 7, p. 195) promised a find of considerable importance. If no more than anthropoid, it was the first fossil of that form south of the Fayum, Egypt. But skull, (deciduous) dentition, mandible, and endocranial cast are all more humanoid than anthropoid according to Dart and cannot be ancestral to any living anthropoid. A new group name *Australopithecus africanus* is assigned. Discussion developed that this conclusion was not immediately acceptable to Keith, Smith Woodward, Duchworth, Sollas, and Boule, although favored by Elliot Smith and Broom. (*Nature*, Feb. 14, p. 234; Apr. 18, p. 569; June 13, p. 908; *L'Anthropologie*, 35, p. 123.) These stress the youth of the individual, pointing out that young apes are known to resemble humans. A. Keith holds it to be definitely anthropoid. The refinements of face and jaw, and the narrowness of head (it is the first dolicocephalic anthropoid) correspond to similar human variations (*Nature*, July 4, p. 11). On the side of its antiquity, R. B. Young, who brought the skull to light, indicates that the limestone from which it came is not older than the Pliocene and may be later. More important, the skull, found in a fissure, seems to have been washed in (*Trans. Geol. Soc. S. Africa*, 28, 1925, p. 55). E. H. L. Schwartz holds it is of modern date, for the tropical forest in which it must have lived, disappeared relatively recently (*Nature*, July 4, p. 22). On zoological grounds W. D. Matthews holds (*Natural History*, 25, p. 409) that if the type is related to man, with its position on the margin of the Old World land-mass, it must represent a recent marginal survival, not an ancestral type, which must still be sought in Asia.

A Neanderthal skull found by Turville-Petre in a cave near the Lake of Galilee most closely resembles the Krapina variety (A. Keith in *London Times*, Aug. 14). Its cranial capacity is little short of modern Europeans'. The associated stone implements are transitional Acheulean-Mousterian.

The rear section of a skull found in London, probably of late Pleistocene date, is unusually interesting, according to G. Elliot Smith (*Nature*, Nov. 7, p. 678), in that it presents "the nearest resemblance to the Neanderthal type ever found in a member of the species *sapiens*."

W. P. Pycraft, on reexamining the Boskop skull found in 1913 in the Transvaal, holds it to be a derivative of Cromagnon man and the progenitor of the Bushman and Strandlooper (*Jour. Royal Anth. Inst.*, 1925, 179). He proposes incidentally, contrary to the general belief that all living races and Cromagnon are varieties of a single species (*Homo sapiens*), to distinguish as distinct species, Bushman-Strandlooper, Negro-Negrillo, Tasmanian, Cromagnon-Caucasian-Mongoloid-Polynesian-Australian.

Four racial types are discriminated in the populations of Beluchistan and Afghanistan by B. Datta (Charlottenburg). The first biotype is dolicho-leptorrhine (Pathans, etc.); the second, related to the Armenian type of Asia Minor, is brachycephalo-leptorrhine (Mengel, etc.); the third, which came from central Asia, is brachycephalo-mesorrhine (Iranian speaking peoples of the Pamir, etc.); and the last, which is the earliest in this region, is dolicho-mesorrhine (Baluchs, etc.).

The little known skeletons of Wauwiler, Lu-

zern, are monographically treated by O. Schlaginhaufen (Munich, 1925). These date from the earlier Neolithic or possibly Mesolithic. An especially important find from Egozvil bore resemblance to the negroids of Grimaldi and to the type of Le Placard among fossil types. It bore no resemblance to modern European types but in the nasal configuration has analogs in Africa, South Asia, and Melanesia.

*The Ancient Inhabitants of the Canary Islands* was the subject of an extensive monograph by E. Hooton (*Harvard African Series*, VII). This presents a summary of the ancient ethnography of these people as well as their physical type.

The early migrants into America via Bering Straits were of four Indian stocks, according to A. Hrdlička (*Ann. Rept. Smithsonian Inst. for 1923, 1925*, p. 482). The first in point of time were dolicocephals represented in North America in the northeast, the Plains and western basins, and in South America in the east from Venezuela to Cape Horn. They were followed by the brachycephals of the Mississippi region, the South, Mexico, Central America, and Peru. Still later the Eskimo and Athapaskan types entered, the latter making its way southward as far as North Mexico. The "Lagoa Santa race" of South America, thought to have Papuan and Melanesian affiliations by certain European physical anthropologists, is viewed as part of the first dolicocephalic stock. The Australoid characteristics of *The Punin Calvarium* from Ecuador, possibly of Pleistocene age, were noted by Sullivan and Hellman (*Anthro. Papers, Amer. Mus. Nat. Hist.*, 23, pt. 7). In general it is of this Lagoa-Santa type.

A critical estimate of the several theories of the Indian caste system, especially of the ethnic theory, led to a reexamination of race classification in that country by G. S. Ghurye (*Man in India*, 4, p. 209). Risley's seven racial types were held to be incomplete.

Further detailed measurements of boys in two eastern provinces of China were analyzed by S. M. Shirokogoroff (*Process of Physical Growth Among the Chinese*, Shanghai, 1925). Variations in the course of growth distinguish the groups: Kiangsu males being in advance in body measurements, Chekiang in dentition.

Contrary to the commonly assumed heterogeneity of Negro-White populations, that of New York investigated by M. J. Herskovits under the direction of F. Boas (*Jour. Amer. Statistical Assn.*, 20, p. 380), is relatively homogeneous. This is shown by the smaller variabilities of family strains than within individual families. This suggests that the Negro-White crosses are some generations back.

**OLD WORLD PREHISTORY AND ETHNOGRAPHY.** The new German encyclopedia of antiquities (*Reallexikon der Vorgeschichte*, Berlin), which appeared last year, is now in its third volume. This is an excellent summary of the enormous field of prehistory and classical, Near Eastern, and Oriental life, together with significant data on modern aborigines, their religion and social life. The work is by a group of north European scholars under the direction of M. Ebert.

Finds of presumably Pleistocene age in southern China by Licent and Teilhard de Chardin show the presence of a Mousterian or early Aurignacian industry at three sites (*L'Anthropologie*, 35, pts. 3, 4). A significant find of

stone implements of Palaeolithic type was made by Mansuy in Tonkin, Indo-China, a region from which only Neolithic forms had been reported. A few of these new specimens show some slight polishing on the edge in addition to the characteristic Palaeolithic flaking. Skeletal remains suggest a mixed population with Indonesian, Papuan, and Negrito affiliations (R. Verneau, in *L'Anthropologie*, 35, p. 47; *Comptes Rendus Hebdom. Séances Acad. Sci.*, 179, p. 416). Azilian and Mousterian types of implement are reported from the Gobi Desert by the expedition of the American Museum of Natural History in Mongolia.

J. G. Anderson's reports on two new and important early sites in north-western China during the year became available (*Palaeontologica Sinica*, D. I: *Geol. Survey of China Bull.* 5). These are a cave in Fengtien and an extensive village site in Honan, both of Neolithic age, and containing celts, spinning whorls, slate arrowheads, and handmade pottery. One pottery form has persisted in modern China. L. H. Dudley Buxton pointed out (*Man*, 25, 2, 19) that the polychrome ware is of a type distributed from Asia Minor to the Pacific.

Stratification of Aurignacian over Chellean or Acheulean tools is recorded for Rhodesia by N. Jones (*Jour. Roy. Anth. Inst.*, 54). The finding of further Chellean and Acheulean-like implements in the same region is reported (*Nature*, July 11, p. 59). A large number of implements of Acheulean type were found at Lent Rise, Bucks., England.

The geologist G. de Geer summarized his investigations of the late Pleistocene ice movements in Scandinavia with a view to fixing the prehistoric time intervals (*Ymer* [Stockholm], 1925, 1). The beginning of the Neolithic (post-glacial) is given an antiquity of 8700 years, of the Bronze Age 3800, and of the Iron Age 2450. Early in the year a new Neolithic lake-dwelling was found near the shores of Lake Zurich.

The Bronze Age invaders of Britain entered from the southwest, from the Wash, and in east York-shire, according to Flinders Petrie's study of the distribution of pottery (*Man*, 35, p. 42). Their avoidance of southeastern England suggests that this fertile area was strongly held by their Neolithic predecessors.

The important Iron Age cultures of central Italy, which form the background of Roman history, were reexamined in Randall-MacIver's *Villanovans and Early Etruscans* (Oxford). His new thesis was that the Villanovans were not direct descendants of the Terramaricoli, but a later kindred people from central Europe, and the Etruscans arrived only in the eighth century B.C. when the Villanovan civilization was well advanced. An important excavation was made at the mound of Vardaravtse, near Salonica, where stratified deposits were found dating from Mycenaean to Hellenistic times.

On the basis of cephalic indices and some magical customs of peoples on the White Nile, C. G. Seligman holds (*Jour. Roy. Anth. Inst.*, 55, p. 15) that there has been an eastward movement of southern Soudanese. A brief account of the Kuku and other minor tribes north of the Uganda Protectorate in east Africa was published in *Sudan Notes and Records*, 7, pp. 1-41. Additional material on the Bushongo and their neighbors of the southwestern Congo were presented by E. Torday (London, 1925). The

Rhodesian ruins and mines, which had been ascribed to Arab and Egyptian as well as native sources, were found to contain skeletal remains of Bantu type alone. (*Proc. Rhodesian Sci. Assn.*, 23). Hunting and hunting methods among African peoples were described by G. Lindblom in a publication of the *Naturhistoriska Riksmuseet* (Stockholm, 1925).

The *Social Organization of the Nama Hottentots*, as reconstructed by A. W. Hoernlé (*Amer. Anth.*, 27, 1), shows a series of scattered tribes holding definite water-holes in the semi-desert of southwest Africa. They comprise patrilineal exogamous sibs taking their names from the chiefs from whom they descended in theory. Sibs tend to independence as tribelets. Chieftainship is hereditary in the genealogically senior sib. Each sib, and each tribelet, has a definite place in order of seniority in the tribe's circular encampment. Seniority also appears in kinship terminology and regulations. Cross-cousin marriage is possible but irregular. From the same general region S. S. Dornan's *Pygmies and Bushmen of the Kalahari* (London, 1925) provided further knowledge of the Bushmen and some of their neighbors.

The *Aboriginal Tribes of Assam* (London, 1925) was described by W. C. Smith, and G. Horne and G. Aiston contributed a sketch of the Wonkonguru (*Savage Life in Central Australia* [London, 1924]).

An account of the Maori by E. Best (Wellington, N. Z., 1924) was especially rich on religion and material culture. K. P. Emory described the archaeology of *The Island of Lanai* (*Bishop Mus., Bull.* 12, 1924), one of the central Hawaiian group. *The Social and Political Systems of Central Polynesia* (Cambridge) were surveyed at length by R. W. Williamson in the form of variations from a Samoan norm. The dual organization was interpreted as due to a conquering people. Matrilineal descent, exogamy, and totemism formerly existed in this area.

NEW WORLD ETHNOGRAPHY. As the most comprehensive treatment of any ethnographic area, A. L. Kroeber's *Handbook of the Indians of California*, published by the Bureau of American Ethnology (Bull. 78), was one of the notable achievements of the year. The cultures of all groups in this area are systematically presented and their interrelations traced. Much of the material is available for the first time: the remainder is a series of competent summaries. The culture of the area is not homogeneous as older ethnology had it, but of three specific types centering in the northwestern corner, the central valley, and on the southern coast, with the northeast and lower Colorado partially distinct. These in turn are properly viewed as sub-centres of the larger Northwest Coast, Basin, and Southwestern culture areas familiar to Americanists. While this presentation is largely in the form of a classification of cultures, Kroeber is not satisfied with such a static conception, but views the successive specializations of these subcultures, their subdivisions, and each tribe within them, as pointing the course of culture history in this region. (See the *YEAR BOOK* for 1924, p. 44.) At the same time it must be noted he offered little concerning the processes of such culture growth.

*Observations on the Ethnology of the Sauk Indians*, published in 1923 (*Bull. Pub. Mus. Milwaukee*), were continued by A. B. Skinner

with a description of war customs and material culture. Similarly F. La Flesche added to his account of *The Osage Tribe* an extensive rendition of the Rite of Vigil (*Thirty-ninth Ann. Rept. Bur. Amer. Ethnol.*).

The first part of a study of the growth of Tainan (Arawak) culture in the Antilles by S. Loren (Gothenberg, 1924) dealt with material culture.

The most systematic treatment of folk-tales during the year was E. Gunther's *Klallam Folk Tales* (*Univ. Wash. Publ. Anthro.*, 1, p. 113). The typical tale of this Puget Sound people is short, with definite plot and few explanatory elements. Historical connection with the north, particularly with Vancouver Island tribes, was indicated by the frequency of analogous tales in that region.

A point of some interest in connection with K. Rasmussen's extended (Fifth Thule) expedition was the discovery of an unknown group of Eskimo, 300 miles southwest of Chesterfield Inlet, Hudson's Bay. These are caribou hunters, not coastal Eskimo, and may represent the ancient Eskimo type of life.

An ethnographic sketch of *The Toba Indians of the Bolivian Gran Chaco* (*Acta Academiae Aboensis* [Finland], Humaniora, IV, p. 4) was a valuable addition to knowledge of a little known region. Though primarily a fishing and hunting people, agriculture is practiced. Chieftanship is hereditary but dependent on fitness. Shamanistic curing of the sick and simple dances constitute the ceremonials. In general the opinion of R. Karsten is that this simple culture occupies a place intermediate between the more primitive Matacos, Chorotis, and Ashluslay and the relatively advanced Avas or Chiriguano.

The area of pre-Columbian Pueblo culture was extended westward into southeastern Nevada by the discoveries of M. R. Harrington. This group of ruins consists of rectangular cells constructed of adobe masses and slabs, somewhat after the manner of the early "slab-houses" of this region. Evidences of small circular kivas (ceremonial chambers) were found. The Harvard Southwestern expedition uncovered a transitional stage between pre-Pueblo and Pueblo cultures in the Chinlee valley, northeast Arizona.

The number of cases of cultural stratification from the Arctic to Peru reported during the year evidenced progress in the solution of New World chronology. An ancient Eskimo culture has been established in the region about the mouth of Hudson's Bay by T. Mathiasen of the Rasmussen expedition (*Geografisk Tidsskrift*, 27, p. 191). Circular semi-subterranean huts and utensils differing from those of the modern Eskimo were found at levels which suggest that the land was then about ten meters below its present level. D. Jenness discovered still another culture at Cape Dorset, Baffin Land, earlier than that of Mathiasen (*Geographical Review*, 1925, p. 428). It is characterized by the same type of house, a peculiar harpoon type, but especially by the absence of drilled specimens.

Fresh stratified deposits near Tampa, Florida, confirmed earlier reports of cultural changes in this region (J. W. Fewkes, *Smithsonian Misc. Coll.*, 76, no. 13). The lowest stratum contains pottery suggesting connection with the pre-Tainan Ciboney culture of Cuba, while the decorated pottery of the upper connects with the mainland to the north. A human skull and

stone arrowheads found in association with mammoth and mastodon remains near Vero, Florida, may be of late Pleistocene age, the fauna surviving until late in this region (*Science*, Aug. 2, 1925).

Subdivision of the Archaic (the earliest known) culture of Mexico has been attempted on the basis of pottery types by A. L. Kroeber (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 17, no. 7). The sequence is marked by a diminution of incising, the increasing frequency of painting and of polychrome ware. The culture as a whole is definitely of the general type of south Mexican cultures of historic times. A new archaeological site at Culiacan in Sinaloa, Mexico, promises to fill a large gap between central Mexican and Pueblo cultures (*Anales Mus. Nac. de Arqueologia*, Mexico, 3, 1925, p. 57).

A series of migrations for the Maya-Huastec population of Mexico was outlined by R. Schuller (*Ethnos* [Mexico], 1925, I, p. 52). A movement of Huastecs from the south was followed by a counter movement of the Mayas into their historic location in Yucatan, and of the Nahua groups into the valley of Mexico from the west.

An identification of the month names of the Maya calendar with the round of agricultural activities is made by J. S. Thompson (*Man*, Aug., 1925), who assumes the ancient procedure closely follows the modern. This differs from Spinden's year which begins with the winter solstice. Excavations at Chichen Itza, Yucatan, by S. G. Morley during 1925 uncovered a temple of the Mexican period noteworthy for its carved columns. The whole northern section was built during this period (XII-XV centuries A.D.).

In Salvador S. K. Lathrop finds that figurines of sub-Mayan type and Archaic Mayan pottery come largely from Lenca territory north of the Rio Lempa, while the Mayan polychrome pottery comes from southwest of this river, a district occupied by Nahua-speaking Pipil at the Conquest.

Continuing the study of ancient Peruvian ceramics, W. D. Strong found in *The Uhle Pottery Collections from Ancon* (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 21, p. 135) further indirect evidence of the sequence of types. Although five periods are distinguished, the development of the pottery at this coastal site was local, relatively uninfluenced by the higher centres of Peruvian life. M. Uhle's initial date of 100 B.C. for the first period is held a reasonable approximation.

The uncertain character of the Peruvian quipus, or string records, received a partial solution from E. Nordenskiöld (*Comp. Ethnol. Studies* [Göteborg], 6, pt. 1), who points out that these are known only from Inca graves and consequently had no connection with the living.

HONORS, EXPEDITIONS. PERSONALIA. The Huxley medal of the Royal Anthropological Society was awarded to Sir William Ridgeway for his studies in Mediterranean archaeology. J. Kleiweg de Zwaan of Amsterdam has established a triennial prize of about 2500 francs for the best work in physical anthropology or prehistory. A volume was published in honor of Prof. Michael Haberlandt's thirty years as leader of the Verein und Museum für Volkskunde in Vienna. Dr. Robert Lehmann-Nitsche received the honorary degree of Ph.D. from the University of Hamburg in November, 1924.

The Museum für Völkerkunde in Leipzig had expeditions in southern Abyssinia, Turkey and Persia, and added collections from Kamerun, Dalmatia, Turkey, Palestine, and from the Vogul. The Munich Museums für Völkerkunde, now moving into larger quarters, will reopen its collections next year. Financial difficulties curtailed Austrian activities, as at the Naturhistorisches Museum in Vienna, which is however occupied with the collection made by the Archduke Franz Ferdinand.

The ethnological department of the Naturhistoriska Riksmuseet in Stockholm sent G. Moberg collecting in the Sahara from Tunis to Kano, Nigeria, with special attention to the Touareg. Several collections were added; from the African Turkana and Ovambo, New Hebrides and New Caledonia, Navaho, and southwestern Asia. South America continued to hold the interest of the Göteborg Museum, with collections from the Goajiro (Columbia) by G. Bolinder and the continued archaeological investigations on the lower Amazon (Caviana and Santarem) by C. Nimuendajus, and of Peruvian quipus by E. Nordenskiöld. A new series, *Ethnographical Studies in Celebes*, was based on the collection of W. Kaudern. Four expeditions of the Royal Netherlands Geographical Society were made during the year; by Witkamp to central Borneo, Visser to Krakorum, and the Djambi and Surinam expeditions.

Lord Denbigh presented the Pennant collection, containing objects obtained by Capt. Cook in the Pacific, to the Anthropological Museum, Cambridge. Collections of Oceanic material were added to the Otago University Museum and Auckland Museum in New Zealand. In addition to the South African activities in human palaeontology and archaeology noted above, the Department of African Life and Letters of the University of Cape Town has had Miss Bleek among the Bushmen of southern Angola, Dr. Beech investigating tones in Southern Bantu language and Hottentot phonetics, and A. J. H. Goodwin on preliminary work for an archaeological survey of South Africa.

Activities of American institutions continued to be numerous, for, while among larger institutions the work of the American Museum of Natural History was still limited, the Field Museum of Natural History had resumed its former extensive program. The joint expedition of the Field Museum with Oxford University to Mesopotamia was being energetically pushed. A. L. Kroeber investigated possible stratifications of culture in Peru for this museum; M. G. Chandler collected among the Central Algonkin, and R. Linton left in October for a two years' ethnological exploration of Madagascar. An extensive collection from the Cameroons was added. The U. S. National Museum had N. M. Judd continuing excavations at Pueblo Bonito, New Mexico, and H. B. Collins exploring the mounds of the Choctaw area. In conjunction with the Buffalo Society of National Science, A. Hrdlička visited sites in India, Ceylon, Java, Australia, and South Africa, examining fossil human remains. A collection from the San Blas Indians, Panama, was presented by the Marsh-Darien expedition. The expedition of the American Museum of Natural History to Mongolia included this year N. C. Nelson as archaeologist. A. V. Kidder, E. H. and A. K. Morris excavated

in Canyon del Muerto, N. Mex., and E. Schmidt near Globe, Ariz., for this museum.

The Bureau of American Ethnology furthered archaeology work by G. Fowke in Louisiana, H. B. Collins in Mississippi, E. H. Morris and H. S. Colton in Arizona, all under the direction of J. W. Fewkes. Field studies were continued by T. Michelson of Sauk-Fox and other Central Algonkins, J. P. Harrington in California, J. N. B. Hewitt of Iroquois, F. La Flesche of Osage, and J. R. Swanton of Creek. The Carnegie Institution of Washington inaugurated a ten years' plan of excavation and restoration of Chichen Itzá, Yucatan, by S. G. Morley. M. Mead left for Samoa for the National Research Council. J. C. Cooper of the Catholic University, Washington, studied the Tetes de Boule, Canada. The Museum of the American Indian had a number of parties in the field: M. R. Harrington to the Lovelock caves, Nevada, and to pre-pueblo sites in southeastern Nevada; M. R. Gilmore to the Omaha, Arikara, and other Plains tribes; W. Wildschut to Shoshoni and Bannock; E. H. Davis to Seri and Yaqui; F. G. Speck to Eskimo and Indians of Labrador and Greenland; D. A. Cadzow to Bungi and Plains Cree. Several expeditions of this institution to Central and South America included S. K. Lathrop for archaeology of Salvador and Rio Parana, A. H. Verrill for ethnology to Panama and the northern Andes, P. H. Fawcett through Brazil, and D. E. Harrower to eastern Nicaragua. The University of Pennsylvania Museum continued archaeological research in Palestine, Mesopotamia, and Alaska. The Peabody Museum (q.v.) of Harvard continued excavations in the Mimbres Valley, N. Mex., and Chinlee, Ariz., and added to its collections material from tribes of the Kimberley region, northwestern Australia and from Uganda (collected by J. C. Phillips). The Bishop Museum, Honolulu, had K. P. Emory continuing on the ethnology of the Society Islands and H. Hornbostel on the northern Marianas Islands.

For the University of California A. H. Gayton visited the Yokuts, F. Clements the Wintun, L. Spier the Klamath, W. D. Strong the tribes of southern California, E. Loeb the Pomo. At the end of the year the last named left for the Mentawi Islands, East Indies, on his own account. E. Schenck investigated the shell-mounds of San Francisco Bay and with W. D. Strong continued excavations at The Dalles and Albany, Ore. The University of Washington sent E. Gunther to the Klallam, R. L. Olson to the Quinault, and L. Spier to the Wishram.

The Victoria Memorial Museum, Ottawa, carried on research in folklore and technology of French Canada through C. M. Barbeau, on the Bella Coola by H. I. Smith, an archaeology of Manitoba-Alberta by W. J. Wintemberg, and western Cree linguistics by L. Bloomfield. A large collection from Baffin Island and Ellesmere Land was added.

The Museo de la Plata (Argentina) collected skeletal material from the delta of the Parana. R. Lehmann-Nitsche and L. M. Torres examined cave paintings on the mountain Cura Malal in southern Buenos Aires. The Museo de Arqueología at Lima made excavations in the cemeteries of the valley of Asia (Cañete) and in Paracas (Pisco) for Inca and pre-Nasca collections.

Among significant changes in personnel were the transfer of A. R. Radcliffe-Brown from

Capetown to the newly created chair at Sydney University, Australia, and E. Sapir from Ottawa to the University of Chicago. G. R. Carline of Pitt Rivers Museum, Oxford, succeeded the late H. Ling Roth at the Bankfield Museum, Halifax, England. W. C. McKern joined the Milwaukee Public Museum, and T. F. McIlwraith the University of Toronto.

**NECROLOGY.** There were a number of deaths of significant individuals during the year in this and closely related fields. The chief among these was Rudolf Martin, the distinguished German physical anthropologist, who held perhaps first place in this branch. The year sees another serious loss in Louis R. Sullivan, a young American, who held great promise for racial studies. The German explorer, Georg A. Schweinfurth, distinguished for his early ethnographic work in central Africa, where he established the existence of pygmies, died September 19. Two ethnographers of eastern South America, W. C. Farabee (an American) and Theodor Koch-Grünberg (German), died since the issue of the last YEAR BOOK. Among Americanists there must be noted Alanson B. Skinner and Charles F. Newcomb, the first known for his work among the Central Algonkin and the latter for collections from British Columbia. The British ethnologist, Henry Ling Roth, known primarily for his works on Tasmania, Borneo, and Benin, all standard in these fields, died May 12. The French archaeologist, Ernest Chantre, who contributed largely to the prehistory of the Rhone basin, France, and of the former Turkish empire, died Nov. 24, 1924. In related fields the death of Henri Cordier (March 16), noted French authority on Oriental languages and best known for his edition of Yule's *Marco Polo*, with that of l'abbé Rousselot (Dec. 16, 1924), whose name is associated with experimental phonetics, are important for anthropology.

**ANTIGUA.** See **LEEWARD ISLANDS.**

**ANTIOCH COLLEGE.** A non-sectarian, co-educational institution of higher learning at Yellow Springs, O.; founded by Horace Mann in 1853. The total enrollment for the fall term of 1925 was 610, of whom 452 were men and 158 women. The faculty numbered 55. The productive funds of the institution amounted to \$119,939.11, and the income from all sources was \$226,932.98. The number of volumes in the library was approximately 17,000. For the organization of the college see the 1923 YEAR BOOK. President, Arthur E. Morgan, D.Sc.

**ANTI-SALOON LEAGUE OF AMERICA.** A federation of churches and temperance organizations in the United States, organized against the beverage liquor traffic. It was established in 1895 by a coalition on the Anti-Saloon Leagues of four States and the District of Columbia. At the end of 1925 it embraced 49 State or Territorial Leagues and had affiliations with 40 other national temperance organizations as well as with the World League Against Alcoholism (q.v.). The work of the League in 1925 was carried on by over 1500 representatives. Its work in 1925 included successful opposition to all wet legislation in Congress, successful advocacy of prohibition appropriations, rehabilitation of the Coast Guard with increased appropriation, and legislation providing special funds for prohibition prosecutions by the De-

partment of Justice, compulsory liquor storage in government warehouses, the use of forfeited automobiles and other vehicles by the Coast Guard and Prohibition Unit, and the ratifying of anti-smuggling treaties with three more nations, making eleven such treaties in effect. It cited as evidence of the advances made in thought the decisions of the Supreme Court in 1925 upholding the right of officers to search automobiles without search warrant when there is reasonable cause to believe liquor is illegally transported, upholding the Georgia statute making it unlawful to possess liquors acquired before the law became effective, and the establishment of the power of Congress to regulate the manufacture and distribution of non-beverage alcohol.

The League issued statistics based on official reports, demonstrating that the consumption of intoxicants had dropped to a small fraction of its former total. It also quoted some census figures issued during the year showing a decrease in drunkenness commitments in 1923 and a decrease in the death rate during 1925. The *American Issue* is the official organ of the League, many State editions being published in addition to the national edition. Its monthly circulation is about one million copies. It is published at Westerville, Ohio. The National Legislative Headquarters are at Washington, D. C., 30 Bliss Building, under the direction of Wayne B. Wheeler, general counsel and Legislative superintendent. The other officers of the League are, President, Bishop Thomas Nicholson, Detroit, Mich.; Secretary, S. E. Nicholson, 70 Fifth Ave., New York; Treasurer, Foster Copeland, Columbus, Ohio; General superintendent, F. Scott McBride, Westerville, Ohio; General manager of publishing interests, Ernest H. Cherrington, Westerville, Ohio.

**APPEN'DICITIS.** In recent years it has been assumed that the great frequency of this affection may be partly the result of local infection from a distance, and that certain special organisms have an elective affinity for the appendix. Given a focus of disease in the tonsils, teeth, etc., in which occur certain organisms prone to find their way to the appendix, the universality of the menace of the disease could be visualized. At the same time it has never been denied that purely local factors in the intestinal tract such as worms, foreign bodies, etc., also play a very active rôle. An exhaustive original study of the causes of the disease by Dr. Warren of Boston (*Journal of the American Medical Association*, July 18) leads him to conclude that infection through the blood has no scientific basis. The simplest and quite sufficient explanation of the disease, which is not new, regards the appendix as an organ much like the tonsil, consisting of crypt-like recesses in which any pathogenic organism may accumulate and under certain circumstances become virulent. Certain structural peculiarities and defects may favor this retention mechanically. The blood infection hypothesis is, to say the least, unnecessary.

**APPLES.** See **HORTICULTURE.**

**AQUEDUCTS.** **CATSKILL AQUEDUCT SYSTEM.**

At the end of the year the Gilboa Dam, referred to in previous issues of the YEAR BOOK, was virtually completed (see DAMS) so that it would be possible to use the Schoharie supply by the middle of 1926. This dam formed a 20,000,000,000-gallon reservoir from which the impounded water of Schoharie Creek would be drawn through the Shandaken tunnel, completed in 1924, to Esopus Creek and into the Ashokan reservoir. The Gilboa Dam was the last link in the Catskill aqueduct system, as originally planned. For the distribution system, contracts were made during the year for 6 miles of steel conduit in Brooklyn, for the most part 72 in. in diameter, which would distribute the Catskill Aqueduct water there. Plans for a second deep tunnel about 20 miles in length and for the most part 17 ft. in diameter were under consideration by the Board of Estimate of the City of New York, plans having been submitted by the Board of Water Supply, but no action had been taken up to the end of the year.

WASHINGTON, D. C. During the year the City of Washington had under construction a 9-mile aqueduct which would virtually afford to that city a second water supply so that not only could the old aqueduct be supplanted, but it could be closed down for the necessary renovation of tunnels and conduits, which had not been dry since their construction in Civil War days. The new water supply system involves not only a new conduit pipe line and tunnel but also a filter plant together with reservoirs and a complete supply system involving the aggregate estimated expenditure of \$9,000,000. The reservoirs and first pressure pipe lines were practically completed at the end of 1925 and the filters were scheduled for completion in the following year.

The new conduit virtually parallels the old structure of General Meigs built in 1863 and for many years considered a notable engineering work. It extends from an intake chamber at Great Falls and between that point and the Dalecarlia reservoir, a distance of about 9 miles. There are involved three types of construction, lined tunnel, plain concrete cut and cover flow line aqueduct, and a reinforced concrete pressure siphon. In place of the historic Cabin John Creek Bridge of the older aqueduct, which afforded a flow line aqueduct from intake to outlet, an inverted siphon is employed for crossing Cabin John Creek. From the intake chamber at Great Falls there is a tunnel 2400 ft. in length and then some 43,835 ft. of cut and cover aqueduct from the end of the tunnel to the Dalecarlia reservoir, the last 800ft. however being in tunnel. At Cabin John Creek the inverted siphon consists of  $\frac{3}{8}$ -in. riveted steel pipe, 10 ft. in diameter, with a 6-in. concrete lining and a 12-in. concrete envelope. In the original aqueduct, 11 miles in length, 1.40 miles were unlined tunnel and the remainder was circular brick or rubble masonry cut and cover conduit. In the new aqueduct, which was built in close proximity to the old structure, a trench was excavated and after the inverted slabs had been cast from a concrete mixer, which traveled along the bank, outside forms were suspended from carriages traveling on rails and inside the interior forms were supported on carriages traveling along the track. The operation of the new aqueduct involved the taking of river water at Great Falls, transport-

ing it to the Dalecarlia reservoir, whence it would flow by gravity to the filtration plant by way of a new 6-ft. diameter branch conduit. Here the water would be treated by mechanical filtration and, inasmuch as the reservoir is at a higher level than is required at the city, the surplus water can be used to generate electric current to do the pumping from the filtration plant to high level reservoirs. The system involves two high-pressure reservoirs, which are rectangular concrete structures with gravity walls and groined-arch inverts and roofs. The capacity of the filter plant is estimated at 80,000,000 gallons per day. The new aqueduct is cross connected with the old by three different connections. This project was described in the *Engineering News-Record* of July 16, 1925.

BOSTON, MASS. The Massachusetts Metropolitan Water Supply Investigation Commission filed a report December 1st, covering the addition to the Boston Metropolitan Water Supply system and that of the City of Worcester. In addition to various schemes for increasing the actual supply, there was involved the important question of bringing the additional water thus secured into the metropolitan district, as existing demands require the full capacity of all available conduit from the Weston terminal of the Weston aqueduct to the centres of distribution. It was suggested that a deep pressure tunnel should be constructed in the underlying rock between the Weston terminal and a point in or near the city of Everett, which would be in the heart of the metropolitan district, at an estimated cost of \$17,000,000. In addition there would be required supplementary siphons on the existing Weston aqueduct and other corrections to insure its full utilization. No definite action had been taken on this report, which recommended that the commission prepare definite recommendations to be reported to the general court on or before December 4, 1926, as to need, location and estimated cost of delivering the future water supply to the distribution system of the metropolitan district either by pressure tunnel or by pipe line. The Investigation Commission also recommended that the legislature appropriate the sum of \$27,500,000 for this work of extension, in accordance with the recommendations made.

LOS ANGELES WATER SUPPLY. During the year the city of Los Angeles, Calif., had under way preliminary surveys and studies to determine the feasibility of constructing a 268-mile aqueduct from the Colorado River to the city limits. This would be some 18 miles greater than the length of the existing aqueduct from Owens Valley, and it was estimated that the cost would be somewhere between \$100,000,000 and \$150,000,000. Filings had been made on the diversion of 970,000,000 gallons per day Colorado River water and with a \$2,000,000 bond issue, voted at the general election, preliminary surveys and studies were actively in progress under the direction of William Mulholland, chief engineer, Los Angeles Water and Power Bureau, who designed and built the former aqueduct. The survey and plans were to be completed during 1926, in the course of which definite estimates would be figured. Instead of using the ordinary form of river diversion and intake, it was proposed that the first 15 miles of the aqueduct should be located in the gravel beds between the banks of the river and the Maria

Mountains thus constituting a filtration gallery into which a constant flow of water free from silt would pass, the flow solving not only the silt problem but avoiding the expense of constructing and maintaining an intake. While the definite location of the route had not been fixed, there were two fixed points through which the aqueduct must pass, one being a pass between the Chuckawalla and the Palo Verde valleys, about 20 miles from the upper end of the aqueduct and about 80 miles from the upper end at Shaver Summit, which separates Chuckawalla and Coachella (Imperial) valleys. The general location was being studied so as to determine how much tunnel would be required or whether pumping should be used, depending upon the various costs. It was estimated that about 75 miles of the aqueduct would be in tunnels, one of which would have a minimum length of 14 miles, on which the driving could be done from the two ends only. This tunnel would be under Beaumont Pass, at the north end of Coachella Valley. All of the tunnels would be west of Shaver Summit and for the most part in granite or limestone. The new aqueduct would not involve the construction difficulties of the older Los Angeles aqueduct as at no point would the route be far from main line railways. Up to the end of the year a large amount of preliminary triangulation and level control had been carried out and a certain number of topographic sheets made, from which, with other surveys, a base topographic map has been prepared showing the country from the Colorado River to the City of Los Angeles, over a strip of territory extending from Needles on the north almost to the Mexican boundary on the south.

**HETCH HETCHY WATER SUPPLY.** At the end of 1925 there had been expended on the San Francisco water and power project a total of some \$44,000,000, exclusive of interest. The mountain division with its storage dams and 18-mile tunnel had been completed together with the Moccasin Creek power house, from which power was being sold to the Pacific Gas & Electric Company. The submarine pipe across San Francisco Bay was being completed and the 21-mile Bay division which would carry Spring valley water, was to be put into commission early in 1926. At the end of the year it was stated that about 45 miles of tunnel and 49 miles of pipe line must be built before the Hetch Hetchy water could be delivered to the city.

**WANAQUE AQUEDUCT.** In the Wanaque water supply, which was constructed by The North Jersey District Water Supply Commission, a notable feature was the supply line leading from the Wanaque reservoir in Northern New Jersey, 25 miles south to Newark. The Wanaque Dam forms a reservoir 6 miles long and 1 mile wide, with a capacity of about 28,000,000 gallons, giving a supply of 100,000,000 gallons daily. The most noteworthy portion of the aqueduct in proper was a 9372-foot tunnel through Watchung Mountain, back of Montclair, consisting of a horseshoe section 7 ft. x 7 ft. inside, lined with concrete from a rock bore about 9 ft. x 9 ft. A similar section 860 ft. in length was being built from the lower gate house of the Wanaque Dam in connection with 250 ft. of cut and cover conduit from the lower gate house of the dam and on the south connecting with 590 ft. of cut and cover conduit,

which joins the main work under construction.

**ST. LOUIS WATER SUPPLY.** During the year contracts aggregating \$5,500,000 were in force for the \$12,000,000 project to bring water to St. Louis from the Missouri River. This involved an expenditure of \$500,000 for land, and the construction of a 16-mile, 60-inch pipe line right of way connecting the station with the city. The complete plant eventually would cost \$25,000,000 and specifications for pumping machinery, settling basins, buildings and filters, were being prepared so that contracts could be made during 1926. It was reported that the intake and engine pits were 80 per cent complete, and the pipe line 75 per cent, and the indications were that water from this supply could be supplied to the city in 1928.

**KANSAS CITY, MO., WATER WORKS.** Progress was made during the year on the extension to the Kansas City, Mo., water supply system and with contracts let, amounting to \$7,500,000, it was believed that the project would be ready for operation early in 1928. Substantial progress was made on the Missouri River tunnel, which carries the filtered water from the Kansas side under the river to the distributing pumping stations of Kansas City. The Turkey Creek tunnel to the existing Turkey Creek pumping station, and the steel pipe line to the new East Bottoms pumping station, were somewhat less than one-third completed at the end of the year; over one-half of the latter pumping station had been constructed. Up the river the intake and low lift pumping station was one-third complete, and the preliminary and final settling basins were well under way. The filtration and secondary pumping plant was slightly over one-third finished. These structures were located on the Kansas side of the river.

**VANCOUVER, B. C.** A plan for the formation of a metropolitan water board was sanctioned by the taxpayers of the city of Vancouver, B. C., and the municipalities of Point Grey and South Vancouver, and was to be presented to the legislature. It was proposed that the Metropolitan Water Board, when established, would not only purchase the Vancouver City water main system, but it would be given power to spend up to \$10,000,000 for the development of the water supply and the improvement of the existing plants. In place of the submerged pipes under the wide arm of the Pacific Ocean, known as Burrard Inlet, by which the water from the Seymour and Capilano Mountains is brought to the peninsula on which these cities are located, it was proposed to construct a tunnel to carry the pipes, which in 1925 numbered some 15 mains, to prevent the risk of damage due to dragging anchors of ships in the inlet.

An interesting aqueduct or pipe-line made of treated wood staves was built in northern California for the California-Oregon Power Company. This line is 16 feet in inside diameter, and being 2 feet larger than any line of this type hitherto constructed, held the record for the world's largest wood pipe line. It connects two cement-lined tunnels carrying water from the diversion dam to the new plant  $1\frac{1}{2}$  miles below Copco on the Klamath River. It is 1316 feet in length and is composed of Douglas fir staves 4 inches thick, treated with 8 pounds of creosote per cubic foot. The pipe-line is carried in steel cradles and is entirely open to the air. The maximum head of the line is 60 feet

and it has a capacity of 2000 cubic feet of water per second, or more than 100 gallons of water per day for each 12,000,000 persons. The steel cradles and bands require painting from time to time, but otherwise the pipe line is considered fairly permanent, and it indicates the wide use of wood pipe staves treated with creosote which exceeded all expectations. In fact, it was considered possible to use such pipe lines for water supplies as after the free creosote was flushed out no objectionable taste remained. See WATER SUPPLY.

**ARABIA.** A peninsula in southwestern Asia to the south of Syria, Mesopotamia or Irak and the Persian Gulf. Total area, estimated at 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian desert and the Sinaitic peninsula; population, estimated at 4,000,000 to 7,500,000. The divisions of the country of late years have been defined as follows:

(1) **HEJAZ.** The kingdom of the Hedjaz, or Hejaz, was an outgrowth of the World War. During 1925 it was in a very unsettled, not to say precarious condition, with its very life practically in the hands of the Sultan of Nejd. See below. The frontiers are in a state of flux, being actually determined on the west only. The most recent estimate of the area places it at about 150,000 square miles; and estimates of the population vary from 800,000 to 900,000. The population is largely nomadic, although in recent years they have been known to settle in villages where it was possible to cultivate the soil. The principal cities are: Mecca, with a population of from 50,000 to 60,000 (this is the holy city of Islam and attracts about 100,000 pilgrims, annually. These pilgrims represent the chief source of revenue to the government); Medina, also a holy city the seat of Mohammed's tomb, with 15,000 inhabitants; and Jedda, the seaport for Mecca, with about 20,000 inhabitants.

On account of the excessive heat, agriculture is not generally practicable, but in the oases there are large crops, the chief one of which is dates, and in the plateau region wheat, corn, barley, millet, lentils, coffee, and tobacco are raised. The country is famous for its horses, many of which are raised. The chief exports are hides, wool, and gum; and the chief imports, foodstuffs and building materials. Self-government was guaranteed by the British government early in the World War if the revolt against Turkish sovereignty was successful, and on June 5, 1916, the Emir, Hussein ibn Ali, declared its independence. The Hedjaz was recognized as a free and independent state in the treaty with Turkey. Emir at the beginning of 1925, Ali, the eldest son of Hussein, who was forced to abdicate on Oct. 4, 1924.

(2) **SULTANATE OF NEJD.** During 1925 the most powerful state in Arabia. It occupies the highland of central Arabia between the Persian Gulf on the east and Hedjaz on the west. It is ruled by the Saud dynasty, which represents the old Wahabite empire, founded in 1745. The estimated population in 1925 was about 3,000,000. The products of Nejd are dates, wheat, barley, fruit, hides, wool, horses, camels, donkeys, and sheep. Although the export trade is insignificant it is capable of great development, a rapid increase being noted in the trade of horses to Bombay and camels to Egypt. The chief imports into Nejd are piece goods, tea,

coffee, sugar and rice. Reigning Sultan at the beginning of 1925, Abdel-Aziz III ibn Saud.

(3) **JEBEL SHAMMAR.** An emirate north of Nejd and since 1921 an integral part of the Sultanate of Nejd, by which it was captured and annexed. Population, estimated at 250,000. Capital, Hail.

(4) **ASIR.** The principality of Asir lies on the western coast between the Hedjaz and Yemen. Capital, Sabiyah. Estimated population about 1,000,000. The ruler at the beginning of 1925 was Ali ibn Mohammed el-Idrisi. His rule was not extended to the highlands of his country, however.

(5) **IMAMATE OF YEMEN.** Area, about 75,000 square miles; population about 1,000,000; capital, Sanaa with a population of about 25,000. Cereals and coffee are cultivated on a large scale. Ruling Imam at the beginning of 1925, Yahya Mohammed Hamid ed-Din.

(6) **SULTANATE OF KOWEIT.** This territory, subsidized by the British, is on the northwestern coast of the Persian Gulf. Sultan at the beginning of 1925, Ahmed ibn Jabir es-Sobah.

In addition to the above, there are comprised within the limits of Arabia the British protectorate of Aden (q.v.) and the sultanate of Oman (q.v.); also the emirate of Kerak or Transjordan (q.v.).

**HISTORY.** In October, 1924, King Hussein was forced to sign his abdication both as King and Caliph. He was succeeded by his son Ali, who almost immediately evacuated Mecca to avoid bloodshed within its sacred precincts, and set himself actively to raise an army, reorganize the local air forces, and place Jedda in a state of defense against the anticipated attacks of the Wahabis. He received some aid from his brothers in Transjordan and Irak and was also reported to have received planes of British make. An unsuccessful sortie was made in the direction of Mecca in the first month of the year. Following this Sultan Ibn Saud advanced toward Jedda and on January 23 reached the outer defenses of the town. Ali was sufficiently strong to put up a vigorous resistance for some time. In June the government of the Hedjaz announced that it had scored substantial victories over the Wahabis, and had recovered some of the territory that had fallen into the hands of Ibn Saud. On June 20 the siege of Jedda was temporarily abandoned by the Sultan. The unsettled conditions made the annual pilgrimage to Mecca a very hazardous undertaking and as a result the pilgrims numbered only a small percentage in 1925 of those who usually make the visit. The action of the British government in sending a war vessel to the port of Rabegh to "observe conditions" and incidentally to supervise the debarkation of the pilgrims was strongly resented in Moslem circles. In August it was reported that Ibn Saud attacked Medina and that the tomb of Mohammed was badly damaged by the bombardment. Ibn denied this report stating that he had no guns and that he had shown full respect for the holy places. As the year drew to a close the position of Ali became weaker and his abdication was reported.

**ARBITRATION, INTERNATIONAL.** **TACNA-ARICA ARBITRATION.** The Treaty of Ancon of 1884, which put an end to the War of the Pacific between Peru and Chile, stipulated the cession to Chile of the Peruvian Province of Tara-

paca in perpetuity and cession of the provinces of Tacna and Arica for ten years, at the expiration of which a plebiscite was to have been held to determine whether they desired to stay under the control of Chile or to pass again under the sovereignty of Peru. The treaty did not establish the rules and form in which the plebiscite was to be held. When the 10 years had elapsed, the parties could not agree on the terms of the plebiscite. The Chileans insisted upon having control of the voting and on a vote for the Chileans who had taken up residence in the two provinces in recent years, while the Peruvians would not accept either demand, and contended that only the population from Tacna and Arica could vote.

These discussions went on for 27 years, when the situation culminated in Peru breaking off its diplomatic relations with Chile.

At the end of the World War, Peru, which was an "associated Power" again brought up its case and, as soon as the Versailles Treaty was signed, disavowed the Ancon Treaty, citing as a precedent the return to France of Alsace and Lorraine. The case was submitted by Peru to the League of Nations. This was the situation until the Chilean Foreign Minister dispatched a note to the Government of Peru inviting it to participate in a plebiscite as provided in the Treaty of Ancon. Peru suggested that the matter be arbitrated by the United States, which was finally agreed upon.

The Agencies of Chile and Peru presented their cases and counter cases to the arbitrator, the President of the United States, on Nov. 13, 1923, and Apr. 12, 1924, respectively. The arbitrator handed down in March, 1925, a clean-cut decision on the merits of each of the questions submitted. The first question, was decided in favor of Chile's contention that the ultimate disposition of Tacna and Arica should be determined by popular vote. The second question, namely, the conditions of the plebiscite, involved the determination of some important matters, such as the qualification of voters and the supervision of the plebiscite. Some of these matters were decided in accordance with contentions made by Chile, others in accordance with contentions made at one time or another by Peru. The third question, which concerned the northern and southern boundaries of the territory of Tacna and Arica, was decided outright in favor of Peru as far as it concerns the northern boundary. The dispute regarding the southern boundary is remitted to a special commission to be appointed, one member by Chile, one by Peru and one by the United States.

On December 9, the Tacna-Arica Plebiscitary Commission of which General Pershing was the American member, and President, approved the dates fixed by him. Jan. 15, 1926, was named as the day for presentation of the election law. The registration was to be held from February 15 to March 15 and the final votes were to be cast on April 15. Chile's delegates persisted in absenting themselves from the sessions as a protest against the Commission's delay in fixing dates for the voting regulations and for the plebiscite itself. Chile appealed directly to President Coolidge as arbitrator. The two representatives at Arica on December 9, besides General Pershing were Señor Froyre of Peru and Señor Augustin Edwards of Chile. Chile accused General Pershing of delay in fixing a date

for the plebiscite. Peru believed that a fair plebiscite could not be arranged before April 15; and General Pershing on this point agreed with Peru. Whatever delay there had been was due, in the judgment of the American representatives, to obstructions Chile has placed in the path of a fair and free election. The arbitrator supported the position of General Pershing, who had minutely studied for months the situation on the grounds.

**OTHER ARBITRATIONS.** The Tripartite Claims Agreement concluded between the United States, Austria and Hungary on November 26, 1924, came into force on December 12, 1925, by the exchange of ratifications on that date in Washington, D. C. The Mixed Claims Commission of the United States, Austria and Hungary was to take up its functions during 1926.

The German-American Mixed Claims Commission (See YEAR BOOK 1924) had practically concluded its work and the British-American Pecuniary Claims Commission was finishing. Neither the Mexican General or Special Commission had begun to hand down decisions.

Internationally the most important new arbitration outside of Geneva and the Court was the award on delivery in kind under the London agreements. The arbitral board attached to the Reparation Commission has been organized during the year but not worked.

**ARBITRATION AND CONCILIATION.**  
See LABOR ARBITRATION.

**ARCHÆOLOGY.** Early in November, 1925, work was again renewed at the Tomb of Tutankhamen with Howard Carter in charge. The coffin was finally extricated from the nest of shrines which enclosed it and removed to the Tomb of Seti II for investigation. The coffin is of untold value being of solid gold and remarkable workmanship. It is of human shape with painted face, supposed to be a likeness of the young king. The exterior is covered with intricate carvings—inscriptions and figures of divinities. Upon opening the coffin the mummy was revealed adorned with exquisite objects of personal adornment and wearing over the face a golden mask. The mummy could not be removed at first owing to the glutinous mass of gums, spices and wine poured over it during the funeral rites. However, after strengthening the linen wrappings with paraffin the outer layer was split from top to bottom and turned back. Each successive layer was similarly treated and at each stage numbers of beautiful objects were revealed, amulets and pectorals, bracelets and finger rings, also a splendid gold dagger with a crystal handle. On the mummy's feet are golden sandals and on the toes and fingers golden tips.

The coffin required eight men to lift it. No papyri were revealed. Careful examination of the mummy indicated that the young king died at about eighteen years of age.

Two remarkable statues of Akhenaten, the father-in-law of Tutankhamen, have been found at Karnak while work was in progress on a drainage system which was to protect the great temple from the waters of the Nile. The statues are grotesque caricatures of Akhenaten. Previously reliefs of this over realistic type had been found, but these are the first statues to show Akhenaten's passion for truth in art, even to the point of exaggeration. Both statues are of great size. They must have stood ten or more feet in height and were probably mounted on

high pedestals. The elongation of the features would not have appeared so pronounced from this height.

Mr. Walter B. Emery, under the auspices of the University of Liverpool, made important investigations across the Nile from Luxor. Among the private tombs near the Ramesseum at Thebes he discovered two unexplored tombs belonging to ministers of the Pharaohs. They contained excellently preserved painted reliefs and statues. One of the tombs was that of Paheqman, the overseer of the engravers of Thebes, who was doubtless in charge of the gold work done for the Pharaoh.

The French Institute of Archæology at Cairo likewise carried on work at western Thebes under the direction of M. Bruyère. Here at Deir-el-Medineh part of an ancient city was cleared which proved to be the quarter inhabited by painters and sculptors. Perhaps they were the very artisans who decorated the tombs in the Valley of the Kings. The houses were of unbaked brick and among the articles discovered were sculptors' chisels, models, and casts; painters' palettes, and sketches which throw considerable light on the technique of the different arts.

Near by, the cemetery of the artists and scribes was located. The burial chambers are all subterranean and belong to the New Empire. The colors on walls and ceilings are very well preserved, particularly in the case of the tomb of Naktu-Amon, a sculptor of 1550 B.C. Here the artist and his wife are both represented with raised hands, in the attitude of worship. The inscriptions found in the tombs are of great value for they reveal the names and genealogies of the chief painters and sculptors of Egypt.

The Harvard-Boston Expedition working among the pyramids of Giza discovered an important tomb earlier in date than the pyramid of Cheops. The shaft leading to the burial chamber is 150 feet deep. The shaft with its stairway seemed to form a single unit with a temple and a small pyramid of which the foundations alone were preserved. This temple was beneath another temple and one of the three small pyramids to the east of the Great Pyramid. As these latter pyramids belong to members of Cheops' family the indication was that the newly discovered burial shaft belonged to an earlier date. A plain alabaster sarcophagus of rectangular shape was found in the burial chamber. Over this was an inscribed gilt mat giving the complete names and titles of Seneferu. This is not conclusive evidence that the tomb is that of Pharaoh Seneferu as the mat may have been an heirloom or a gift. The date of the tomb is the Fourth Dynasty. Whether the tomb is that of the king or of a member of his family further investigation may reveal.

The French Institute of Oriental Archæology at Cairo has cleared another Egyptian temple about 6 miles from Karnak. The location of the temple was noted as early as the 18th century by an English traveler, as some columns were partly visible at that time. It proves to have been a temple rebuilt by the later Ptolemies of the second and first centuries B.C., and finished by Domitian, Trajan, and Antoninus Pius. The façade has a width of 132 feet which is exactly that of the Temple of Hathor at Denderah. Some inscriptions on the walls date as early as

the 18th and 12th dynasties showing that the later temple is a reconstruction of a much older one.

Excavations carried on at Jerusalem by Rev. J. Garraw Duncan for the Palestine Exploration Fund revealed on the western side of Mt. Ophel a series of rock-cut chambers, with smaller chambers opening off the larger rooms. A similar series of chambers and galleries was also to be seen on the eastern side of Ophel. The date given for them is the Iron Age, not earlier than 1200 B.C. Presumably these rock-cut chambers were royal tombs. There was no evidence that the burial place of David had been found, though it is certainly within the range of possibility.

The expedition of the University of Pennsylvania working at Beisan has discovered the Temple of Ashtaroth in which, according to the Book of Samuel, the Philistines hung up the armor of King Saul after the defeat of the Israelites at Mount Gilboa. An image of the Goddess Ashtaroth was also found as well as her shrine which contained bronze serpents, doves and other cult objects. Beneath the Temple of Ashtaroth which belongs to the Egyptian level and dates from the 19th dynasty a still earlier temple has been discovered, possibly erected by Thothmes III. This contains a large altar approached by a flight of six steps. Finds of beads and jewelry were made, as well as a stone hawk wearing the crown of Upper and Lower Egypt.

C. Leonard Wooley representing the joint expedition of the British Museum and the University of Pennsylvania continued work at Ur of the Chaldees and reported unusually interesting results during the season of 1925. During the early part of the year the excavation of the temple of Nin-Gal, wife of the Moon god was completed. This temple was built in 650 B.C. by Sin-balatsu-ikbi. Beneath this temple were valuable ruins of walls and paved floors of much earlier date. In the western wing of the great court the most important discovery of all was made. Fragments of a stele, or huge slab, 5 feet wide and 15 feet high revealed a series of historical and symbolical scenes arranged in horizontal zones. The author of the stele was Ur-Engur, belonging to the third dynasty and the builder of the famous Ziggurat at Ur. Though the monument is very fragmentary the reliefs illustrate some of the good works of the king. The digging of canals for irrigation is indicated by a scene in which the king stands before the seated figure of a god while from heaven an angel flies down holding in her hands a vase from which water streams out upon the land. This is an entirely new conception and the graceful angel is unique in Mesopotamian art.

The reliefs on three registers of the stele refer to the building of the Ziggurat. The upper scene shows Ur-Engur pouring a libation before the seated figure of the Moon god, Nannar. The same libation is repeated before the Moon god's consort, Nin-Gal. The Moon god holds the builder's implements, pickaxe and measuring rod, indicating that Ur-Engur is commissioned by the god to build for him a house. The second register shows the king bearing the implements as if he would himself take part in the work and below, the actual building of the Ziggurat is represented. The unknown sculptor

of 2300 B.C. who carved this stele was an artist of exceptional ability. This monument has revealed the high state of development to which Mesopotamian art had attained at this early date.

At the request of the government of Iraq Dr. Edward Chiera, of the American School of Oriental Research in Bagdad, conducted excavations at the mount of Yaghlan Tappah, near Kirkuk. This undertaking brought to light a large palace of a private individual in which more than one hundred cuneiform tablets were found. The palace walls were standing to a height of eight or ten feet. Their foundations were of baked brick, but the upper parts were of mud brick. Mud plaster covered the faces of the wall and a coating of bitumen was used around the bottom. In addition the walls were whitewashed. The flat roof was supported by poles and was covered by reeds over which was a layer of clay. The floor of many of the rooms was of mud, but the large courtyard 25 x 30 feet was paved with square bricks. An interesting feature is a dining-room dating from about 1200 B.C. which contains a triclinium of the type associated with Roman times.

Mr. Horsfield, the English architect in charge of conservation work at Jerash, the Gerasa of the Romans, reported some important finds.

While testing the strength of the foundations of the Southern Theatre particularly in the proscenium, the podium of the stage was uncovered. It was found to be intact all the way across with fourteen monolithic columns standing in position. Only the upper portions of these columns were visible previous to this last excavation. The three stage doors were also found in good condition, and the eastern and western entrances to the theatre were cleared. This city, in the mountains of Gilead, about 20 miles east of Jordan was built by the Romans in 65 B.C. and again rebuilt on a larger scale in the second century, from which period the theatre dates. The theatre was constructed to seat about 3000 people and is one of the most complete Roman theatres now in existence.

The Third Asiatic Expedition of the Natural History Museum of New York under the leadership of Roy Chapman Andrews, while not primarily archaeological, yielded material of great value to archaeologists. Mr. Andrews at last found evidence that man inhabited the Mongolian desert at a very early period. Implements of red jasper, chalcedony and chert were found to correspond exactly to the flints of the Azilian Period in western Europe. The evidence points to a much earlier date for the Azilian culture in the Mongolian desert, than in Europe. This helps to confirm Mr. Andrews' contention that primitive man originated in the Mongolian steppes and spread thence to Europe.

Excavations were continued as usual by Sir Arthur Evans at Knossos in Crete. The aim of the season's work was to restore the west wing of the Palace so far as possible. With the aid of fallen columns, sunken blocks, and steps the plan of the Propylæa and central hall was recovered in its essential features.

The South Propylæum of the Palace was also investigated and in digging an exploratory trench near the east wall of this gate a subterranean stone repository was revealed. This was filled with debris and pottery of the M.M.III period. Apparently there was a sac-

risty here belonging to an earlier Propylæum, since the present one dates from the Late Minoan Restoration.

In Greece one of the most sensational archaeological events for the year was the chance find of a bronze statue of a youth, which was hauled up by a fisherman in the Bay of Marathon. The work was in excellent state of preservation as only a small part of one foot and some object held in the left hand, possibly a patera, were missing. The surface of the figure was heavily encrusted when found, due to the action of the salt water, but this was being successfully removed by the Greek authorities at the National Museum of Athens. The statue represents a nude, standing, ephebe, four feet three inches high, with the right arm raised higher than the head which bends slightly forward and to the left. It is of fourth century workmanship and the pose recalls the school of Praxiteles. The discovery was of exceptional value as it supplied an original Greek work of a period too often represented by inferior Roman copies.

The American School at Athens conducted excavations at the Argive Heræum from March 9 to May 9 under the direction of Carl W. Blegen. Exploration above the old temple revealed traces of prehistoric occupation everywhere. Pottery of the Early, Middle and Late Helladic Periods was found and in the Early Helladic stratum were the ruined walls of houses. The foundations were of small stones laid in clay, to support upper walls of crude brick or wattle and daub.

Trial trenches dug on the West Yerogaloro, and East Yerogaloro ridges not far from the Heræum resulted in the discovery of one Early Helladic tomb, nine Middle Helladic graves and thirteen Late Helladic rock-cut chamber tombs of the Mycenaean type. Moreover neolithic remains were also found, in particular, a deposit of polychrome neolithic pottery like the ware of the Thessalian II Period, never before discovered in the Argolid.

The largest of the chamber tombs had a fresco painted around the doorway at the end of the dromos. The design consisted of Mycenaean spiral painted blue-black, yellow, red, and blue. The tombs yielded unusually rich remains; more than two hundred vases were found, as well as bronze swords, spearheads, knives and jewelry. The most valuable objects were two bronze daggers inlaid with gold. The decoration of one consists of a row of three flying birds. The other has a dolphin on either side of the blade.

Dr. T. Leslie Shear supervised the work of the American School at Corinth from March 9 to June 7. Excavations were carried on in the Theatre which he planned to clear completely during subsequent campaigns. The most interesting discovery of the season was a wall covered with painted stucco. This wall was preserved to a height of 1.70 meters rising from the level of the orchestra and followed the circumference of the orchestra circle. It was cleared for a distance of 14 meters and it was probable that a larger amount would be uncovered in the ensuing year. The decoration consists of two gladiatorial combats in each of which two men are engaged with a lion. The figures were life-sized but only the lower portions remain. They are painted against a blue background, and the sand of the arena is suggested by a yellow band

graded from dark to light to indicate perspective. The fresco presumably belongs to the Greek theatre, possibly being destroyed when the theatre was turned into an arena sometime after 46 B.C.

A secondary excavation which yielded surprising results was conducted a mile west of the theatre on the road to Sicyon. Here five rooms of a beautiful Roman villa were uncovered, all paved with extraordinarily fine mosaics in intricate patterns and a variety of colors. In the atrium on each side of the impluvium are mosaic pictures, idyllic in subject. One which is perfectly preserved represents a herdsman standing beneath an olive tree playing a flute, while three contented oxen appear at the right. The pictorial quality of the mosaic is very striking. Landscape is successfully represented and foreshortening is attempted with fairly accurate results. A small room to the southwest of the atrium has a mosaic picture of Dionysus in the centre, surrounded by a pattern in pure design. The central motive of the triclinium is Europa on the bull, while a splendid head of Dionysus wreathed with ivy and fruits forms the central medallion in another room, of which the entire mosaic floor is intact. These mosaics stylistically resemble the third century mosaics at Delos and probably are to be dated before the Roman capture of Corinth in 146 B.C.

The British School of Athens working at Sparta has found on the Acropolis fragments of a life-sized warrior wearing a helmet, with ram's horns carved on the cheek-pieces. The torso and head are well preserved, though the arms are missing. Fragments of the rest of the figure were found including most of the crest of the helmet, the left leg from the knee to the ankle—showing a greave decorated with a pattern of spirals ending in a snake's head—a small portion of the shield, and part of the right foot. The statue is of Parian marble and dates from the first half of the fifth century. It is bearded and has the archaic smile of transitional work. There are resemblances to the pediment sculptures of the Temple of *Ægina*, though the careful working of the back indicates that the warrior at Sparta was a free standing figure. There is no possibility of identification at present, but the pose of the statue would indicate that the warrior is on the defensive and the suggestion has been made that we may have a memorial to Leonidas, the hero of Thermopylæ.

Mr. Woodward excavated in the theatre of Sparta, as well, clearing the stage area, uncovering the *parodos*-walls, and studying the seating arrangements and outer walls of the *cavea*. Four different periods are indicated in the building of the stage of which the earliest may be Hellenistic.

One of the interesting events in Italian archaeological circles was the excavation on the site of the archaic sanctuary of *Girgenti*, situated on the slope of the Rock of *Athena*. The work was superintended by Professor Paolo Orsi and Dr. Pirro Marconi. This ancient shrine was converted into the Norman church of San Biagio in the Middle Ages.

The Temple proves to have been of very early date, erected shortly after the founding of the city by Greeks, in 582 B.C. It is a simple rectangular cella without columns and flanked by *antæ* on either side of a wide doorway.

Decorative elements are scarce, though four waterspouts in the form of lions' heads were found as well as portions of the cornice, painted red and blue, and some of the *cyma* ornamented with leaves and *Mæanders*.

On the north side of the shrine are two round altars, one apparently for blood offerings. Numerous votive vases and lamps were found, of a type especially associated with the chthonic deities, *Demeter* and *Persephone*, to whom the temple appears to have been sacred. The pottery dates anywhere from the second half of the sixth century B.C. to Hellenistic and even Roman times. Two busts of women in terra cotta show the influence of the best fifth century work in Greece. Other female busts also of terra cotta belong early in the same century and are reminiscent of the Maidens in the Acropolis Museum at Athens. One find of exceptional interest is a fragmentary platter of terra cotta decorated, in relief, around the rim with racing chariots and archaic flying victories. Fluted columns at intervals suggest the race course. This interesting example of the potter's art dates from the late sixth or early fifth century.

Every year new villas and other remains of Roman date are unearthed in England. At Ashstead in Surrey important remains of a Roman villa were found by Mr. Anthony Lowther in the course of investigations for the Surrey Archaeological Society and the Crydon Natural History and Scientific Society. The lower portions of interior walls and several rooms with tessellated pavements were excavated. Some of the rooms belong to a bathing establishment centrally heated, by means of tiled flues, from a charcoal furnace. The pavements are formed of square bits of red brick and hard white chalk alternating. The walls were plastered and frescoed. Some were decorated to imitate marble, others with red and black lines or with a rough splashing of red and yellow paint. The windows were found to be of light blue, opaque glass. The date of the villa is the third century.

An ancient boat recently was discovered in Llangorse Lake by T. Jenkins of Llangorse, Breconshire. It is 16 feet long, 2 feet wide, and 18 inches deep, and is hollowed out of an oak tree. The stern comes to a sharp point and the prow ends in a block of solid wood finished with a hook. As there are no oar locks the boat must either have been poled or paddled. It is supposed that the boat was used during the Roman occupation of Great Britain. A Roman camp was situated within ten miles of this lake.

AMERICAN ARCHÆOLOGY. America as well as more distant lands was proving to be a fertile field for archaeologists. For some time the excavation of Pueblo Grande in the Muddy and Virgin River valleys of Nevada had been progressing. This exploration was under the auspices of the Heye Foundation headed by M. R. Harrington. Large adobe houses of prehistoric date with as many as twenty rooms were uncovered. These are arranged about circular courtyards in which were burial mounds filled with skeletons, measuring over seven feet in height. In these mounds were found jewelry carved out of shell, feather robes and pottery. Ceremonial fireplaces occur in the centre of altar-like stages. The city buildings encircle a common centre with a fire altar possibly showing that these Pueblos were sun worshipers. High above the city in the face of the cliffs a salt

*Underwood at Underwood*

ONE SIDE OF STELE

*Underwood at Underwood*

CLAY IDOL

RELICS OF ANCIENT MAYA CIVILIZATION

cave was discovered. Here human and animal bones were found in front of carved altars of salt and sandstone. To the north of Pueblo Grande were unearthed three great stone triangles, possibly the bases for pyramids like those of the Toltec Indians of Mexico. Pictographs near the city show certain characters in common with Toltec, Maya, Egyptian and Chinese writing.

Neill Judd, director of excavations for the National Geographic Society, reported more interesting finds amid the ruins of ancient Pueblo Bonito in New Mexico. A second underground city was disclosed which covers at least three and a quarter acres. Among the dwellings discovered in the pueblo is a building with 800 rooms of which 500 were on the same floor. Some of these dwellings stand four stories high.

The ruined city of Lubaantum is situated in the southwestern part of British Honduras near the Guatemala frontier. The aboriginal inhabitants of Central America developed here the highest civilization known on the American continent previous to its discovery by Europeans. That there is evidence of three different occupations on this site the excavations have made clear. In the spring of 1925 when Dr. Thomas Gann, Reader in Central American Archaeology at the University of Liverpool resumed excavations, the citadel was completely cleared, and a number of small burial-mounds were opened as well.

These burials were in no case older than three or four centuries, and apparently belonged to the latest occupation of the site. The objects found, on the other hand, belonged to widely separated periods of Maya culture. There were spear heads and javelin heads of flint and obsidian, beads, pendants of shell, pottery vessels, etc. Clay figurines were common and of extraordinary interest, as they show the headdress and the costumes of the people. One representing a tiger god is almost an exact duplicate of a sculpture on an altar at Copan. This is typical of the Maya Old Empire style. The citadel with an area of seven to eight acres is pear-shaped and is elevated about 40 feet above the ground level. The sides are faced with cut stone blocks and cement. On top are a number of stone-faced, stepped pyramids and, most remarkable of all, at the broad end of the citadel is an amphitheatre capable of accommodating from 5000 to 10,000 spectators. The whole area was excavated from the midst of a dense forest.

A royal tomb of the Mound Builders was discovered on September 11 in the Pricer mound, near Bainbridge, Ohio. Four bodies were found, wrapped in strands of pearls of extraordinary size and perfection, and surrounded by jewelry of copper, silver and tortoise shell. Two of them wore copper helmets. This was undoubtedly the richest burial yet found in North America. Four effigy pipes were also uncovered. Two of considerable size were carved in the shape of a wolf and a bear respectively. Both were highly polished. Apparently it was customary to bury the important dead in heavy-timbered mausoleums. The bodies were placed on a platform which was covered by a canopy of cloth. The imprint of this fabric could be seen on the ceiling, and one small fragment of cloth with geometric patterns was actually preserved. Apparently after burial earth was piled over the sepulchre in the form of a mound, much

as in prehistoric burials of Greece or Etruria. **ARCHITECTURAL LEAGUE.** See ART EXHIBITIONS.

**ARCHITECTURE, UNITED STATES.** 1925 was a year of unprecedented construction activity. Its total value was estimated by the F. W. Dodge Corporation (quoted in the *Architectural Record*, January, 1926) as \$6,500,000,000, which may be compared with \$5,237,000,000 for 1924. Of this amount \$2,382,000,000 was estimated as the value of residential building, \$834,000,000 for commercial building, \$620,000,000 for industrial building, and \$423,000,000 for educational building. Despite the enormous value of residential work, the housing shortage in medium and low priced city buildings still continued; for the year 1925 was characterized especially by the enormous wealth that had been invested in lavish apartments, hotels, and large houses, and, by comparison, an almost total lack of construction of housing for the poorer people, whether in New York, in Chicago, or in Florida. This movement had gone to such extremes that some of the large insurance companies have been compelled, towards the end of the year, to stop making loans for this type of construction.

The architectural results of this enormous expenditure were almost nil. No new ideas in planning or in style treatment appeared. It was economy of construction costs to give the largest possible percentage of income that had everywhere controlled design; and this control, while developing cleverness in compact planning, and leading to all sorts of mechanical space-saving devices—in-a-door beds, kitchenettes, folding dining tables, etc.—led, in architectural treatment, only to stinting of expenditure combined with cheap lavishness, often tawdry, to attract the tenant. The architect of such a project, often working on cut-throat cut rates, still more often untrained, or without vision, was not in a position to produce originality, and beauty is considered simply for its advertising value. No such psychology can produce great architecture—good design is an accident; beauty a work of supererogation.

In city apartments there was a continuance of Italian tradition in the larger examples, and of Georgian in the smaller. In the main, individuality was totally lacking. They all had the same hall-mark, both outside and in, a rather obvious and lavish luxury. In Florida, whose development during the year was almost miraculous, the so-called Spanish type of house had been almost universal, but treated in a manner much more frivolous than in California. Again, as in the city apartments, it was the obvious advertising quality that dominated; stucco of mottled color, extravagant detail, overemphasized artificial crudities.

There were, of course, commendable exceptions to these indictments. Parker, Thomas and Rice produced some simple, straightforward small apartments in both Boston and Baltimore. Hentz, Reid and Adler did good investment buildings in Georgia and Florida. Beekman Terrace, by Treanor and Fatio with J. E. R. Carpenter as consultant, rose interestingly and with a distinct individuality from the East River bank in New York. Raymond Hood's designs for a block of houses in Coral Gables, Florida—based on French precedent—had a restraint and delicacy unusual in the recent work in that boom State. Bates and How had done suburban apartments near

New York of real charm, and in New York, Andrew J. Thomas continued his usual high standard.

There was one apartment still under construction in New York City that was unique because it was the first apartment distinctly and primarily a sky scraper—the Ritz Tower, thirty-five stories high—by Emory Roth. In general form it makes excellent use of the set-backs the law requires, and its silhouette was soaring and graceful. The details, however, lacked the distinction of the general conception: they show clearly the innate difficulties of scale and size that inevitably result from the attempt to treat a form so modern in a style purely archæological.

Two club buildings in California at least partly residential, deserve notice: the Women's Athletic Club, at Los Angeles, by Alinson and Alinson, interesting in its picturesque planning for a city lot and its style freedom, its garden court and loggia over the ground floor shops, its lovely swimming pool—all superior to its rather commonplace exterior; and the Elks Club at Sacramento, by Leonard F. Sparks and Co., E. F. Flanders associated, which, like the Ritz Tower, shows strongly the influence of modern skyscraper design, and has a daring successful silhouette, with detail somewhat Georgian in character, romantic, but occasionally sentimental.

In the great quantities of commercial and industrial work, the American mastery of skyscraper design, based on a realization of the importance of its form composition, seemed growing. In New York the building of the Equitable Life Assurance Society, by Starret and Van Vleck shows a simple and dignified set-back treatment with a style freely Renaissance; Cass Gilbert's design for the New York Life Insurance Co. on the site of the old Madison Square Garden uses a heavy and rather monotonous classic, and shows an unfortunate incoherence in the relation of the main building and its tower.

In Kansas City, the Kansas City Life Insurance Co. completed a lavish and monumental building in Greek Doric, by Wight and Wight. All of these are in a conservative and traditional manner. Much more original, much more truly creative, was the new building for the Farmers' Loan and Trust Co., New York, by Starrett and Van Vleck, in which a bold set-back composition is treated with detail generally Byzantine but refreshingly free; the Barclay-Vesey Telephone Building, New York, by McKenzie, Voorhees and Gmelin, with a daring power of mass composition that is extremely effective, and a free use of the emphasized vertical line with touches of strong figure sculpture; the Everson Building in Philadelphia, by Rankin, Kellogg and Crane; the San Francisco Chronicle Building in San Francisco, by Weeks and Day, with a richly decorated corner treatment whose gothic character seems forced; the Pacific Gas and Electric Building, San Francisco, by Bakewell and Brown, that, despite its classic details, uses *baroque* motives to break the skyline in a modern way; the Bradley Building, Chicago, by Fugard and Knapp, with an interesting set-back composition; and the Tribune Building, Chicago, by J. M. Howells and Raymond Hood, whose completion marks the final realization of the idea that produced the famous competition two years ago. In this building, despite certain awkwardness of scale around the main entrance, despite an occasional over-elaboration, the composition is so

direct, and sure, the ornament of such a free and modern gothic, that the whole is bound to be an important monument in the history of American architecture.

In buildings of a public nature there was less to mention, and what there was generally approximated to the usual American classic tradition. In San Francisco the Palace of the Legion of Honor, by George A. Applegarth, is a building of perfect academic quality, a little cold, hard, bookish; effective, and not quite human. The Medal of Honor for Monumental and Governmental Buildings of the American Institute of Architects was awarded to E. L. Tilton and A. M. Githens, for the Public Library of Wilmington, Delaware, a design of marked originality, a logical expression of its plan, with detail of free Greek inspiration. The Maryland War Memorial at Baltimore, by Lawrence Hall Fowler, has a monumental auditorium and a beautiful trophy hall below, inside an exterior dignified but rather harsh, with a colonnade whose attachment to the main mass of the building seems unstudied. The whole, however, is coherent, strong, dignified, with more of life and personality than many such classic designs display.

The design of Paul Cret and Marcellus E. Wright for the Virginia War Memorial at Richmond is, on the contrary, modernist in type, and yet even more harsh and uncompromising than the other. The competition for the Roosevelt Memorial in New York was won by John Russell Pope with a design of impersonal, lifeless, classic, academic perfection. Another, for the School of Business of Harvard University was won by McKim, Mead and White, with a design whose plan showed that greatness which results from a perfect grasp of the site and the problem. Charles A. Platt has published a design for the National Gallery of Art in Washington which shows a style dominantly classic in a rather heavy English vein treated with unusual distinction.

The Guild Theatre in New York, by C. Howard Crane, Kenneth Franzheim, and C. H. Bettis, marks a distinct advance in theatre planning; the arrangement of stairs and lobbies is particularly original, open and attractive. Its detail is less interesting throughout. The theatre interior itself is noteworthy for the simplicity of the wall treatment and the elimination of a decorated proscenium arch; the stage opening is the entire end of the auditorium, a scheme the interest of which deserved better than the rather ordinary Renaissance ornament used in the decoration. The Roosevelt Theatre in Chicago, by C. Howard Crane and Kenneth Franzheim, is notable for its size. The Community Play House at Pasadena, by Elmer Gray, uses beautifully the modified Spanish Renaissance style for which its architect is noted; it is simple, inviting, lovely.

The year saw less notable religious building. The Tifereth Israel Temple in Cleveland, Ohio, by Charles R. Greco, has an interesting dome, and its style is a modern mixture of Byzantine and Moslem. The Church of St. John of Nepomuk, New York, by John V. Van Pelt is an ambitious attempt at eclectic Romanesque, particularly successful in its exterior texture. The most important fact in the ecclesiastical architecture of 1925 was the great drive for a building fund for the New York Protestant Episcopal Cathedral of St. John the Divine, and the be-

NEW YORK CITY

ginning of the actual construction of the colossal nave, designed by Cram and Ferguson. Their design, based on a six part vault, with alternate light and heavy piers, and high side aisles, is marked by the remarkably varied perspective effects it produces, and its beautiful utilization of the magnificent opportunity of its great size.

The combined exhibition of the American Institute of Architects and the Architectural League of New York, held in conjunction with the Institute Convention in April, containing, as it did, exhibits from all over the country, furnished an unusual opportunity to judge the style trend of American architecture as a whole. Two things were apparent; first the unification of architecture all over the country, due to the country-wide distribution of art periodicals, and the country-wide advertising and distribution of building materials; and second a slow but perceptible progress towards an increasing style freedom. To be sure, there were still buildings like the Stock Yard National Bank in Chicago, in which A. Epstein copied laboriously Independence Hall in Philadelphia in a site and for a use utterly unsuitable; there is the uninspired school classic of the winning design for the New York Roosevelt Memorial. Yet these are exceptions.

Everywhere architects seemed to be seeking freedom for their creative impulses, alike from historic style or from antipathy to historic style. Particularly in city building this progress was notable. It is not always successful; in the Bismark Hotel, Chicago, C. W. and George L. Rapp, in their attempt to treat a skeleton structure logically, by imposing on its walls a surface pattern, have fallen into incoherence like so many of the German attempts at the same problem. Yet even in this building the endeavor was clear, the development in the right direction. And, when one looked at the fine mass of the proposed Los Angeles City Hall by John C. Austin, Albert C. Martin, and John Parkinson, or the great Barclay-Vesey Telephone Building, by McKenzie, Voorhees, and Gmelin, or the Tribune Tower in Chicago, by John M. Howells and Raymond M. Hood—and many other examples might be cited—when one realized the meaning of the award of the A. I. A. medal for commercial buildings to Arthur Loomis Harmon for the magnificent mass of the Shelton—the conclusion was inevitable that more and more in American architecture it was mass composition, it was dramatic conception that was the important element, and that style was secondary.

In this development an important factor was the wide publication of drawings by Hugh Ferriss, not himself a designer of buildings, but a portrayer of dreams. A master of chiaroscuro, with an imagination vivid and alert, his compelling drawings of towering buildings, of romantically yet carefully massed cities in which architecture has at last become the master of all the skill of the engineer, have done not a little to point the way of the future development of American architecture.

EUROPE. The main architectural interest of Europe during the year of 1925 was the Exposition des Arts Decoratifs in Paris, to which the United States, unfortunately, sent no exhibit. It brought to one centre all the increasing radicalism that had been such a marked feature of the architecture and decoration of recent continental Europe. Setting out to be a frankly

temporary group, it sought to make of this very quality an opportunity for decorative effect. Everything was subordinated to lightness, brilliance, the bizarre. The desire seems to have been consciously to shock, to stimulate, to excite rather than to rest or permanently satisfy. Unbridled originality was given the fullest sweep, occasionally with deplorable results, like the wooden "trees" by Mallet-Stevens, or the sharp thin angularities of the misnamed Bassin des Nymphes, by A. Laprade, but sometimes also with results that have a fairy quality of fantastic romance, like the four restaurant towers of Charles Plumet, instinct with a sort of fresh pseudo-orientalism, a fantastic cubist Arabian Nights Entertainment.

This plan of course produced certain incoherences wherever the modernism of the Exposition came into contact with the suave charm of an earlier Paris. The lovely bridge of Alexandre III was unhappy with its angular garlands of building. The great Porte d'Honneur, by H. Favier and A. Ventre—a powerful composition of rising curved masses—seemed ill at ease beside the lavish classic of the Grand Palais. And within the Grand Palais was a hall, by M. Sue, with Jaulmes as decorator, which seemed, though bizarrely effective in itself, strange within the classic entrance.

Of the French architecture in the Exposition the minor buildings were almost always more successful than the major, despite the effectiveness of the Pavillon de la Ville de Paris, by Roger Bouvard, and the *baroque* bravura of the Pavillon des galeries Lafayette, by J. Hiriart, H. Tribout, and G. Beau. Of the minor buildings, especially noteworthy were the Auberge de la Potée Lorraine, by P. Selmersheim and the Monument Funeraire by Roux Spitz, both in the French Village; the Pavillon du Gant, by P. Selmersheim; the Boutique de la Maison Viacroze, by Guerbois and Dambrun; and the Pavillon des Alpes Maritimes, with its garden, by Charles and M. Delmas, with André Rioussé as landscape architect.

French architecture, outside the exposition, shows less of interest. The style situation was still chaotic, and in permanent buildings modernism had reached no such mastery as in those of the exposition. Typical of permanent work in a modern style was the Clinique de Landez, by L. Brachet, a hospital whose detail is brutally heavy. The Maison du rapport on the Boulevard Raspail at Paris by H. Sauvage, achieved in its search for originality only incoherent chaos. A similar incoherence characterizes the apartment on Cours Albert Ier, by Forest and L. Nibodeau, which is lovely up to the cornice and confused above. Far better was the Bureaux de Postes in Paris by P. Figard, which makes up for lack of composition by lovely restrained vertical reeded pilasters. The New Moulin Rouge, by Thiers, Forest, and L. Nibodeau, is a good example of a lavish modern theatre.

The Hotel de l'Intransigeant at Paris by P. Sardou was in a different class. Here there is novelty, but restraint; a sense of the classic past as well as of the industrial present. The great hall was especially interesting, with its simplified Greek Doric columns, its stained glass, and the scrolled iron gates by Edgar Brandt. Equally unusual, and a most effective and beautiful conception—serious, restrained, deeply emo-

tional—is the remarkable design of Roux Spitz or a monument to the Heroes of Dixmude, in which great masses of masonry grow out of enormous, solemn buttresses that suggest wings without imitating them. It is a masterly combination of symbolism and power.

**GREAT BRITAIN.** At the Paris Exposition, the heavy, erratic British Building by Easton and Robertson, revealed that the British designer does not take readily to this type of modernism. Its contrast with such restrained work, freely traditional, as Ashburne Hall, in the University of Manchester, by Thomas Worthington and Sons, makes this clear. The new college buildings at Bristol by Oatley and Lawrence were also extremely interesting, especially the great hall and tower. Strictly archaeological but beautiful in the care with which they are done and the feeling in their design are the interiors of Ironmongers' Hall, by Sydney Tatchell, F. R. I. B. A.

Typical of the more eclectic types of English design were Adelaide House, London, by Sir John Burnet, A. R. A. and partners, Britannic House, London, by Sir Edwin Lutyens R. A. (awarded the Gold Medal by the American Institute of Architects at its April convention) both in the best restrained modern English classic based more on Roman than on Georgian precedent; St. George's House in London, by Sir John Verity, F. R. I. B. A. and the new building for Spiller's Industries Ltd. by Sir Edwin Cooper; the last a charming piece of refined modern classic, to which the tradition of the *néo-Grec*, Louis XVI, and Adam have all contributed. Vigo House, London, by Williams and Cox, F. R. I. B. A., was a daring but unsuccessful attempt to combine *art nouveau* and classic; much too incoherent.

As usual, the English architects continued to produce much smaller work of exceptionally high character. This year houses by Robert Atkinson and Nichol and Hughes are especially noteworthy. The year marked the completion and opening of the first section of Liverpool Cathedral.

It is a bold attempt to revitalize the Gothic tradition; large in scale, dignified, a little sombre, in some details a little heavy. The *rededos* seems too small for its position; yet the effect of the whole is inspiring.

**GERMANY.** In Germany the modernist movement seemed at last definitely established; as it develops it grows in refinement, simplicity, and restraint. The building that is dominated by a past tradition (like the attractive "Georgian" houses of Heilman and Littman of Munich) was a distinct exception. The new style aims generally at simple rectangular compositions with high pitched slate roofs. It is a style eminently fitted for its climate and situation, and does not conflict with the older buildings; it "belongs." Typical of the simpler buildings in this style are the houses of Albert Eitel, of Stuttgart, or of Paul Bonatz, and of the more monumental buildings, the Verner Alfred Bad in Potsdam, by Prof. Paul Baumgarten, a church in Wittesheim, by Michael Kurz, and the great Hanover Crematorium, by Konrad Wittner. The German Travel Exhibition in Munich was remarkable for its frank expression of the temporary character and the beautiful simple use of exposed timbering. The entertainment buildings, by Prof.

O. O. Kurz, the great simple wooden "Blinkturm"—lighthouse—by Lechner, Norkauer and Harbers, and the Luftfahrhalle, by Prof. R. Riemerschmidt were especially direct and lovely.

**AUSTRIA.** Austria had the honor of producing one of the loveliest of all the national buildings at the Exposition des arts decoratifs at Paris, designed by Joseph Hoffman. Its horizontally molded walls were extremely interesting, but its most charming feature was its greenhouse, by Prof. Peter Behrens, with glazing bars made into a most interesting pattern like a Chinese grill. Austria had also produced recently some of the most pleasing housing developments in the world, for the official Wiener Stadtbauamt, in the Viennese suburbs. The development of Hermesweise, by Karl Ehn, and that on the Spallartgasse, by Erich Leischner were typical, but the most interesting were the developments of Fuchsenfeldhof, by Heinrich Smid and Herman Aichmeyer, especially noteworthy for its lovely picturesqueness; and that on the Quarinplatz by Prof. S. Theizs and Hans Jaksch with lovely free brickwork. These developments in Vienna were perhaps the most advanced and architecturally successful attempts at large scale, low cost urban housing that had yet been produced.

**ITALY.** The renewed prosperity of Italy found expression in much building in which the ideals of Fascism—a reverence for the Roman Empire, a theatricalism that was Baroque, and a "secessionism" that was modern—found almost constant expression. The Italian building at the Paris Exposition, by Brasini, was typical; a heavy modernism superimposed upon gigantic Roman details. In the interior, where less attempt to astonish was made, contrasts of rich and plain produced considerable charm. Typical also was a Café Restaurant at Milan, by R. Gaetani, with its soda fountain erected into a shrine and the whole decorated with an overpowering richness. The Tennis Club at Milan by Muzio, with obvious borrowings from American ideas, expressed the new Italian interest in sports. Much more simple and direct are the model tenements in Milan in the Tiepolo and Pascoli quarters, by G. Broglio, distinguished for their clever and economical plans and their interesting baroque character.

**OTHER COUNTRIES.** Russia appeared again in the architectural world with the Pavillon of the Soviets at the Paris Exposition, by Melnikoff, a strangely interesting building of hard rectangular lines; the Cinema Picadilly, in Petrograd, by Ahnedingen, an amusing theatre of rather *art nouveau* character, and some interesting studies for workmen's houses in Moscow, by various architects. Switzerland showed vital and interesting work by Otto Zollinger, at Saarbrücken and Zurich, with a character somewhat similar to that of Hoffman in Vienna. The Polish building at the Exposition in Paris, by Joseph Czajkowski, was crude, ostentatious, incoherent, though with interesting geometric iron work in its ugly spire. Holland continued to produce extremely interesting housing work in the most radical modernist style, in which brick was beautifully used to determine forms as well as texture. Apartments and dwellings by P. Kramer and M. de Klerk were typical. There was also completed a great Post Office Building

OFFICIAL OPENING OF THE EXPOSITION

EXPOSITION DES ARTS DECORATIFS, PARIS

in Utrecht, by J. Crouwel, Jr., that was magnificently planned. The main public hall was effective and beautiful, with great brick arched ribs of interesting hyperbolic shape.

It was obvious from all of these examples that in Europe the development of a new style was proceeding swiftly; the movement towards a more free and direct feeling for form composition could be accepted as definitely established.

**ARCTIC REGIONS.** See POLAR RESEARCH.  
**ARGEMONO OIL.** See CHEMISTRY, under *Organic Chemistry*.

**ARGENTINA**, ár-jén-tá'ná. A South American Republic on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories and the federal district. Capital, Buenos Aires.

**AREA AND POPULATION.** The total area of Argentina is 1,153,119 square miles. The population on Jan. 1, 1924, was 9,548,092, as compared with 7,885,237 at the last census year, 1914. The movement of population in 1920 was: Births, 276,800; deaths, 129,600. The number of immigrants in 1924 was estimated at 160,127 and the number of emigrants in 1923 at 76,520. Immigration and emigration usually balance because of the influx and exodus of large numbers of Italian and Spanish laborers before and after the harvests. The population of the larger cities was as follows: Buenos Aires, June 1, 1914, 1,575,813 and according to the census of Jan. 1, 1924, 1,811,475; Rosario (Sante Fé), 1914, 222,592 (estimated December, 1923, 265,000); Córdoba, 1914, 134,935 (estimated December, 1923, 156,000); La Plata, 1914, 90,436 (estimated, 1923, 151,000); Tucumán, 1914, 91,216; Santa Fé, 1914, 59,974; Mendoza, 1914, 58,790; Avellaneda, 46,277 (estimated in 1919, 105,000), and Bahía Blanca, 1914, 44,113.

**EDUCATION.** Elementary school education is free, secular, and compulsory for children from 6 to 14 years of age. In 1922, there were 9940 primary public schools, with 40,169 teachers and 1,227,400 pupils. During 1923 there were in the entire country 174 secondary, normal, and special schools under the Ministry of Public Instruction, divided as follows: 40 national secondary schools, one secondary school for girls, 84 normal schools, 6 commercial schools, 3 industrial schools, 15 vocational schools, 1 school of mining and chemical industries, 16 women's vocational schools, 1 institute of pedagogy, 1 institute for teachers of modern languages, 2 deaf mute schools; 1 institute for the blind, and a national academy of fine arts and a school of fine arts. The registration of pupils in these schools amounted to 73,296, of whom 31,396 were boys and 41,900 girls; the average attendance was 64,900. Ninety-six per cent were Argentines and the rest foreigners. The teachers in these schools numbered 6366. There were also 188 private schools with 9345 pupils. For higher education there are the following national universities with their enrollment in 1923: National University of Buenos Aires, 9518; Córdoba, 1977; University of the Littoral, 2115; Tucumán, 92; La Plata, 1464.

**PRODUCTION.** The main occupations in Argentina are stock raising and agriculture. About 500,000,000 acres are devoted to these two pursuits, being about equally divided between the two. The accompanying table from the *States-*

*man's Year Book* for 1925 shows the acreage and yield of the principal crops for the crop years, 1922-23 and 1923-24.

	Acreage		Produce (Metric tons)	
	1922-23	1923-24	1922-23	1923-24
Wheat ...	17,237,500	17,317,107	5,145,081	7,057,949
Oats ....	2,662,500	2,779,437	797,967	1,190,758
Maize ...	7,942,887	8,563,600	3,890,000	5,744,403
Flax ....	4,880,000	5,316,365	1,124,769	1,606,398

In his message read before Congress on May 14, 1925, the president gave the following statistics on the export of the various grains during the years 1923 and 1924:

Grains	1923	1924	Percent- age of in- crease
	Metric tons	Metric tons	
Wheat .....	3,721,875	4,423,709	8.8
Linseed .....	1,085,788	1,472,251	42.1
Oats .....	458,453	719,608	56.9
Barley .....	62,233	182,855	198.8
Cotton .....	2,859,215	4,561,157	59.5
Maize .....	3,452	7,492	117.0

Besides grain, cotton, and sugar, the vine and tobacco are also cultivated. The area under sugar is approximately 237,500 acres and the quantity of manufactured sugar in 1923 was stated at 256,904 tons. The area under the vine was about 280,000 acres and the number of gallons of wine produced in 1923 was 119,688,052 gallons. The area under tobacco in 1924 was 22,060 acres and under cotton 150,000 acres. Sixteen thousand tons of cotton were produced in 1923. According to the latest official livestock census (1922) there were 37,064,850 cattle; 30,671,841 sheep, and 1,436,368 hogs. The United States Bureau of Foreign and Domestic Commerce reported that throughout 1925 agricultural and economic conditions were generally favorable in Argentina. The first official forecast of the area sown to cereals and linseed for the 1925-26 season, as issued by the Argentine Department of Rural Economy and Statistics was given in hectares as follows: Wheat, 7,620,000; linseed, 2,311,000; oats, 1,190,000; barley, 330,000; rye, 180,000; birdseed, 27,500. The acreage sown represents increases of from 4.3 per cent in the case of barley, to 20.5 per cent in the case of birdseed. Linseed acreage decreased 9.7 per cent. The following increases were noted for other important cereals: Wheat, 5.8 per cent; oats, 11.1 per cent; rye, 15.4 per cent. During 1925 the government was continuing its intensive efforts to promote the oil industry.

The Minister of Agriculture outlined the plans for 1925 as follows: "The financial estimate for 1924 was based on an output of petroleum and manufactured products of an estimated value of 16,233,140 pesos, national currency. As a matter of fact the amount produced was worth 19,332,858 pesos, including sales and reserves, or an increase of 19.10 per cent over the estimate. In 1925 the second year's programme of the four-year development plan as approved by presidential decree of Dec. 31, 1923, was to be carried out. This included in Comodoro Rivadavia the drilling of 100 wells for exploitation and 8 for exploration, besides 48 wells which should have

been drilled in 1924, or the drilling of 156 wells in all by the end of 1925."

COMMERCE. According to the United States Bureau of Foreign and Domestic Commerce, Argentina had a favorable balance of trade during 1924, following unfavorable balances for the years 1921, 1922, and 1923. In 1924, the actual value of Argentine foreign trade amounted to 1,840,104,575 gold pesos, or an increase of slightly more than 12 per cent over 1923, according to official statistics contained in the *Review of the River Plate*, April 3, 1925. Imports for the year decreased 4.6 per cent as compared with 1923, but exports increased 31.1 per cent over the same period. The actual balance of trade in favor of the country in 1924 was 182,684,589 gold pesos as compared with an unfavorable balance of 97,068,834 gold pesos for the previous year. The real value of the imports for the year amounted to 828,709,993 gold pesos, of which amount 30.3 per cent were duty free, as compared with 22 per cent for 1923.

Customs receipts in respect of import duties, which amounted to 112,856,822 gold pesos for 1924, represent 13.6 per cent of the total value of the imports. Applying these duties exclusively to the value of the dutiable imports, they represent a charge of 19.5 per cent. Prices of imports, which experienced a progressive increase until 1918, in comparison with the "nominal values" of the tariff of 1906, have declined steadily to and including 1924, the difference in that year between nominal and real values being 118 per cent. Taking 100 as the basis for real prices in 1910, the price-measuring index number in 1923 was 218.8 per cent, and 210.2 per cent in 1924, or a decrease of 8.6 units in relation to 1923.

The total value of the exports in 1924 was 1,011,394,582 gold pesos, as against 771,361,262 gold pesos in 1923, or a gain of 31.1 per cent. Exports subject to customs duties amounted in 1924 to 662,874,877 gold pesos, while 348,519,705 gold pesos were duty free. The value of duty-free exports represent 34.3 per cent of the total, as compared with 30.2 per cent for 1923. The value of the exports in 1924 was one of the highest hitherto recorded, having been exceeded only by the figure for 1919 and 1920, in which years they amounted to 1,030,000,000 and 1,044,000,000 gold pesos, respectively. The value of livestock products exported in 1924 amounted to 406,185,000 gold pesos, and gained by 25.4 per cent over 1923.

Agricultural products to the value of 571,965,000 gold pesos were exported, the increase in this item being 38.2 per cent. The total quantity of all products exported in 1924 amounted to 14,400,000 tons—an increase of 31.6 per cent over 1923. Of this increase, 18.2 per cent pertains to livestock products, and 38.1 per cent to agricultural products. The greatest increase in livestock products was in meat. In 1923, 739,000 tons of meat, valued at 121,865,000 gold pesos, were exported, and in 1924, 953,000 tons, valued at 166,772,000 gold pesos. The increase in quantity represents 28.9 per cent and the increase in value 36.8 per cent. Meat exports in 1924—953,000 tons—are the highest in any one annual period. The exportation of salted hides showed an important increase in 1924. Shipments were 169,000 tons, or 36.8 per cent more than in 1923, their value being 62,087,000 gold pesos, or 41.3 per cent in excess of the previous

year. Unwashed wool exports declined, the 1924 shipments being 113,200 tons, as against 131,600 for 1923. The higher price of wool in 1924, however, increased the value of the exports, the figures being 69,493,000 and 58,695,000 gold pesos for 1924 and 1923, respectively. The average price of wool in 1924 was 613.52 gold pesos per ton, as compared with 445.96 gold pesos for 1923.

In agricultural products, the most important increases were in the exports of wheat from 3,722,000 to 4,384,000 tons, or 18 per cent; wheat flour, from 82,000 to 175,000 tons, or 113 per cent; bran and pollards, from 192,000 to 253,000 tons, or 31 per cent; maize, from 2,859,000 to 4,527,000 tons, or 58 per cent; linseed, from 1,036,000 to 1,358,000 tons, or 31 per cent; oats, from 458,000 to 729,000 tons, or 59 per cent; barley, from 62,000 to 192,000 tons, or 209 per cent. It is to the increases in quantities just stated that are due the increases in values, prices having exercised but little influence, as the market quotations for the products specified showed little variation either way between 1923 and 1924. Customs and port revenues recorded a substantial gain over 1923. Import duties represented 13.6 of the total real value of the imports in 1924, while export duties formed 1.7 per cent of the total value of exports.

The total commercial value of Argentina's foreign trade during the first six months of 1925 amounted to 936,058,341 gold pesos, according to the report of the Director-General of Statistics. This amount represents a decrease of 4.6 per cent from the corresponding period in 1924. Imports amounting to 438,373,857 gold pesos, showed a gain of 6.3 over 1924. Exports, valued at 497,684,484 gold pesos, showed a decrease of 12.7 per cent. The favorable balance of trade for the half-year period is given at 59,310,627 gold pesos, or 62.3 per cent less than 1924. The reduction in the favorable balance of trade is attributed to the decline in agricultural exports and to increased imports.

FINANCE. The accompanying table from the *Statesman's Year Book* for 1925 shows the main items for revenue and expenditure in the budget for the year 1925 (paper peso = \$.04246 at par);

Revenue	Dollars paper
Import duties .....	200,250,000
Export duties .....	35,000,000

The external debt on Dec. 31, 1923, was 544,867,101 paper pesos; internal debt, 776,567,289 paper pesos; making a total of 1,321,434,390 paper pesos. On June 30, 1924, the floating debt was 813,334,270 paper pesos. At the beginning

of the year a \$25,000,000 loan was underwritten by a New York City syndicate for the Argentine government. Two issues of six months  $4\frac{1}{4}$  per cent treasury notes were offered at par. The proceeds of the sale were used to retire an equal amount of notes which matured on February 25 and March 1. In February a severe money stringency occurred, due to the increase in wheat prices due to Argentine farmers holding wheat for higher values and the refusal of foreign countries to buy when prices advanced. To meet the situation the government organized a branch of its Bank of Emission in New York City, to receive deposits, against which national currency could be issued.

**COMMUNICATIONS.** No later statistics are available than those given in the preceding YEAR Book for shipping. In the autumn, the Director of Navigation and Ports in a report to the Ministry of Public Works stated that the statistics of the Argentine ports showed that the revenues from that source had increased from 42,370,258.65 pesos in 1922 to 54,542,739.35 pesos in 1924, of which 43,612,722.18 pesos were turned into the general revenues, and 19,200,981.68 pesos spent for port services, leaving a surplus of 24,411,790.50 pesos. Up to December 31, 1924, the government had spent on the navigation system and commercial and military ports 474,257,023.92 pesos, from which it received a net profit of 24,411,791 pesos in 1924; that is, sufficient to pay the interest of 8.57 per cent on the debt contracted for building them and also to permit the investment in new public port works.

The railway lines of Argentina comprise a total length of about 22,200 miles, of which the British proportion is about 65 per cent, with the national lines accounting for about 20 per cent. The remainder are controlled by French interests. The total capital employed in all these various lines is estimated at \$1,346,537,815. It was announced during the year that the electrified suburban lines of the Central Argentine around Buenos Aires were to be extended from Retiro Station in that city to Villa Ballester ( $12\frac{1}{2}$  miles) and from Belgrano Station to Tigre (8 miles), at an approximate cost of £1,000,000.

During the year 1925 there was considerable extension of the railway systems of Argentina, so that at the end of the year the length of the railway lines under national jurisdiction was actually 35,805 kilometers (22,234 miles). According to a special summary furnished in the annual statistical number of the *Railway Age* (New York), the sections opened up during the year were as follows: On the Rosario extension from Lerma to Socompa up to kilometer 71; on the Embarcacacion extension to Yacuiba up to kilometer 88; on the Metan extension to Barranqueras up to kilometer 65; on the Antilla extension up to Rosario de la Frontera; on the Catamarca extension to Tucumán up to kilometer 41; on the San Juan extension to Jachal up to kilometer 24; on the Patagones extension to San Antonio up to kilometer 188; on the 448 kilometer extension to Lake Nahuel Huapi up to kilometer 115; and on the Puerto Madryn extension to Colonia, up to kilometer 151. During the year the Argentine railways had successful business and various improvements were being added. New rolling stock was provided and a classification of the traffic personnel in many

departments was brought about with but a single strike, which took place in January on the Entre Rios and the Argentine Northeastern.

**GOVERNMENT.** Executive power is vested in a president elected for six years, and legislative power in a national congress, comprising a senate of 30 members elected for nine years, and a house of deputies of 158 members elected by the people at the ratio of one deputy for every 49,000 inhabitants (census of 1914). The cabinet is appointed by and is under the direction of the president, and comprises the departments of foreign affairs; finance; interior; justice and public instruction; war; agriculture; marine; and public works. President at the beginning of 1925, Dr. Marcelo T. de Alvear (assumed office, Oct. 12, 1922); vice-president, Dr. Elpidio Gonzalez.

**HISTORY.** The special session of Congress which was in session when the year opened was dismissed by President de Alvear on January 21. All the government measures, including the budget for 1925, were withdrawn. The reasons given in the press for this action were the inactivity of the two houses and the inability to obtain a quorum to do business.

In the early part of the year the dispute with the Vatican over the question of appointments was satisfactorily settled. As noted in the preceding YEAR BOOK, the Argentine government declared that the Papal Nuncio, Mgr. Giovanni Beda Cardinale, and his secretary were personæ non græ. Although no reasons were given to the Vatican for this action, the wishes of the government were complied with and a new appointment satisfactory to the government was made.

In the fall an extra session of Congress was called to consider the 1926 budget and the State railway bill. The president called attention to the fact that the congress had not as yet adopted the 1925 budget bill and this seriously hampered the preparation of the 1926 measure because of inability to make comparisons or to use the 1925 bill as a basis for the 1926 bill. The 1926 measure was the largest in the history of the country and included a recommendation for the inclusion of an income tax.

**ARIZONA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 334,162. The estimated population on July 1, 1925, was 407,702. The capital is Phoenix.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Barley	1924	20,000	600,000	528,000
	1925	20,000	600,000	700,000
Wheat	1924	32,000	672,000	448,000
	1925	32,000	672,000	1,746,000
Hay	1924	162,000	585,000 *	9,527,000
	1925	165,000	559,000 *	9,495,000
Grain sorghums	1924	30,000	600,000	780,000
	1925	30,000	660,000	486,000

\* tons.

**MINERAL PRODUCTION.** Arizona is one of the most important mineral producing States. Its most important product was copper, in which it ranked first in the amount produced. Copper mined in 1924 amounted to 672,365,115 pounds, compared with 615,493,561 pounds in 1923. There were produced in 1924, 232,113 fine ounces of gold, valued at \$4,798,200, compared with

296,437 fine ounces, valued at \$4,798,200 in 1923. Silver produced in 1924 was 6,127,900 fine ounces, valued at \$4,266,706, compared with 7,376,832 fine ounces, valued at \$6,049,002 in 1923. Other mineral products of value were lime and stone. The total value of the mineral production of the State in 1923 was valued at \$105,065,693, compared with \$63,737,720 in 1922.

**FINANCE.** According to the summary of the United States Department of Commerce, the total payments for all purposes during the fiscal year ending June 30, 1924, amounted to \$7,206,310. Of this amount, \$5,255,920 was expended for the maintenance and operation of the general departments of the State. The remainder included apportionments for education, the interest on State debt, and outlays for permanent improvements. For the maintenance and operation of general departments, the expenditure was \$13.56 per capita, compared with \$12.29 in 1923, and \$10.02 in 1918. The largest expenditure, \$2,686,831, was for highways.

The revenues of the State for the fiscal year 1924 amounted to \$7,770,428, leaving a balance over all expenditures at the end of the year of \$564,118, and a balance of \$2,368,596 excluding the payments for permanent improvements. The chief sources of revenue were property and special taxes. These amounted to \$11.30 per capita in 1924; \$10.68 in 1923, and \$11.42 in 1918. Other sources of revenue were earnings of the general departments, and business and non-business licenses. The total net indebtedness of the State on June 30, 1924, was \$2,268,030, or \$5.85 per capita, compared with \$6.22 in 1923 and \$2.52 in 1918. The assessed valuation of all property in the State in 1924 was \$699,142,997. Taxes levied amounted to \$4,057,433; and the levy per capita, \$10.47.

**TRANSPORTATION.** The mileage of steam railways at the beginning of 1925 was 2460. There were constructed, during 1925, 16.24 miles, all of first track.

**EDUCATION.** New rules and regulations in regard to certification of teachers went into effect on July 1, 1925. Following that date no one can be an applicant for examination for a trial certificate unless he is a graduate of an improved four-year high school, and has 30 semester hours of training in a normal school or university. This rule signifies the elimination of untrained teachers in the State. The rule was adopted in 1920 and gave untrained teachers an opportunity to receive training before July 1, 1925. The State thus now has trained teachers in every school in the State.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1924, the value of products of the manufacturing establishments of the State in 1923 aggregated \$123,377,000, compared with \$39,110,000 in 1921 and \$120,769,112 in 1919. The average number of wage earners employed during 1923 was 9008, compared with 4774 in 1921 and 10,347 in 1919. The copper smelting and refining industry was the leading one in Arizona, as measured either by the number of wage earners or by the value of products. In this industry the average number of wage earners employed during 1923 was 3664, and 916 in 1921. The value of the products of this industry amounted to \$95,946,000 in 1923, compared with \$19,333,000 in 1921 and \$94,184,000 in 1919. The number of establishments whose

output was \$5000 or more decreased from 269 in 1921 to 286 in 1923.

**CHARITIES AND CORRECTIONS.** The Board of Directors for the State institutions have general charge of the charitable and correctional institutions of the State. These include the State Hospital at Phoenix, the State Industrial School at Fort Grant, the Arizona State Prison at Florence, and the Arizona Pioneers' Home at Prescott. The Legislature of 1925 established a State Code of Vital Statistics under a State Registrar who appoints local registrars for rural districts outside of incorporated cities and towns.

**LEGISLATION.** A measure was passed permitting cities and towns to adopt zoning ordinances. The teaching of the Constitution of the United States; Arizona; and of American institutions and ideals in the public schools, was required by statute. A State code of vital statistics was authorized. It was made a misdemeanor to contribute a statement or news item to be published in the State, knowing it to be untrue; and allowing fine or imprisonment on the complaint of the publisher or any person injured by the publication. Arizona ratified the Child Labor Amendment to the Constitution.

**POLITICAL AND OTHER EVENTS.** Not much happened of political interest in the State during 1925. Gov. George W. P. Hunt, who was re-elected in 1924, devoted the greater part of his message, in January, 1925, to an extended discussion of the Colorado River Compact, a project which included the coöperation of seven States for irrigation purposes, in the development of the Colorado River Basin. Governor Hunt held that while Colorado and the States of the upper basin were well protected, Arizona was at a disadvantage in the lower basin, because of the danger that California might, under the proposed agreement, divert water that would be required for the future needs of Arizona. He suggested that a supplementary understanding might be reached by Arizona, California and Nevada so that the compact as a whole might go into effect.

**OFFICERS.** Governor, G. W. P. Hunt; Secretary of State, James H. Kerby; Treasurer, V. S. Wright; Auditor, Wayne Hubbs; Attorney-General, John W. Murphy; State Law and Reference Librarian, Con P. Cronin; State Superintendent of Public Instruction, C. O. Case.

**JUDICIARY.** Supreme Court: Chief Justice, A. G. McAllister; Associate Justices, Henry D. Ross, Frank H. Lyman.

**ARIZONA, UNIVERSITY OF.** A coeducational institution of the higher learning at Tucson, Ariz.; founded in 1885. The 1925 autumn enrollment totaled 1529, and the summer session of 1925 had a registration of 273 students. The number of members on the faculty in the autumn of 1925 was 144. The university receives Federal and State support. The productive funds of the institution were \$22,000, and the income for the year \$990. Plans were made for the construction of a new gymnasium for men, and a new power plant during the 1925-26 academic year. A library was completed at an approximated cost of \$450,000, and was in use by September, 1925. There were 60,000 volumes in the library. President, Cloyd H. Marvin, Ph.D., LL.D.

**ARKANSAS. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,752,204. The esti-

mated population on July 1, 1925, was 1,852,905. The capital is Little Rock.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	2,090,000	33,440,000	\$35,781,000
	1925	2,006,000	28,084,000	27,241,000
Wheat	1924	33,000	880,000	505,000
	1925	30,000	890,000	585,000
Hay	1924	738,000	757,000 <sup>a</sup>	12,000,000
	1925	686,000	534,000 <sup>a</sup>	9,238,000
Oats	1924	275,000	4,950,000	3,168,000
	1925	261,000	4,176,000	2,422,000
Sorghum syrup	1924	36,000	2,088,000	1,942,000
	1925	38,000	2,584,000	2,403,000
Rice	1924	164,000	7,003,000	9,664,000
	1925	174,000	8,039,000	12,058,000
Potatoes	1924	26,000	1,924,000	2,463,000
	1925	23,000	1,680,000	3,528,000
Sweet potatoes	1924	2,000	250,000	2,777,000
	1925	2,000	260,000	3,825,000
Cotton	1924	3,173,000	1,097,985 <sup>b</sup>	124,743,000
	1925	3,867,000	1,530,000 <sup>c</sup>	123,165,000

<sup>a</sup> tons, <sup>b</sup> bales, <sup>c</sup> estimate.

**MINERAL PRODUCTION.** The most important mineral product of the State was petroleum, of which there were produced, in 1924, 44,209,000 barrels, valued at \$40,900,000, compared with 36,616,000 barrels, valued at \$25,400,000 in 1923. The coal production of the State, in 1923, was 1,296,802 short tons, valued at \$5,192,000, compared with 1,110,046 short tons valued at \$4,592,000 in 1922. The production in 1924 was 1,451,503 tons valued at \$5,898,000. Natural gas was an important product. There were produced, in 1923, 24,215,000 M Cubic feet, valued at \$3,255,000, compared with 9,700,000 M cubic feet valued at \$1,798,000 in 1922. Natural gas gasoline produced in 1923 amounted to 16,183,000 gallons, valued at \$1,916,000. The State ranked first in the production of bauxite. This, in 1924, amounted to 327,630 long tons, valued at \$1,981,000, compared with 493,880 long tons, valued at \$2,980,580 in 1923. Other products of importance were lime, sand, gravel, and stone. Small quantities of lead and zinc were also produced. The total value of mineral products in 1923 was \$41,954,319, compared with \$31,418,633 in 1922.

**FINANCE.** According to the summary of the United States Department of Commerce, the total payments for the expenses of the general departments, interest, and outlays amounted to \$10,828,006. Of this \$8,539,353 was devoted to the maintenance and operation of the general departments of the State. Outlays for permanent improvements amounted to \$2,125,844; and interest on the debt, to \$162,809. The per capita expense for the maintenance and operation of the general departments of the State government was \$4.68 in 1924, compared with \$3.92 in 1923, and \$2.46 in 1918. The chief governmental expense was for highways, \$2,974,705.

The total revenue receipts of the State for the fiscal year 1924 amounted to \$13,008,574, or \$4,306,412 more than the total payments, exclusive of the payments for permanent improvements, and \$2,180,568 more than the total payment including those for permanent improvements.

Of the total revenue in 1924, property and special taxes represented 48.1 per cent, com-

pared with 67.6 per cent in 1923 and 75.4 per cent in 1918. The per capita property and special taxes in 1924 were \$3.43, compared with \$3.07 in 1923, and \$2.13 in 1918. Other sources of revenue were earnings of the general departments, and business and non-business licenses.

The total indebtedness of the State on June 30, 1924, amounted to \$2,484,740, or \$1.36 per capita, compared with \$1.38 in 1923 and \$0.86 in 1918. The assessed valuation of property in the State in 1924 was \$602,835,038. The State taxes levied in 1924 amounted to \$5,244,665, and the levy per capita to \$2.87.

**TRANSPORTATION.** The railway mileage at the end of 1924 was 4,972.75. There were constructed, in 1925, 23.5 miles of first track and 11.23 miles of second track, or a total of 34.73 miles.

**EDUCATION.** As the result of regulations made by the State Board of Education, an effort was made during 1925 to raise the standard for certification of teachers. As a result, many teachers attended summer schools in Arkansas and other parts of the country in the summer of 1925. An effort was also made to secure a correct school enumeration, and the school census was reduced by approximately 50,000 children. This results in an increased State apportionment.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$173,005,207, compared with \$119,029,485 in 1921 and \$200,312,858 in 1919. The average number of wage earners employed during 1923 was 44,544, compared with 33,431 in 1921 and 58,202 in 1919. "Lumber and timber products" was the leading industry in Arkansas, as measured either by the number of wage earners or by the value of the products. In this industry, the average number of wage earners employed during the census year was 27,325 in 1923, compared with 20,769 in 1921. The value of the product was \$73,468,000 in 1923, \$44,022,000 in 1921, and \$91,852,000 in 1919. The number of establishments whose output was \$5000 or more, decreased from 1289 in 1921 to 1231 in 1923.

**CHARITIES AND CORRECTIONS.** A Commission of Charities and Corrections had charge of the State charitable and correctional institutions, which include the State Tuberculosis Sanitarium, the Arkansas School for the Blind, the Arkansas School for the Deaf, industrial schools for white and negro boys and the State Farm for Women. During 1924-25 many county boards of public welfare were organized, although the work of the commission was hampered by the lack of funds. The Legislature of 1925 placed the supervision of the juvenile court department of the State in the office of the Attorney-General.

**LEGISLATION.** The article of the State constitution providing for the Initiative, was amended. An amendment was also adopted forbidding the general assembly to pass local bills, and giving counties and municipalities power of local legislation of every character, if not contrary to the constitution or general law of the State. A fine of \$50 to \$100 was set upon for possession of any alcoholic or fermented liquor, and a measure was enacted punishing the erecting of misleading signboards near State highways. The supreme court judges were in-

creased from three to five, and three instead of two are required for a decision.

**POLITICAL AND OTHER EVENTS.** Thomas J. Terral, elected governor in 1924, was inaugurated in January, 1925. Among the recommendations made by him was an increase in the tax on gasoline from four to five cents a gallon. He also advised that the \$3,000,000 a year available from the State highway fund be increased to \$5,000,000. He strongly urged the abolition of useless boards and commissions in order that the revenue thus used might be diverted to more necessary objects. Governor Terral also made a strong plea for increased interest in the county schools. The legislature, in January, ratified the Child Labor Amendment. In the municipal elections held in April, a unique result was the election of a complete women's ticket in the hamlet of Winslow.

**OFFICERS.** Governor, Thomas J. Terral; Secretary of State, J. B. Higgins; State Treasurer, S. S. Sloan; Auditor, J. C. Cone; Attorney-General, W. H. Applegate; Commissioner of State Land, Highways, and Improvements, Herbert R. Wilson; Commissioner of Mines, Manufactures, and Agriculture, J. C. Ferguson; Superintendent of Public Instruction, A. B. Hill; Adjutant-General, Heber L. McAllister.

**JUDICIARY.** Supreme Court: Chief Justice, E. A. McCulloch; Associate Justices, Carroll D. Wood; Jesse C. Hart; Frank G. Smith; T. H. Humphreys.

**ARKANSAS, UNIVERSITY OF.** A coeducational State institution at Fayetteville, Ark.; founded in 1871; comprising a department of law, colleges of arts and sciences, education, engineering, agriculture (including an experiment station) and medicine, the last-named being at Little Rock. The enrollment in the fall of 1925 was 1752, and for the summer school of 1925, 903. The number of members of the faculty in the fall of 1925, including the administrative officers, was 155. The number of volumes in the library was 65,000. The productive funds amounted to \$132,000, and the income for the year 1925-26 was approximately \$750,000. The legislature of 1925 appropriated \$650,000 for new buildings. President, John Clinton Futrall, M.A., LL.D.

**ARMENIA.** A term applied since the World War to the new state known as the Socialist Soviet Republic of Armenia, or the Republic of Erivan. Before the war Armenia sometimes indicated the Armenian territories of the former Turkish Empire and sometimes the entire region in which the dominant race element was Armenian. In the former Turkish Empire the Armenians constituted about 38.9 per cent of the population in the following vilayets: Erzerum, Bitlis, Kharpout, Diarbekr, Sivas, and Van; being in a majority in the first five and in a majority in the last named. The present number of Armenians in the Turkish Republic is unknown, a large part of the Armenian element having disappeared from Anatolia during the War and afterwards as a result of massacres, deportations and migrations. The population for the division known as Armenia and Kurdistan was given at 2,470,900.

**SOVIET REPUBLIC OF ARMENIA.** The Armenian Soviet Republic or the Republic of Erivan comprises the southeast frontier region of Transcaucasia which formerly belonged to the Russian Empire, but which in November, 1919,

split off from Bolshevik Russia. The whole Transcaucasian region comprised the three main peoples, Armenians, Georgians, and Tartars, and was first constituted into a federal republic which lasted only a few weeks, when it was dissolved into three component parts, the Armenian Republic, Georgia, and Azerbaijan, each of which declared its independence. The *de facto* independence of the Armenian republic, declared May 26, 1918, was recognized by the Allies in January, 1920. It fell wholly under Soviet influence; was proclaimed a Soviet republic, April 2, 1921; and later joined the new Russian federated state. Area, 15,240 square miles; population, 1,214,391. Capital, Erivan, with a population of about 90,000.

Agriculture has engaged the great proportion of the population; wheat, rice, licorice root, tobacco, and wine being the leading products. Prior to the War, Armenia produced up to 150,000 bales of ginned cotton annually, but cotton growing decayed completely after the Bolshevik Revolution. Mining made up the most important economic activity before the War, for here were found copper ore, rock salt, and iron pyrite deposits. This industry also decayed after the revolution. The country has great industrial possibilities, for it was estimated that 9,000,000 horse power could be developed from the water courses. The country has been almost entirely cut off from the outside world. It has had no seaport and has been compelled to depend for its communications on the single Transcaucasian railroad that passed through its territory on the way from Batum to Baku.

**ARMIES.** See MILITARY PROGRESS.

**ARMS TRAFFIC CONFERENCE.** The Conference organized by the League of Nations on the Control of the International Traffic in Arms, Munitions and Implements of War opened at Geneva May 4, with 45 countries taking part, and lasted until June 17. The United States, Germany, Turkey and Egypt, non-members of the League, played a part, while South Africa, Australia, Liberia, Mexico and Russia declined invitations to attend. The first two weeks' developments indicated that the eventual document to be signed would be different in many instances from the original convention signed at St. Germain-en-Laye in September, 1919. Among the outstanding causes of debate was the suggestion of the United States to ban gas as a war weapon. There was some opposition to the proposal of Great Britain to exclude warships, airplanes, seaplanes and airships from control. This was passed by a small majority, with the United States voting to exclude. Still another was Great Britain's amendment giving governments the right to search ships suspected of carrying arms designed to foment trouble against them. Representative Burton of the United States stated that that country was willing to sign a convention for the publication of all armaments statistics.

Out of all the controversy it was felt that good would come—the good which results when problems are brought into the light. The *New York Times* in commenting on the Arms Conference said: "In all such enterprises the most dangerous thing is to expect any attempt too much. Viewed in a just perspective, the situation is full of hope. Except for the war and the League to which it gave birth, we should have had no Washington Arms Conference, no

World Court, no Protocol, no Opium Conference, no Conference on Traffic in Arms. None of them has been a complete and shining success. Yet the progress in our understanding all such problems has been vast and the actual achievement has been far beyond what anyone a brief decade ago would have dared to hope."

In the opening days of the Conference Mr. Burton introduced an amendment providing for the formation of a Central International Office, carefully leaving out "The League of Nations." After committee consideration a compromise was reached by which it was decided to have no central international office.

Count Carton de Wiart, a former Belgian premier, was the presiding officer. The United States was represented by Rep. Theodore E. Burton, Hugh Gibson, American Minister to Switzerland, General Ruggles, U. S. A., Rear Admiral Long, U. S. N., and Allen Dulles of the State Department.

The following summary indicates the general nature of the Arms Traffic Convention and the Protocol adopted at the Conference.

#### SUMMARY OF ARMS TRAFFIC CONVENTION AND PROTOCOL CONCERNING CHEMICAL AND BACTERIOLOGICAL WARFARE

For the purposes of the Arms Traffic Convention all arms and implements of war were divided into five categories under varying degrees of restriction and regulation.

Category one comprised arms exclusively designed for war-like purposes, including rifles, machine guns, cannon, grenades, tanks, and armored cars.

Category two included arms capable of use for both military and other purposes.

Category three included ships of war and submarines.

Category four included aircraft and aircraft engines.

Category five included arms and ammunition having no military value.

Arms included in category one may be shipped only to a government or, with the consent of a government, to a public authority subordinate to it. In connection with any such shipment a written order endorsed by the government of the importing country or by its duly authorized representative and containing all the information necessary to establish the propriety of its execution must be presented to the authorities of the exporting country. Permission to export arms in category one must be signified by a license or by an export declaration filed with and approved by the competent authorities of the exporting state. Such a license or declaration must contain a general description of the arms shipped and an indication of the name and address of the exporter, the name and address of the consignee, and the name of the government which has authorized the importation.

Arms in category two may be shipped either in virtue of a license or in virtue of an export declaration issued by or filed with the authorities of the exporting country, but not necessarily approved by them. Neither the license nor the export declaration entails any responsibility upon the government of the exporting country as to the destination or ultimate use of any consignment.

Articles covered by category five may be exported without formalities or restrictions, except those incident to the control of shipments to the special zones in Africa and Western Asia for which a special régime has been set up.

The system of licenses or export declarations is likewise inapplicable to categories three and four. These categories are, however, subject to requirements regarding publicity.

The high contracting parties undertake to publish within two months (in case of aircraft, six months) of the close of each quarter statistical returns of their foreign trade in arms, ammunition, or implements of war. The publicity thus provided for is applicable to shipments by governments as well as to private shipments.

In time of war, and subject to the rules of neutrality, the articles of the convention with respect to licensing and publicity for export of arms in areas not comprised within the special zones will be considered as suspended from operation until the restoration of peace so far as they concern exports to or on behalf of a belligerent.

The convention will come into force four months after the date of the notification that a *procès verbal* of the deposits of ratification has been drawn up by the

Government of the French Republic, following the ratification of the convention by 14 powers. For states adhering subsequently it will come into effect four months after the date of their ratification or adhesion.

As previously indicated, special provisions are made for certain regions in Africa and Western Asia. Within these regions and in the maritime zones contiguous thereto the authorities are required to establish and maintain an effective control over traffic in arms of all categories. The United States and other powers having no territorial interest within the zones delimited undertake no responsibility with respect to the enforcement of the control to be established therein. The African zones as defined in the new convention are in the main identical with the areas delimited in the Brussels Convention of 1890, which included the whole of the continent of Africa from the 20th parallel of north latitude to the 22nd parallel of south latitude. However, Southern Rhodesia and a portion of Southwest Africa are excluded, and, by virtue of a declaration attached to the convention, sovereign states such as Abyssinia and Liberia may obtain exclusion from the special zones upon undertaking to apply within their jurisdiction measures of the same character as those provided for the special zones.

In the protocol concerning chemical and bacteriological warfare, the high contracting parties, to the end that the prohibition of such warfare shall be universally accepted as a part of international law, binding alike the conscience and the practice of nations, declare that they accept the prohibition, that they agree to be bound thereby as between themselves, and that they will exert every effort to induce other states to adhere to the protocol. Adhesions will be notified to the government of the French Republic and by the latter to the signatory and adhering states.

**ARSENIC.** In 1925 production and sales of arsenic in the United States nearly equaled the record output of 1924, when the production of white arsenic, refined and crude, produced in the United States was 14,453 short tons, valued at \$2,655,015. Four companies were engaged in producing white arsenic and their sales in 1925 amounted to about 12,000 short tons, selling at from 3 to 6 cents a pound with about 8000 tons in stock at the end of the year. During 1925 about 9000 tons of white arsenic was imported into the United States, most of which came from Mexico and from ports in Germany, with lesser amounts from Canada, Japan and Southern Rhodesia, making a total available supply for the year of about 29,000 short tons. White arsenic was employed in the manufacture of insecticides and for weed killers available for farmers' use.

**ART EXHIBITIONS.** Art exhibitions in the United States continued to increase from year to year, while at the same time, the length of time known as the "Art Season" appeared to grow appreciably shorter. Outside of the usual yearly official exhibitions, the great and growing interest in art matters in America can be traced by the variety and interest of the many exhibitions held by art dealers in their own galleries, which are especially devoted to this purpose. In New York City this was particularly so, and it can be safely said that no phase of art, from the most ancient to the most modern cannot now be enjoyed, to a certain degree, in these galleries, many of which are models of lighting and equipment. A complete list of such exhibitions as these during the art season would fill a volume and it is therefore only possible to mention those which are of the greatest interest and importance.

Exhibitions held yearly include: the summer art colonies of Woodstock, Gloucester, Rockport, Provincetown, Stockbridge, Marblehead, Lyme, Guilford, etc.; the two exhibitions held by the members of the "Salons of America"; the Allied Artists of America; Artists of Chicago and Vicinity; the Art Alliance of America; the Amer-

ican Industrial Art Exhibition, held at the Metropolitan Museum; the International Etching Exhibition, organized by the Brooklyn Museum; the National Portrait Society; the National Society of Women Painters and Sculptors; the National Society of Mural Painters; the New York Water Color Club and the American Water Color Society. Also, the New Society of Artists, a flourishing organization in its sixth year and numbering among its members such men as Robert Henri, Hayley Lever, Guy Péné du Bois, Leon Kroll, Gifford and Reynolds Beal, Maurice Sterne, Mahonyri Young, George Bellows, John Sloan and Gari Melchior. Its special feature this year was the memorial group dedicated to the late Maurice Prendergast.

The Art Students League of New York celebrated its golden Jubilee with an exhibition of work by past instructors and students, numbering practically all the important figures in American art. The centennial anniversary of the National Academy of Design was celebrated by an immense exhibition of American painting and sculpture, covering this period, which opened in Washington at the Corcoran Gallery. A tercentenary pictorial pageant of New York City's development was arranged in the John Wanamaker Stores in New York, a stupendous undertaking. In Los Angeles was held the first "Pan-American" exhibition of 500 paintings. Artists were represented from all the South American countries and Mexico, and prizes to the value of about \$10,000 were awarded. Rivera, a Mexican painter, won the Los Angeles Museum first purchase prize, the second going to Andrew Dasburg and the third to Guy Péné du Bois. The chief prize of \$5000 donated by Mr. and Mrs. Allan C. Balch of Los Angeles was divided between John Carroll and William Wendt. The Mary Stendhal Prize was divided between Alfonso Villareal, Mexico, and Manuel Cabre, Venezuela, and the Biyouac Art Club purchase Prize was awarded to Luis Martinez and Maria Bonfiglio of Mexico.

Memorial exhibitions were held for William Sartain, George Bellows, Maurice Prendergast, and John Neagle, an early American portrait painter. Also, a centennial exhibition for George Inness. Exhibitions of unusual merit and interest were: a collection of very fine drawings of old masters; a fine loan exhibition of portraits by Raeburn; a superb loan exhibition of Old Dutch masters; an exhibition of early American portraits at the Carnegie Institute; a group of modern French paintings selected by Pierre Matisse; the Brooklyn Museum Exhibition of International Art; and the Wembley Collection of ancient and modern British Art.

Outstanding "one-man" shows were: the late George Bellows; the Spaniard, Ignaz Zuloaga; Emile Bourdelle, the French sculptor; portraits by the late Thomas Eakins; Frank Brangwyn in Boston; Utrillo; Vlaminck; Romaine Brooks; the symbolic art of Walter Beck; paintings and pastels by Toulouse Lautrec. Others were by Eugene Speicher, Leon Kroll, and Emile Fuchs.

European exhibitions of note included: the "Salon d'Automne" and the "Society of Independents" in Paris, where many Americans were represented; the Royal Academy in London with Orpen and Lavery as principal figures; the

Academy of Fine Arts in Berlin with a memorial exhibition for Hans Thoma; the "Tri-National Art Exhibition" in London and the International Exhibition in Rome where Maurice Sterne represented America. Of particular interest in Paris were: exhibitions of ancient Spanish Art; of Oriental Art with objects numbering over 1000; one of Roumanian Art; and an impressive exhibition of "French Landscape Painting from Poussin to Corot." An "International Exposition of Decorative Art" was the great feature for the year in Paris. With the exception of Germany and the United States, all the nations contributed and many of the pavilions were most interesting in their adaptations of modern motifs in decorative art. The Petit and Grand Palais the Pont Alexandre and the Place des Invalides were utilized for this purpose in a highly decorative ensemble.

PENNSYLVANIA ACADEMY. The 120th exhibition of the Pennsylvania Academy of Fine Arts opened with an unusually fine array of paintings, larger than usual, and an increase for the better in the sculpture department. The great gallery F, in particular, appeared especially impressive, with examples by the late George Bellows, Frederick Frieseke, John Sloan, George Elmer Brown, Edmund Tarbell, Paul King, Daniel Garber, Leon Kroll, Leopold Seyffert, and Charles Hawthorne. Many other Academicians and well-known painters were represented by meritorious work. The prize winners were: William James, awarded the Beck gold medal for the "Portrait of a Woman"; Clifford Adams, the Temple gold medal for his delightful landscape entitled, "Washington Square, New York"; Walter Baum, the Sesnan gold medal for a typically pleasing landscape "Sunlight and Shadow"; Frederick Bosley, the Locust Club Medal for an interior with figures, "Elizabeth and Emily." Walker Hancock, the young St. Louis sculptor, was awarded the Widener gold medal for "Toivo," the bust of a boy.

Other sculptors exhibiting were Charles Grafly, with his model of the Meade Memorial; Albert Laessle; Arthur Lee with a fine torso of a man; Malvina Hoffman, Albin Polasek, John Gregory, Bryant Baker, Anna Coleman Ladd, and Chester Beach.

ARCHITECTURAL LEAGUE. In place of the annual exhibition of the League at the Fine Arts building there took place in the Grand Central Palace a combination exhibit of "Architecture and the Allied Arts," sponsored by the Architectural League. The general effect was extremely impressive, not only the large number of exhibits, but the transformation of four great floors of the Palace into a series of varied interiors where the exhibits were shown in a most artistic manner. Eight medals were awarded by the League and five by the American Institute of Architects. The recipients of the League medals were: Arthur Loomis Harmon, and Meller, Meigs, and Howe, of Philadelphia, architects; Arthur Covey, mural painter; James Earle Fraser, sculptor; Nicola D'Ascenzo, craftsman; O. C. Simons, landscape architect. Leon V. Solon was awarded the Michael Friedsam medal for the one who did the most for industrial arts during the year, and Alfred Lenz received the Avery medal for sculpture.

The American Institute medals were awarded as follows: Arthur Loomis Harmon, architect-

ture; Maginnis and Walsh, Boston, ecclesiastical architecture; E. L. Tilton and Alfred M. Giffens, monumental and government buildings; Sprowl and Rolfe, educational and institutional buildings; Walker and Gillette, domestic architecture.

**NATIONAL ACADEMY, SPRING.** The one hundredth annual exhibition opened with a display of 422 pieces of which 55 were by Academicians, 84 by associates, and 283 by non-members. The five new Academicians elected were: John F. Carlson, Eugene Speicher, Edward McCartan, Jonas Lie and Leopold Seyffert, all painters with the exception of Mr. McCartan. Five new associates were likewise elected as follows: Malvina Hoffman and Harriet Whitney Frishmuth, sculptors; John Ward Dunsmore, Raymond Perry Neilson and Hayley Lever, painters. The exhibition throughout made a joyous and colorful impression, with many large canvases and a predominance of landscape. The sculpture was small both in number and size of the offerings. The Altman Prizes for the best landscapes were awarded to Mr. Hobart Nichols, N.A., and Ernest L. Blumenschein, A.N.A. Miss Gertrude Fiske, A.N.A., received the Thomas Clarke Prize for the best figure composition; the Isaac Maynard Prize for the best portrait went to William Auerbach-Levy. The Hallgarten Prizes were awarded to Clarence Johnson, Stanley Woodward, and Jerry Farnsworth. "Landscape with Figures," a striking effort by John Costigan, won the Saltus Medal and Carl Rungius received the Speyer Memorial Prize for the best animal painting. The winter Academy Exhibition was replaced this year by the Centennial Exhibition.

**CARNEGIE INSTITUTE PITTSBURGH.** The twenty-fourth Carnegie International was held in the autumn instead of early spring as formerly. Three Americans, Kenneth Hayes Miller, Leopold Seyffert, and Daniel Garber; Hermengildo Anglada y Camarasa of Spain; Robert Laurent of France; and Algernon Talmadge of England composed the jury of award. The exhibits numbered 488, of which 122 were American, 106 British, 62 French, 35 Italian, 32 Spanish, 16 Belgian, 13 Swedish, 16 Dutch, 19 German, 11 Austrian, 14 Czecho-Slovakian, 13 Polish and 29 Russian, making the largest exhibition but one ever held by this Society. The Germans were exhibitors for the first time in 10 years. Henry Eugene La Sidaner (French) was awarded the first prize of \$1500 for his mild and poetic "Window on the Bay of Villefranche"; a carefully painted nude by Ubaldo Oppi (Italian) received the second prize of \$1000; and Charles Hawthorne the third for a group, "The Captain, the Cook and the First Mate." Emily Court (English) won the Allegheny County Garden Club Prize, awarded this year for the first time. Louis Legrand received first honorable mention for a brilliant work, "In the Café." Other honorable mentions were awarded to Henry Bishop, Rosalie Emslie and Leon Kroll, the first two British painters. Among the American paintings was a group by Sargeant 8 by 10 feet, entitled "The Daughters of Mrs. Charles Hunter," painted 30 years ago. The impression of the exhibition as a whole was one of a more academic trend than last year.

**ART INSTITUTE, CHICAGO.** The 38th annual Exhibition of American Paintings and Sculpture opened with nearly 300 works, 235 of

which were paintings and 58 sculpture. A new portrait prize of \$1000, offered by Mr. and Mrs. Frank Logan, attracted an unusual number of enterprising canvases. The fortunate winner was Leopold Seyffert with a "Self Portrait." Large canvases were predominant as was also a well-marked conservatism. The chief prize of \$1500 and the Logan medal were awarded to Albin Polasek for his sculpture "Unfettered." Other prize winners were: Chester Beach, the Potter Palmer gold medal and prize of \$1000 for "Sea Horse"; Estelle R. Kohn for "Maturity," the Mrs. Keith Spaulding Prize of \$100 for sculpture; Emil Zettler, the William French gold medal for his "Caen Stone Torso"; Russell Cowles, the Norman Waite Harris Prize for his painting, "Consolation of Ariadne"; Mary F. R. Clay, the Kolstamm Prize; Wilbur G. Adam, the Peabody Prize; Paul Trebilcock the Martin Cahn Prize; H. R. Rittenberg, the second Harris Prize for a still-life. Honorable mentions were given to Edmund Ward, Erwin Frey, Harry de Young, and E. Dwey Albinson. Over 1200 works were offered for this exhibition.

**SOCIETY OF INDEPENDENT ARTISTS.** There were 760 artists represented at the ninth annual exhibition of this Society, which made it the largest since the initial opening. The exhibits numbered 1180 in all, quite an overwhelming sight. A new plan inaugurated, that of hanging the paintings in sympathetic groups rather than by the alphabet, met with varying success. Two memorial groups were included: five paintings by the late Maurice Prendergast and five by George Bellows. Both of these artists were members of the original board of this Society. Fifteen works were sold before the exhibition closed and several groups were invited from the exhibition together with a number of "one-man" exhibitions, by owners of New York galleries. Chicago and Buffalo have now established "Societies of Independent Artists," with no juries and no prizes.

**ART MUSEUMS.** Activities in American art museums continued with unabated fervor during the year 1925, both in the building and planning of new museums and in the acquisition of art objects. As a Christmas gift to the Metropolitan Museum, came the immense and unexpected bequest from the estate of Frank A. Munsey, well-known publisher and newspaper man. This bequest, unrestricted and the largest ever made to an art museum, is estimated to be in the neighborhood of \$40,000,000, and was a complete surprise to the Museum directors. The Collis P. Huntington Collection of 188 old masters, including a Vermeer of great beauty, was an important acquisition; the purchase of the George Gray Barnard Collection of Gothic Art, "The Cloisters," situated in Upper New York City, and consisting of over 600 separate entities, was an event of far-reaching importance. This purchase was made possible through the generosity of John D. Rockefeller, Jr., who gave \$1,000,000 as an unrestricted gift. Other additional items were: the Alfred Duane Pell bequest of a collection of European silver; the Munn bequest of American silver; a group of Renaissance bronzes, a gift of Ogden Mills; additional pieces of the famous Riggs Collec-

tion of armor; French and Venetian furniture of the 18th century. Greek vases, a Roman sarcophagus, two small Greek portrait statues, a torso after Praxiteles, and some early Greek terracottas were added to the Classical Department. An original drawing by Michelangelo, a portrait by El Greco, a 14th century French wood statue of the "Madonna and Child," a portrait by Copley, a female torso by Arthur Lee, American sculptor, and a portrait of George Washington by John Trumbull, were single important acquisitions. The Oriental Department was enriched by various objects of art, including Chinese bronzes and potteries, Persian miniatures, and Indian sculptures. Eight Limoges enamel plaques of the 16th century and some fine French faience were acquired by gift.

The Detroit Institute of Art announced these acquisitions by purchase: "St. Jerome," by Petrus Christus; two mediæval Flemish wood statues of angels; a lunette by Carlo Crivelli; a painting by Perugino, the master of Raphael; a Tiepolo; three paintings from the Castiglione Sale; "the Mystic Marriage of St. Catherine," Correggio; portraits by Van Dyck and Rubens, and a triptych by an early Cologne master; a sculpture by Ivan Mestrovic. Gifts announced were: a marble "Bust of a Lady" by Mino da Fiesole; an encaustic portrait of the first century B.C.; a panel of the "Virgin and Child" by Matteo di Giovanni; a rare 16th century Persian silk rug, donated by Mr. Edsel Ford; a panel by the Siennese painter Sano di Pietro, the gift of Sir Joseph Duveen; a bronze of Louis XIV, by Girardon; and portraits by Jan de Bray and Degas.

Acquisitions by the Boston Museum included: a bequest from the estate of Mrs. Sara Greene Dexter of eight paintings by Copley, a Van Dyck, an Andrea del Sarto and a portrait by Rigaud; an important purchase of work by the "Master of Moulins," a portrait of a man; also, examples of the work of Gilbert Stuart, Gainsborough, Reynolds, Fantin Latour, Sargent, Renoir, Picasso, Boudin, Dodge Macknight and George Bellows. To the growing collection of the Minneapolis Art Institute were added: a "Temptation of Christ" by Titian; a "Portrait of a Venetian Noblewoman" by Tintoretto; a 15th century marble relief by Rossellino; an interior by Pieter de Hooch; a portrait by Duvivier; an ancient Chinese portrait; and a pastel by Mary Cassatt.

The late William A. Clark's Collection, valued at \$3,000,000, with an endowment fund of \$700,000 to provide a new wing for the housing of this collection, was the important addition to the Corcoran Art Gallery, in Washington. This collection was refused, owing to the conditions attached, by the Metropolitan Museum. The Albright Art Gallery added to its permanent collection, paintings by Paul King, Robert Spencer, Louis Kronberg, Abbot Thayer, and sculptures by Cecil Howard and Ivan Mestrovic. The Cleveland Museum was enriched by the addition of two antique marbles, a sculptured head by Gaston LaChaise, and a portrait by Eugene Speicher. A bequest of nearly \$5,000,000 from the late Edward Libbey was added to his already generous donations to the Toledo Museum. The Baltimore Museum announced the purchase of their permanent home, and the Newark Museum opened its new building, made

possible through the generosity of Mr. E. Bamberger. A unique number of ancient Chinese sculptures and tomb figures formed the addition to the Pennsylvania Museum department of antiquities. Paintings by Besnard, Daumier, and Toulouse Lautrec were acquired by the Chicago Art Institute.

The Brooklyn Institute Museum announced the opening of a new wing for the housing of African, primitive American and South Sea art. Additions to their permanent collections included: "France Saluant," a bronze figure, 15 feet high, by the French sculptor Emile Antoine Bourdelle; and an example of the work of Ivan Mestrovic. The Worcester Museum purchased a 14th century "Madonna and Child" by the painter Caterino. The opening to the public of Fenway Court, the beautiful Renaissance palace, full of art treasures collected by the late Mrs. Jack Gardner of Boston, was an event of outstanding importance. The value of such an acquisition by the American people is incalculable.

**ART SALES.** Notable auction sales in the United States in 1925 were: the important Chiesa Collection of Italian and Flemish masters, many of small size and by lesser known masters; the Oliver and Boyd collections of early American and European paintings, sold in Philadelphia; objects of decorative art, furniture and tapestries from the collections of the late Michael Dreicer and of Eugene Guérin of Paris, dispersed in New York; the Karl Freund Collection of tapestries, furniture, and objects of decorative art; a second installment of the Ruiz Collection of Spanish antiques; the Chamberlin Dodd Collection of furniture and rugs; the Reuling Collection of early American portraits and old masters; and the Joseph Dabissi collection of Italian and Spanish furniture and art objects. A sale of rare Oriental rugs from the famous Benguiat Collection was of great interest.

Outstanding single sales of first importance included: Titian's "Venus and Adonis" from the collection of Lord Spencer, and "La Danseuse" by Renoir, acquired by Mr. Widener for his collection in Philadelphia; a portrait of Giuliano de' Medici by Raphael, a purchase by Duveen Brothers from the collection of Oscar Huldshinsky of Berlin; four examples of English eighteenth century masters—a Constable, and portraits by Reynolds, Gainsborough and Romney, acquired by Mr. Huntington for his collection in California; and a remarkably fine portrait by Rembrandt sold to Frederick Brown of New York. Other single sales were: "The Lomellini Family" by Van Dyck; "The Annunciation," Veronese; "Forest of Arden," Albert P. Ryder; and portraits by Botticelli, Perugino and Vermeer, all acquired by private collectors.

Important London sales for the year included: the Earl of Darnley's Collection of masters of the English 18th century and of the Italian Renaissance; Lady Carnarvon's Collection of old masters, furniture and objects of decorative art; the famous collection of Italian majolica, bronzes, Greek and Roman antiquities and Limoges enamels, gathered together by Sir Frances Cook; the John S. Sargent collection of paintings, drawings and sketches, composed principally of his own work, which brought record prices; the Rudge collection of Rembrandt etchings; and the Henry Wagner and Swann

Collections of old masters, principally 18th century English. A "self-portrait" by Rembrandt was sold in London to Duveen Brothers.

Important events in Paris were: the sale of the Lehman Collection of paintings, pastels, and bronzes of the Renaissance; the dispersal of the Louis Godefroy collection of rare prints and art books; the antiques of Joseph Durighiello; the collection of modern paintings gathered by Paul Poiret; and the D. Schweisguth collection of etchings, including the rare "Jan Lutma" first state, by Rembrandt. Ninety-eight sculptures by Rodin were acquired in Paris by a Philadelphia collector. From the Castiglione Sale in Amsterdam the Louvre acquired a superb example of the painter Nicola Froment.

Of great interest in Berlin was the sale of a "Portrait of a Cardinal" by Mainardi, from the Berlin Museum Collection, to a New York dealer. Other important sales were: the famous Darmstadter Collection of Dresden China; the Duke of Cumberland's collection of old masters, both sold at auction in Berlin; the Zehner Collection of mediæval art, dispersed in Frankfurt, and a collection of engraved works of masters of the 15th, 16th, and 17th centuries, sold by Boehner Galleries in Leipzig.

**ASPHALT.** A sharp increase in the production of native asphalt and allied bitumens was reported for 1924 in the United States Geological Survey's August, 1925, summary of Mineral Resources. Domestic production of asphalt from petroleum, particularly from Mexican petroleum, its chief source, likewise rose. The native asphalt production was 570,865 short tons, value \$3,988,082, for 1924; against 400,236 short tons, value \$2,885,631, for 1923. Production from domestic petroleum was 1,158,456 short tons, value \$14,305,007, for 1924; against 995,654 short tons, value \$13,060,174, for 1923. Production in the United States from Mexican petroleum was 1,920,915 short tons, value \$21,710,793, for 1924; against 1,378,722 short tons, value \$16,840,045, for 1923. Imports of crude asphalt rose more moderately, to 156,662 short tons, value \$1,165,253, for 1924; against 138,430 short tons, value \$1,046,603, for 1923. The exports of unmanufactured asphalt on the contrary fell to 52,568 short tons, value \$1,245,670, for 1924; against 72,628 short tons, value \$1,500,869, for 1923. Exports of asphalt manufactures, largely roofing, rose to a total value of \$2,212,260 for 1924, against \$2,075,628 for 1923.

**ASTRONOMY.** Ever since the "star gauges" of Sir William Herschel revealed the disk-shaped form of the galactic system, the importance of ascertaining the number of stars of each magnitude visible in different parts of the sky has been fully appreciated; the stars with measurable parallaxes are all relatively so near that it is only by an analysis of such star counts that the structural features of the universe can be determined. The Mount Wilson Observatory in 1925 had finished a study of the distribution of 70,000 faint stars, of magnitudes 13.5 to 18.5, in the 139 Selected Areas of Kapteyn between

the north pole and declination  $-15^{\circ}$ ; although these areas cover but  $\frac{1}{2500}$  part of the sky, they may be relied upon to reveal the main features of stellar distribution with but little error.

The combination of these data with previous data for the brighter stars shows that at every point of the sky the total number of stars to the fifth magnitude is about three times the total number to the fourth magnitude, but that this ratio falls off for lower magnitudes, especially in the direction of the galactic poles, indicating that the stars thin out more and more rapidly with increasing distance from the sun, the phenomenon being most pronounced in the direction of the poles of the Milky Way. The concentration of stars in the Milky Way is very much greater for faint than for bright stars; for the fourth magnitude the ratio of the number per square degree in the galaxy to that at the poles is 3.4, but for the 21st magnitude it is 45. Ninety-five per cent of the stars are within  $20^{\circ}$  of the galactic plane; less than 1 per cent lie between galactic latitudes  $40^{\circ}$  and  $90^{\circ}$ .

It is estimated that the total number of stars in the whole sky to the 20th visual magnitude, the limit of observation, is about one billion. The data indicate that the total number of stars in the universe is probably between twenty and forty billions; hence the number beyond the limit of observation is many times that within reach of our most powerful telescopes. The investigations of Seares and others on the luminosity function have also shown that the number of very faint stars must be much greater than hitherto supposed. The total amount of starlight is about the equivalent of that of 1076 stars of visual magnitude 1.0 on the International Scale; but stars brighter than visual magnitude 20, comprising only 3 per cent of the total number, are responsible for 98 per cent of this light.

**THEORY OF RELATIVITY.** Einstein rested his generalizations upon the solid ground of authenticated experiments; and hence the relativity theory, in common with all physical theories that rest upon, and seek to coördinate, results of observation and experience to date, is subject to extension, modification, or even rejection, in accordance with the findings of later experiments. Of the three main predictions of Einstein's theory of gravitation, two—the anomalous motion of Mercury, and the bending of rays of light that pass close to the sun—have been so satisfactorily verified as to meet with general acceptance; the verification of the third—the shift of spectral lines toward the red—has not met with such general acceptance, but it too seemed to have been placed beyond question at the Mount Wilson Observatory, where Adams has succeeded in photographing separately, with the 100-inch reflector, the spectrum of the remarkable faint companion of Sirius. This star is a white dwarf, of type F. Since it belongs to a binary system of well determined parallax and orbit, its absolute magnitude, surface brightness, and mass are known, whence its size and density may be computed. The latter turns out to be about 1600 tons per cubic foot; this deduction was considered absurd, until Eddington pointed out that at the high temperatures existing in stellar interiors, practically all the electrons would be stripped from the atoms, and

that the atomic residues would be so small that they could easily be packed close enough to give such an extraordinary density. A binary with such a dense star for one component is a unique and extremely favorable object for a test of the Einstein spectral shift; and differential measures on the spectra of Sirius and its companion revealed an unmistakable shift of the lines in the latter, corresponding to that which would be produced by a radial velocity of 21 kilometers per second, in excellent agreement with the theoretical value of the Einstein shift as calculated by Eddington. The corresponding amount in the sun is only 0.6 kilometer per second.

On the other hand, the famous Michelson-Morley experiment, the reported null results of which formed an important part of the foundation of the restricted theory of relativity, was repeated by D. C. Miller, with an unexpected outcome. In the basement of his Cleveland laboratory Miller found no relative motion between the earth and the luminiferous ether, but on a small hill nearby, an ether drift of 3 kilometers per second was found; and on Mount Wilson, after thousands of careful observations under all kinds of conditions, at all times of the day and night, and at different seasons of the year, an ether drift or motion of the earth relative to the ether, of about one-third the orbital velocity of the earth, was found, which indicated a motion of the solar system through space in good agreement with that obtained in a totally different manner by Strömberg.

At first sight, Miller's results would seem to show that at sea level the adjacent ether is completely dragged along by the earth as the latter moves through space, but that at higher levels there is only a partial drag, becoming less and less the greater the elevation. The known facts of astronomical aberration, and the absence of any discrepancies in the positions of the stars as measured at observatories at different elevations, seem, however, to prohibit this interpretation; neither is the Stokes-Planck-Lorentz ether capable of reconciling all the facts. The interpretation of Miller's results, and their bearing on the theory of relativity, particularly on the general theory, were therefore in 1925 considered uncertain. The equivalence of mass and energy, and of gravitation and inertia, remained in any event untouched; and it should not be forgotten that the restricted theory was founded not only on the result of the Michelson-Morley experiment, but also on the null results of several other equally important experiments, all of which should now be repeated at as great altitudes as practicable.

Another experiment was carried out by Michelson and Gale, in which two rays of light were sent, from the same starting point at the same time, in opposite directions around the same rectangular path, more than a mile in perimeter, back to the starting point again, through large water pipes from which most of the air had been pumped out. By means of an interferometer, it was found that they did not return to the starting point exactly at the same time; this result, due to the effect of the rotation of the earth, shows that the ether is not dragged around by this rotation. Moreover, the difference in the times of arrival agreed with that required by the theory of relativity.

**STELLAR EVOLUTION.** The detailed mathematical theory of the physical constitution of the stars which has been constructed on the basis of modern physics, seems to demand a revision of current theories of cosmogony and stellar evolution. Many lines of evidence show that the life of a star must be enormously long, and that the stars must have within themselves some vast store of potential energy of hitherto unimagined extent. Since it seems impossible to formulate any consistent scheme of stellar evolution if the mass of a star be assumed to remain constant, it is highly probable that the generation of stellar energy comes from the actual annihilation of matter and its conversion into radiant energy, accompanied by a secular diminution of mass. The law of generation of internal heat, and the rate at which the stellar matter allows heat to leak out to space, determine how bright and hot a star of given size and mass shall be. Eddington and Adams showed that in the intensely hot interiors of stars, the atoms are so extensively reduced in size by ionization that they may be packed to enormous densities before the material ceases to obey the laws of a perfect gas; hence the assumption of a fall of temperature in the dwarf stars due to the failure of the gas laws must be abandoned—the low surface temperatures of these stars must be ascribed rather to an increased opacity. Eddington's theory of the physical structure of stars, leading to his mass-luminosity law, requires a star of given mass to be not far from a certain absolute magnitude, but permits it to have any radius and spectral type. Jeans, however, maintains that Eddington's theory is erroneous, and that there is nothing in the physical theory that either leads to a hard and fast relation between mass and luminosity, or that explains the actually observed concentration of the stars into the giant, dwarf, and white dwarf groups.

Russell and Eddington supposed the stars to consist of mixtures of different types of matter, the respective rates of transformation of which into energy increase as the temperature rises, a critical temperature existing for each type, at which the transformation becomes comparatively rapid. Jeans, however, claimed that this would cause stars to be unstable; and he supposes the rates of transformation to be constant under all conditions. Each of these conceptions was made the basis of a new theory of stellar evolution.

**NEBULÆ AND CLUSTERS.** Hubble at Mount Wilson, with the 100-inch reflector, resolved the outer parts of some of the spirals into myriads of separate stars, among which a number of Cepheid variables have been found. From the period-luminosity relation for Cepheids, the distance of the Andromeda nebula is found to be about 950,000 light years, and that of M33 about a million light years.

Shapley found N.G.C. 2070 in the Great Magellanic Cloud, and N.G.C. 604 in M33, to be, respectively, 264 and 198 light years in diameter; the diameter of the Orion nebula is only three light years. The Great Cloud itself is 100,000 light years distant, and 14,000 in diameter; it contains the greatest diffuse nebula now known, 30 Doradus, the Looped Nebula, the diameter of which is nearly 500 light years, and the absolute brightness  $-14$ . The gaseous nebulae and the smaller nebulous clusters in the Clouds are of

INNER CORONA AND PROMINENCES

about the same brightness and dimensions as the nuclei in the arms of M33.

E. W. Brown found, contrary to Jeans, that the observed motions in the spirals are capable of being explained by the force of gravitation. Shapley found that the deficiency of stars in the regions supposed by Hagen to be covered by dark obscuring nebulae does not extend to the fainter stars; Hagen's nebulae are illusions, due to a deficiency of brighter stars in those regions.

STARS. Pease with the interferometer found Mira to be 250,000,000 miles in diameter, Aldebaran 30,000,000, and Scheat 150,000,000; and he also separated the two components of the spectroscopic binary Zeta Ursæ Majoris, which are only  $\frac{1}{40}$  second of arc apart.

Strömberg classified the heavenly bodies into fifty groups—such as giant B stars, dwarf G stars, globular clusters, spiral nebulae, et. al.—and finds that each group is moving as a whole, like a great swarm, along nearly the same direction in space, nearly in the plane of the Milky Way, toward Sagittarius. The velocities of the groups along this celestial highway vary from 12 kilometers per second for the long period Cepheids to 300 kilometers per second for clusters and nebulae. The individuals are flying about within the groups in all directions (though they display some preference for the direction perpendicular to the course of the swarm) with velocities that increase regularly with increase of group velocity.

PLANETS AND SATELLITES. From Coblentz' and Lampland's latest radiometric measurements of planetary radiation, Menzel has calculated the following temperatures: Venus, 60°C.; Jupiter, -135°C.; Saturn, -150°C.; Uranus, lower than -185°C.; moon, 125°C. The average temperature of the whole disk of Mars was -30°C., but the equatorial noonday temperature at perihelion was considerably above 0°C.; the dark regions were hotter than the bright ones; the temperature of the north polar region in winter was -70°C. During the summer season the equatorial temperature conditions at noon on Mars seem to be like the bright cool days on the earth. Spectroscopic observations at Mount Wilson have indicated, however, that the quantity of water vapor in the Martian atmosphere is only 5 per cent of that normally present in the earth's atmosphere, while the amount of oxygen is less than that above Mt. Everest.

The permanent numbers assigned to the minor planets in 1925 were nearing 1100. Beginning in 1925, the double alphabet (completed nearly three times since its introduction in 1893) was to start afresh each year, the first letter to indicate the half-month of discovery.

ASTRONOMICAL PHENOMENA. The total eclipse of January 24, although not of great importance to astronomy because of the brief totality, low altitude of the sun, and unfavorable season of the year, was unique in that the track crossed the most densely populated regions of Canada and northeastern United States. The weather was ideal in the eastern portion of the path. Scientific observations were made from the U. S. Navy dirigible *Los Angeles*. This eclipse belonged to a cycle, the first eclipse of which was a small partial in high southern latitudes in 933 A.D., and the last of which will be a small partial in high northern latitudes in 2177; it was the third Saros return of the famous Spanish eclipse of Dec. 22, 1870, and the first total eclipse

visible in Connecticut or Rhode Island since 1478. The moon was one second of arc behind her predicted place, causing the eclipse to be five seconds late.

The red and infra-red photographs of the flash and coronal spectra taken by H. D. Curtis revealed a number of new lines, some of which do not seem to correspond to terrestrial sources. It is probable, however, that the unknown lines in the coronal spectrum are due to some well known element, perhaps calcium, in a particular stage of ionization.

Nova Pictoris, discovered by Watson in South Africa, May 25, had by June 9 increased to the 1.1 magnitude; Harvard photographs showed it to have been previously an uncatalogued star of the 12.75 magnitude. It was remarkable for the slowness of its changes, requiring months to go through the phases that usually require but a few days.

An object discovered by Wolf on December 22, 1924, the nature of which was in doubt for some time, proved to be a comet, 1924*d*. Ten comets passed perihelion in 1925, equaling the record of 1898. Comet 1925*a*, discovered by Shajn, Simeis, March 22, and J. Comas Sola, Barcelona, March 23, has the largest perihelion distance known, 4.2 astronomical units, a record formerly held by the comet of 1729; comet 1925*b* was found by Reid, Rondebosch, March 24; *c*, Orkisz, Cracow, April 3; *d*, a return of Tempel's second comet, Stobbe, Hamburg, June 11; *e*, a return of Wolf, Baade, Hamburg, July 13; *f*, a return of Borrelly, Schaumasse, Nice, August 14; *g*, a return of Brooks 1889V, Tscherny, Kiev, September 19; *h*, a return of Faye, Baade, Hamburg, October 20; *j*, Peltier, Delphos, Ohio, November 14, and Wilk in Poland, November 19; *k*, Van Biesbroeck, Yerkes, November 17; *l*, Ensor Pretoria, South Africa, December 14.

MISCELLANEOUS. The Julian Day is still to be reckoned from noon to noon. Universal Time, U.T., is the designation of the Greenwich Civil Time now in use by astronomers. The Third Triennial Conference of the International Astronomical Union was held at Cambridge, England, July 14-22.

NECROLOGY. Camille Flammarion, June 4; Father Aloysius Laurence Cortie, S.J., May 16; Rev. Joel H. Metcalf, February 21; John Adelbert Parkhurst, March 1; W. H. Julius, April 15; Hugo von Seeliger, December 2, 1924. Biographical sketches of these astronomers will be found in their regular alphabetical order.

BIBLIOGRAPHY. The more notable publications of the year included: C. G. Abbot, *The Earth and the Stars* (New York); C. P. Olivier, *Meteors* (Baltimore); Cecilia H. Payne, *Stellar Atmospheres* (Cambridge, Mass.); J. H. Fabre, *The Heavens* (London); Mary Proctor, *Evenings with the Stars* (New York), and *Children's Book of the Heavens* (Boston); F. J. M. Stratton, *Astronomical Physics* (London); L. Rudaux, *Manuel pratique d'astronomie* (Paris); E. Strömberg, *Die Hauptprobleme der modernen Astronomie* (Berlin); l'Abbé Moreux, *Atlas Céleste* (Paris); F. Becker, *Eine Fahrt durch die Sonnenwelt* (Berlin); J. Plassmann, *Die Milchstrasse* (Hamburg).

ASTROPHYSICS. See ASTRONOMY.

ATHLETICS, TRACK AND FIELD. The outstanding features in track and field sports during 1925 was the "invasion" of the United States by Paavo Nurmi, the speed marvel of

Finland. A wonderful reception was accorded the visiting athlete, record crowds attending every meet in which he participated, and Nurmi repaid his admirers by giving the most amazing exhibitions of the running art that have ever been chronicled. More than thirty world marks did he better, ranging from the three-quarter mile run to the 10,000 meter test. Nurmi's greatest achievement took place in the old Madison Square Garden, New York City, on the evening of February 14, the occasion being the annual games of the New York Athletic Club. He here stamped himself as the most marvelous runner of all time by covering two miles in 8 minutes, 58½ seconds. This bettered by 11½ seconds the record of Alfred Shrubbs, which had stood for 21 years and which was regarded as unbeatable. The wonderful endurance of Nurmi was attested by a series of performances on three successive nights. On January 15 he established three world records in a meet at Madison Square Garden. He left that night for Chicago, where on the evening of January 16, he broke another world mark. Immediately after this accomplishment he boarded a train back to New York to hang up another new world record for 2000 meters in the Fordham University meet on the night of January 17.

Willie Ritola of the Finnish-American Athletic Club was another athlete to distinguish himself during the 1925 season. He established several new world records, some of them exceeding those previously set by Nurmi. Ritola's most notable feat was the running of 3 miles in 13 minutes, 56½ seconds.

The senior national outdoor championships of the Amateur Athletic Union were held under the auspices of the Olympic Club of San Francisco on July 3, 4, and 5, the individual winners in the several events being:

100 yards, Frank Hussey, New York A. C., 9¾ seconds; 220 yards, Jackson V. Scholz, New York A. C., 20¾ seconds (equals world record); 440 yards, Cecil G. Cook, Salem Crescent A. C., 49¾ seconds; 880 yards, Allan Helfrich, New York A. C., 1 minute, 59¾ seconds; 1 mile, Ray Buker, Illinois A. C., 4 minutes, 19¾ seconds; 6 miles, George Lermond, Boston A. A., 31 minutes, 34¾ seconds; 3-mile walk, Harry Hinkle, Harlem Evening H. S., 22 minutes, 8¾ seconds; 120-yard hurdles, George Guthrie, Ohio State University, 14¾ seconds (new national record); 220-yard hurdles, Charles Brookins, University of Iowa, 23¾ seconds (new national record); 440-yard hurdles, F. Morgan Taylor, Illinois A. C., 53¾ seconds (new world record); running broad jump, De Hart Hubbard, University of Michigan, 25 feet, 4¾ inches (new national record); running high jump, Harold Osborn, Illinois A. C., 6 feet, 7 inches (new national record); running hop, step and jump, H. Martin, Illinois A. C., 47 feet, 11¼ inches; putting 16-pound shot, Bud Houser, Hollywood, 50 feet, 1 inch; throwing 16-pound hammer, M. J. McGrath, New York A. C., 172 feet, ½ inch; throwing 56-pound weight, M. J. McGrath, 36 feet, 8¾ inches; javelin throwing, Henry Bonurn, St. Stanislaus College, 213 feet, 10½ inches (new national record); discus throw, Bud Houser, 156 feet, 6 inches (new national record); pole vault, Harry Smith, Los Angeles A. C., 12 feet, 11½ inches.

The New York Athletic Club was the team winner with a total of 50½ points. The Illinois

Athletic Club finished second with 31 and the Olympic Club third with 21. The Illinois Athletic Club won the senior indoor championship for the third year in succession, the individual victors being:

60 yards, Cecil Coaffee, Illinois A. C., 6½ seconds; 300 yards, Sam Rosen, Illinois A. C., 33¾ seconds; 600 yards, Vincent Lally, St. Anselm's A. C., 1 minute, 15¾ seconds; 1000 yards, Lloyd Hahn, Boston A. A., 2 minutes, 13¾ seconds; 2 miles, Paavo Nurmi, Finland, 9 minutes, 9¾ seconds (new national record); 1-mile walk, Alexander Zellar, Chicago A. A., 7 minutes, 4¾ seconds; 70-yard high hurdles, H. M. Osborn, Illinois A. C., 8¾ seconds; running high jump, H. M. Osborn, 6 feet, 4½ inches; standing broad jump, H. M. Osborn, 10 feet 10¼ inches; standing high jump, H. M. Osborn, 5 feet, 2 inches; putting 16-pound shot, Douglas C. Sinclair, Trenton Times A. A., 42 feet, 3¾ inches.

The University of Southern California was victor in the annual meet of the Intercollegiate Association of Amateur Athletes of America, scoring a total of 33 points. The other scores were: Princeton, 29½; Yale, 26½; Georgetown, 23; Pennsylvania, 22; Cornell, 16½; California, 12½; Penn State, 12; Harvard, 12; Syracuse, 11; Massachusetts Institute of Technology, 7; Holy Cross, 5; Columbia, 5; Bowdoin, 4; Dartmouth, 4; Boston College, 2.

The individual winners in the intercollegiates follow:

100 yards, Bowman, Syracuse, 9¾ seconds; 220 yards, Russell, Cornell, 21¼ seconds; 440 yards, Tierney, Holy Cross, 47½ seconds; mile, Haggerty, Harvard, 4 minutes, 25¾ seconds; 2 miles, Tibbets, Harvard, 9 minutes, 26¾ seconds; 120-yard hurdles, Dye, Southern California, 14¾ seconds; 220-yard hurdles, Grumbles, Southern California, 24 seconds; running high jump, Blake, Princeton, and Hamden, California, tied at 6 feet, 3¾ inches; running broad jump, Norton, Yale, 23 feet, 11 inches; putting 16-pound shot, Hills, Princeton, 49 feet, 5¾ inches (new intercollegiate record); throwing 16-pound hammer, Gates, Princeton, 160 feet, 10¾ inches; javelin throw, Bench, Yale, 186 feet, 4 inches; discus throw, Houser, Southern California, 150 feet, 2¼ inches; pole vault, Sherrill, Pennsylvania, 13 feet.

The annual Western Conference College championships were won by the University of Michigan with a total of 45½ points. Wisconsin finished second with 31 and Ohio State third with 30½.

The national track and field championships for women were held at Pasadena, Cal., the individual winners being:

50 yards, Alta Cartwright, Eureka A. C., 6¼ seconds; 100 yards, Helen Filkey, Chicago W. H. T., 11¼ seconds (equals world record); 60-yard hurdles, Helen Filkey, 8¾ seconds (new world record); running broad jump, Helen Filkey, 17 feet (new American record); running high jump, Elizabeth Stine, Savage School, 4 feet, 10 inches; putting 8-pound shot, Lilian Copeland, Pasadena, 32 feet, 10½ inches; javelin throw, Aloa Silva, Vallejo, 105 feet, 8 inches; discus throw, A. Reichardt, Pasadena, 87 feet, 2¾ inches.

Oxford and Cambridge universities of England sent a combined team to the United States during the year which obtained an even break

in the two meets contested. The Britons defeated the combination team of Princeton and Cornell, but lost to the athletes of Yale and Harvard. See CROSS COUNTRY RUNNING.

**ATOMIC WEIGHTS.** See CHEMISTRY.

**ATOMS.** See PHYSICS.

**AUROMA.** See METEOROLOGY.

**AUSTRALIA, COMMONWEALTH OF.** A self-governing dominion of the British Empire, consisting of the six original states (former colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. The present Commonwealth dates from its proclamation in 1901, under the act of union passed in the preceding year. Of the divisions mentioned above, the Northern Territory was transferred by South Australia to the Commonwealth; and the Federal Territory consists of a former portion of New South Wales. The seat of government in 1925, was still Melbourne, pending the completion of the work on the site of the future capital, Yass-Canberra, on which building operations were begun in 1923.

**AREA AND POPULATION.** The area of Australia is 2,974,581 square miles and the population, according to the census of 1921, 5,435,734. The population was estimated at 5,777,262 on Mar. 31, 1924. The accompanying table from the *Statesman's Year Book* for 1925 gives the estimated area in square miles and the population by states according to the census of Apr. 4, 1921, and also the estimated population by states on Mar. 31, 1924:

States and Territories	Area sq. miles	Population		Estimated March 31, 1924
		Total	Per 100 sq. miles	
New South Wales	309,432	2,100,371	679	2,217,081
Victoria	87,884	1,531,280	1,742	1,637,478
Queensland	670,500	755,972	113	816,267
South Australia	380,070	495,160	130	526,541
Western Australia	975,920	332,732	34	356,469
Tasmania	26,215	213,780	815	215,277
Northern Territory	523,620	3,867	0.7	3,572
Federal Capital Territory	940	2,572	274	3,677
Total	2,974,581	5,435,734	183	5,777,262

The above figures do not include the full-blooded aborigines, whose number was estimated at about 60,000. The population of the capital cities with their suburbs in 1923 were as follows: Sydney, New South Wales, 981,400; Melbourne, Victoria, 852,850; Brisbane, Queensland, 235,687; Adelaide, South Australia, 278,856; Perth, Western Australia, 171,859; Hobart, Tasmania (1921), 52,132. In 1923, the movement of population was as follows: Births, 135,222; deaths, 56,236; surplus of births, 78,986; marriages, 44,541.

According to the United States Bureau of Foreign and Domestic Commerce, the immigration problem of Australia, with its endless miles of unsettled land, continued a live issue. Numerous schemes for attracting desirable citizens have been tried out during the last quarter century, but the results so far have not been satisfactory. Early in the year it was reported that the British and Commonwealth governments had entered into an agreement whereby

Great Britain was to bear a greater part of the cost of financing emigration to Australia than before. Under the scheme both countries were to participate in the flotation of a £34,000,000 immigration loan which was to be handled by the Commonwealth government. For the first five years Great Britain will pay half the interest, but not to exceed 5 per cent of the loan, and one-third of the interest during the second five-year period. In addition, it will continue to participate in the cost of transportation and other sundry items. This obligation on the part of Great Britain represents, it is estimated, a total outlay of £7,000,000 over a period of 10 years. Australia's net immigration gain during 1924 amounted to 45,216, as compared with 38,918 during the preceding year. As heretofore the principal sources were Great Britain and New Zealand, which contributed 50 and 25 per cent, respectively, in 1923, and 46 and 23 per cent, respectively, in 1924. Increases from other countries, however, indicate that the Commonwealth is growing more popular for emigrants other than those from other parts of the British Empire. During 1924 the percentage coming from foreign countries was 16 per cent as compared with only 10 per cent during the preceding year.

**EDUCATION.** At the end of 1923, New South Wales had 3243 government schools with 10,066 teachers and 328,248 pupils enrolled; 681 private schools with 4187 teachers and 80,723 pupils. Victoria in 1922 had 2405 state schools with 6789 teachers and an enrollment of 248,882 pupils; in 1923 the state had 489 private schools with 2154 teachers and an enrollment of 64,195 scholars. During the year 1923 in Queensland there were 1659 state schools with 4129 teachers and an average daily attendance of 102,279 pupils; 169 private schools with 1014 teachers and an average daily attendance of 20,900 pupils. South Australia in the same year had 1015 state schools with 82,192 students; 178 private schools with 14,550 pupils; Western Australia in 1923 had 765 government schools with 51,121 scholars enrolled and an average attendance during the year of 45,213; 119 private schools, with an enrollment of 11,224 and an average attendance of 10,056. In Tasmania nine-tenths of the primary teaching is at state schools.

The average monthly attendance is about 88 per cent of the total children of "compulsory age" (seven to 14) and the average attendance is 81 per cent of the enrollment. In addition to the above there are various high and technical schools in all the states. The capital of each state is the seat of a university: Sydney (1923), 2785 students; Melbourne (1923), 2484 students; Brisbane (1923), 387 students; Adelaide (1913), 720 students; Perth (1913), 182 students; Hobart (1923), 215.

**PRODUCTION, ETC.** The area under all crops in 1922-23 was approximately 16,543,555 acres. The area under the principal crops, with the total yield and the yield per acre in 1923 was as follows: Wheat, 9,703,861 acres, 109,454,842 bushels, 11.21 bushels per acre; oats, 1,014,376 acres, 14,982,155 bushels, 14.77 bushels per acre; barley, 342,196 acres, 6,547,935 bushels, 19.14 bushels per acre; maize, 313,202 acres, 7,388,314 bushels, 23.59 bushels per acre; hay, 3,338,456 acres, 4,148,989 tons, 1.24 tons per acre; pota-

toes, 138,001 acres, 337,108 tons, 2.44 tons per acre; sugar-cane, 216,886 acres, 2,315,982 tons, 15.78 tons per acre; sugar beet, 2045 acres, 20,444 tons, 10 tons per acre. One hundred five thousand, four hundred seventy-six acres were given over to the cultivation of the vine from which 201,524 tons of grapes were produced and 11,427,793 gallons of wine manufactured. Two hundred seventy-five thousand, six hundred eighty-seven acres were under orchards and fruit gardens and the total value of the produce from these was £6,666,842. The total value of all agricultural produce in this year was £84,182,501.

At the beginning of 1923 the livestock census showed 2,390,460 horses, 14,336,673 cattle, 78,803,261 sheep, and 985,930 pigs. In 1922-23 the production of wool amounted to 640,317,589 pounds and the exports to 598,323,990 pounds greasy, valued at £45,813,825, and 112,774,567 pounds scoured and tops, valued at £11,324,939. The provisional estimate for the 1924 production of wool was 563,000,000 pounds.

The total value of mineral production in 1923 was £22,190,526. The total mineral production from the beginning of Australia's history down to the close of 1923, was £1,056,000,000; of this amount £616,000,000 was the value of gold. The chief minerals with the value of their production in 1923, was as follows: Gold, £3,151,418; silver and lead, £3,453,472; copper, £1,245,836; tin, £572,041; coal, £10,587,590; other minerals, £3,180,569. In 1923, according to the latest available figures, gold production was continuing to decline, owing chiefly to the exhaustion of the mines, and the yield was placed at 709,491 fine ounces, as compared with 758,005 fine ounces in 1921, and 755,470 fine ounces in 1922. Western Australia was the main producer and showed the principal decline.

Although approximately 95 per cent of Australia's total exportation consists of primary products, there is, nevertheless, a well developed and well protected manufacturing industry which supplies more than three-fourths the domestic requirements. Given an impetus during the war, when import difficulties arose, it has since expanded materially. According to the latest available statistics (1922-23), there were in Australia 19,173 establishments, employing 412,410 hands; paying £71,133,152 in salaries and wages; value of plant and machinery, land and buildings, £160,463,218; value of materials used, £186,082,663; value added by manufacture, £140,414,473; value of output, £326,497,136. The accompanying table from the *Statesman's Year Book* for 1925 shows the estimated value of the products of Australia in 1922-23:

	1922-23 Thous. £
Agriculture .....	84,182
Pastoral .....	91,475
Dairying, poultry and bee farming .....	43,542
Forestry and fisheries .....	10,845
Mining .....	20,316
Manufacturing .....	131,848
Total .....	382,208

COMMERCE. The following material on the trade of Australia was supplied by the United States Bureau of Foreign and Domestic Commerce: Next to Great Britain, Australia's wel-

fare is probably more dependent upon foreign trade than that of any other country of the world, and for that reason the return of its overseas business to a more normal basis is an event of importance to the Commonwealth. Total imports into Australia during the year ended June 30, 1925, reached £157,097,400 against exports valued at £161,106,100, indicating a favorable balance of £4,008,700 as compared with an unfavorable balance of £21,002,500 for the preceding fiscal period. After deducting net imports of gold and silver amounting to £8,000,000 the 1924-25 merchandise balance is favorable to the Commonwealth by about £12,000,000. In 1923-24 imports had totaled £140,569,900 and exports £119,567,400. The expansion in exports was accounted for either by better prices received or by larger shipments of practically all raw-material items, but particularly wheat, wool, meat, hides and skins, and butter and cheese. Liquors, textiles and wearing apparel, rubber and leather manufactures, paper and stationery, jewelry and instruments—the products of Australia's factories—and ores, concentrates, and coal registered declines from the preceding year.

In value the Commonwealth's increase in exports over 1923-24 amounted to £41,538,700—a very substantial figure in view of the slump in wool coupled with poor prices for wheat during the last months of the year. The increase was strengthening to the economic situation, especially since it was not accompanied by a corresponding increase in the country's purchases of overseas goods, and created, therefore, a balance which can be used in liquidating foreign interest charges, etc.

A gratifying feature of the year's trade, apart from the enormous increase in values received for the country's two staples—wheat and wool—was the expansion of the meat and dairy exports. Australia has had great difficulty in developing an overseas trade in meat and butter, due to its great distance from consuming markets, the lack of suitable transportation for such products, and competition from countries where the cost of production has been lower. Such development will be a great boon to the Commonwealth economically. Foodstuffs of vegetable origin, which include dried and fresh fruits, wheat, flour, rice, jellies, and teas, registered large gains. The largest value increase occurred in wheat, the total for this item being two and a half times that for 1923-24; and while volume figures were not available, statistics covering the first three-quarters of the fiscal year indicated that the quantity increase also was of considerable importance.

Overseas shipments of both greasy and scoured wool registered substantial gains in value in spite of a price slump in the closing months of the year and consequent curtailment of offerings, which resulted in a smaller volume being shipped than during the preceding year. These increases were accounted for largely by the keen competition between foreign buyers during the early part of the wool season, which pushed prices to unusually high levels. Later, prices broke to such an extent that sales were discontinued for a time in an effort to stabilize the market. As the year closed prices were hardening somewhat and sales were being resumed. With the exception of sheep skins, overseas ship-

ments of hides and skins registered increases in values, particularly rabbit and hare skins, and calf, cattle and horse hides.

While some expansion took place in the import market, it in no way compared with the increase in exports. Merchandise imports increased only £6,610,000 over the preceding year. From the Australian point of view this small import increase as compared with the larger one in exports was gratifying, since it allowed the Commonwealth's foreign trade to get back on a favorable basis. To a new and growing country it is essential that the visible balance of trade be "favorable"—that is, produce a net excess of exports—since there is always a large item of invisible imports such as remittances, freight, and interest to foreign investors which must be offset. Principal changes in imports were in corn and flour sacks, petroleum spirit, and automobile chassis; declines of importance occurred in unmanufactured tobacco and dressed and undressed timber. The outlook for Australian trade in 1925-26 was a very hopeful one.

**FINANCE.** The total revenue in 1923-24 was £66,017,203, the chief items of which were customs, £25,177,882; income tax, £11,057,555; excise taxes, £10,572,902; post, telegraph and telephones, £9,757,021. The total expenditure for the same period was £83,813,360, of which £68,345,774 was to be obtained from revenue and £15,467,586 from loans. Included in the above sum were: £31,182,121 for expenditure for War purposes and repatriation, etc.; £6,523,881 for invalid and old age pensions; £8,168,066 for posts, telegraphs, and telephones; £7,324,538 for payments to the states. This last-mentioned figure is explained by the "Surplus Revenue Act of 1910" which provided that the Commonwealth pay to the states a sum equivalent to 25 shillings per head of the population as estimated by the Commonwealth Statistician on December 31 of each year. The aggregate public debt of the several Australian states on June 30, 1923, was £550,878,641 and the Commonwealth public debt on June 30, 1924, was £415,600,099, including £351,997,516 owing in respect of war loans. The estimated revenue for 1924-25 was £63,365,000 and the expenditure, £63,445,183.

**COMMUNICATIONS.** In 1923 the number and net tonnage of the registered vessels in the Commonwealth was as follows: Sailing, 1183 of 38,023 tons; steam, 1086 of 389,523 tons; total, 2269 of 427,546 tons. In 1922-23, 1489 vessels of 4,737,854 tons entered the ports of Australia and 1446 vessels of 4,502,925 tons cleared, making a total of 2935 vessels of 9,240,779 tons. Approximately one-third of the vessels entering and clearing were of British origin. The Australian government owns and operates a line of steamers, which in 1923 numbered 49 of 252,524 dead-weight tons.

In 1924 the total mileage of railways open to traffic of the Commonwealth of Australia was approximately 25,000 miles of which 6580 miles were of standard gauge, 5560 miles of 5 ft., 3 in. gauge, 12,285 miles of 2 ft. 6 in. gauge, and 175 miles of 2 ft. 6 in. and smaller gauge.

In 1925 the state-owned railway had a total mileage of line open for traffic of approximately 27,000 miles. Of this 5500 miles were of 5 ft. 3 in. gauge; 6500 miles of 4 ft. 8½ in. gauge; 14,500 miles of 3 ft. 6 in. gauge; and 200 miles of 2 ft. 6 in. and smaller gauge. During the year 74 miles of 3 ft. 6 in. gauge were opened

in Queensland, giving a total mileage as of June 30, 1925, of 6114 miles. New South Wales had open for traffic 5656 miles, all of 4 ft. 8½ in. gauge, of which 133 miles were opened in 1925. In Victoria 4484 miles were open to traffic June 30, 1925, all of 5 ft. 3 in. gauge, and 50 miles of which represented new construction. In South Australia there were 1190 miles of 5 ft. 3 in. gauge and 1261 miles of 3 ft. 6 in. gauge, or a total of 2451 miles in operation. Western Australia had 3733 miles of 3 ft. 6 in. gauge, 104 miles of which were opened during the fiscal year 1925. The Transcontinental line running between Calgoorlie in Western Australia and Port Augusta in South Australia, a distance of 1052 miles, all of standard gauge, was operated by the Commonwealth government. This line was unique in that for the entire distance mentioned it did not cross a single permanent stream of water, while in crossing the Nullarbor Plain there was an unbroken tangent for 300 miles without a curve.

As was stated in previous YEAR BOOKS, the adoption of the 4 ft. 8½ in. gauge as standard throughout the Commonwealth had been decided upon but the cost of conversion was estimated at £57,200,000, so that the work had to be deferred. However a beginning was made during the year in the reconstruction of the 85-mile line from Grafton to Kyogle in New South Wales and the construction of a new standard-gauge line from Kyogle to Richmond Gap on the border between New South Wales and Queensland and thence to South Brisbane in Queensland. During the year the Australian railways were beginning to feel the effects of highway competition by motor buses and trucks and at the same time rail motor cars were being installed on lines with comparatively light traffic. Twenty of these cars were in operation in New South Wales; 17 in Victoria; and 13 in South Australia, in addition to several such vehicles in the other states. Steam-driven motor cars with coke as fuel were used on the Queensland Railways and internal combustion engines in the other Australian states.

**GOVERNMENT.** The executive power is vested in the king, who acts through the governor-general, assisted by an executive council of responsible ministers who must be members of the federal parliament. Legislative power, where it is not specially reserved to the states, is vested in a federal parliament, comprising a senate and house of representatives. The senate consists of at least six senators from each of the original states, elected for six years, one-half of whom are renewed every three years; while the house of representatives consists of approximately twice as many members as there are senators, the representation being in proportion to the population as shown at the last census. The number in the house in 1924 was 76. The governor-general at the beginning of the year was Baron Forester of Lepe. He was later succeeded by Sir John Baird. The ministry was as follows: Prime Minister and Minister for External Affairs, S. M. Bruce; Treasurer, Dr. C. G. Page; Minister for Home and Territories, G. F. Pearce; Attorney-general, Sir L. E. Groom; Postmaster-general, W. G. Gibson; Minister for Customs, H. E. Pratten; Minister for Works and Railways, W. C. Hill; Minister for Health and Defense, Sir Neville House; Vice-president of the Executive Council,

L. Atkinson; Minister for Migration and Marketing, R. V. Wilson; High Commissioner for the Commonwealth in London, Sir Joseph Cook.

**HISTORY.** The outstanding events at the beginning of the year under review were closely connected with the strike of the waterside workers which at the end of 1924 completely paralyzed Australian shipping. The crisis was reached on January 12 when members of the Waterside Workers' Federation rioted in Sydney in order to prevent the employment of ex-service men in accordance with provisions of the law. The government took immediate action and asked that the union be deregistered because it had virtually declared war against the community. The matter was settled at the end of February when it was announced that the Shipping Labor Bureau, which had long been an object of attack by the Waterside Workers' Union, would be absorbed into that union without any prejudice to the members of the Bureau. The nonunion men, who comprised ex-soldiers and sailors, strenuously objected to this procedure because it was against the spirit of the Preference to Returned Soldiers act. It appeared that this was sure to lead to internal dissension in the Waterside Federation but serious trouble was averted for the remainder of the year. The courts refused to deregister the union but imposed a fine on the president. The union itself imposed a fine on the Adelaide branch for refusing to carry out its orders in connection with unloading some ships. The Adelaide branch refused to pay the fine and threatened to withdraw from the Federation and organize a separate union of its own. Prime Minister Bruce said that the chief result of the strike was to show up the inadequacy of the government machinery to handle a situation of this nature.

The government announced on May 4 that it was attempting to amend the Federal Arbitration Act, to the extent of investing the Arbitration Court with power to enforce rewards and to compel unions to live up to them and respect them. One of the unique provisions of the government measure was that which made unionism compulsory as far as possible and practicable. Closely related to the question of the strike was the decision of the government to sell out the merchant vessels owned and operated by it. This was gradually accomplished during the year.

On January 16 it was announced that Maj.-Gen. Sir Neville House, Director of Medical Services, Australian Forces, was appointed Minister of Defense and Health, to succeed E. K. Bowden, who resigned on account of ill health. Senator R. V. Wilson was appointed chief of the new Immigration Department and to certain other offices formerly administered by the Trade and Customs Department. Mr. Marr, who was the chief government whip, was made an honorary minister and secretary to the cabinet. On May 19, Sir John Lawrence Baird was appointed governor of Australia to succeed Lord Forester, whose term expired in October, 1924. Sir John Baird had had considerable experience as a member of the House of Commons since 1910 and in ministerial and diplomatic posts. Sir John Baird was succeeded by Lord Stonehaven as governor-general in October.

In July Australia was visited by the Amer-

ican fleet and was warmly welcomed by the people of Sydney and Melbourne. In connection with the visit President Coolidge issued the following statement: "In questions touching the great region of the Pacific, I am sure that our aims will always be similar; that with the assistance of the other nations that look out on the Pacific peace will be so clearly the established order that it will become a beneficent condition."

On September 18, Prime Minister Bruce announced that parliament would be dissolved shortly and the people appealed to on the issue of constitutional government in Australia. He said the time had arrived to consider the question: "Is Australia to be governed by Parliament under a democratic constitutional form of government or is authority to be flouted by irresponsible extremists attempting to arrogate to themselves an autocratic dictatorship over the country?" His attack was made chiefly against the labor extremists, who, he said, were boring from within for the purpose of creating labor unrest and destroying the state. He said that the recognized labor leaders had been appealed to in vain and that they often supported the radicals rather than the state and that the labor governments in some of the states of the Commonwealth had refused to cooperate with the Federal government. One of the chief issues of the forthcoming campaign was to be the government's bill known as the Deportation Act which provided that the government could deport persons not of Australian birth who were responsible for labor troubles. Another provision of the bill dealt with immigration and stated that the governor-general could prohibit the entrance into the Commonwealth of aliens on account of economic, industrial, or other conditions, or because they were undesirable, or because they were likely to be difficult to assimilate or unable to assume the responsibilities and duties of Australian citizenship. Union labor attacked this bill strenuously on the grounds that it would be used as a club against the members of labor organizations. The government replied that it was chiefly concerned in the immigration provision and not in the deportation provision.

In the general election held on November 14, the national compulsory voting act was tried out for the first time. This provided that any qualified voter who failed to vote was liable to a fine of \$10. The result of the election was completely favorable to Prime Minister Bruce. His party, the Nationalists, captured 38 seats, the Country Party, 14, and the Laborites, 23. The government also received a majority in the senate. This result was remarkable inasmuch as the governments of five of the six states of the Commonwealth were labor governments. The press interpreted the elections as a revolt against the radical element which was seeking to gain control of the Labor Party. As a result of the compulsory voting law the largest poll ever cast was accomplished, more than 90 per cent of the eligible voters registering their choices at the booths.

On December 3 the ban against immigration from the former enemy countries (Germany, Austria-Hungary, Bulgaria, and Turkey) was lifted.

**AUSTRIA.** A republic of central Europe, proclaimed Nov. 12, 1918, after the revolution following the World War; boundaries defined by the treaty of St. Germain, signed Sept. 10, 1919. It consists of the following nine provinces; the City of Vienna, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. For an account of the transfer of the last-named to Austria in 1921 and the acquisition of the plebiscite district of Oedenburg by Hungary, Jan. 1, 1922, see preceding YEAR BOOKS.

**AREA AND POPULATION.** The area of the Austrian provinces before the World War was 39,012 square miles and the population, according to the census of 1910, was 7,529,935. According to the census of Mar. 7, 1923, the area and population of the new state was as follows: Area, 32,396 square miles; population, 6,535,759, giving a density of 202 to the square mile. The City of Vienna, which constitutes a province, had at that date a population of 1,866,147, making up 28.56 per cent of the total. The other chief cities with their population on Mar. 7, 1923, were: Graz, 152,706; Linz, 102,081; Innsbruck, 56,380; Salzburg, 37,856; Wiener Neustadt, 36,956; St. Pölten, 31,619; Klagenfurt, 27,423; Steyr, 22,111; Mödling, 18,677; Villach, 16,803; Wels, 16,412; and Baden, 14,579. The movement of population in 1922 was as follows: Births, 155,703; deaths, 113,307; marriages, 74,274; divorces (excluding Burgenland), 4808. The number of emigrants in 1923 was 15,497 and in 1924, 2650.

**EDUCATION.** Elementary instruction is compulsory between the ages of 6 and 14, but exemptions are easily obtained for children of the age of 12 or over. In 1922 there were 5213 public and private elementary schools, with 31,687 teachers and 872,106 pupils. Secondary education is afforded by *Gymnasias*, *Realschulen*, middle schools, and middle schools for girls. There were 111 secondary schools of all kinds in 1921-22 with 3196 teachers and 35,884 pupils. There are universities at Vienna (1921, 22,780 teachers, and 11,873 students); Graz (247 teachers and 2746 students); Innsbruck (23 teachers and 2015 students). The universities are maintained by the state. There were also in 1922 two technical high schools; 35 training colleges for teachers; two theological high schools; high schools for agriculture, mining, art and music; and 13 theological colleges of which 11 were Roman Catholic.

**PRODUCTION.** The chief occupation of the country is agriculture. In 1923 the total acreage sown amounted to 4,675,500 acres, 2,110,250 of which were in Lower Austria and 961,750 in Upper Austria. The chief crops with their acreage and yield in metric tons in 1923 were: Wheat, 480,602 acres, 241,912 tons; rye, 932,567 acres, 402,260 tons; barley, 337,435 acres, 171,017 tons; oats, 811,142 acres, 375,378 tons; potatoes, 377,137 acres, 1,426,202 tons; turnips, 125,042 acres, 983,130 tons. The foodstuffs produced are not sufficient for the population. In 1923 there were 282,674 horses; 1,074,993 cows; 302,216 oxen; 68,197 bulls; and 717,459 calves. As a result of the treaty following the World War Austria was deprived of many of her minerals, but the output is still of considerable value. In 1923 the production of lignite was 2,685,467 tons and of

anthracite, 157,650 tons. The iron ore output was 1,211,065 tons, and the output of pig iron, 343,605 tons. Other mineral products are copper, zinc, lead, and salt. Piano-making, and the manufacture of automobiles, textiles, and tobacco are of some importance.

**COMMERCE.** The following information on Austrian trade was furnished by the United States Bureau of Foreign and Domestic Commerce: The Austrian trade deficit in the first half of 1925 was not only less than one-half that incurred during the corresponding period of 1924, but was the lowest deficit recorded in any average half year since the War. The adverse balance was \$49,000,000 as compared with \$108,000,000 in January-June, 1924, according to figures published by the Austrian Statistical Office. The value of total imports declined from \$222,507,000 in 1924 to \$175,566,000 in 1925, the decrease being noted in all categories except livestock. The value of total exports, on the other hand, increased from \$114,920,000 to \$126,215,000, owing primarily to greater foreign sales of iron and steel, paper, and wood products. Whereas in 1924 the Austrian per capita trade deficit, \$32, was second only to that of the British Isles, \$34.50, the deficit for the first six months of 1925 was less than half of the 1924 average. Virtually the total of the 1924 deficit was offset by invisible foreign revenues. These receipts had not since declined, and with the contraction of trade deficits were contributing a corresponding surplus of foreign income—a surplus which can go to meet domestic needs and which has played no small part in the steady improvement of economic conditions in Austria since the first of the year.

#### AUSTRIAN FOREIGN TRADE, FIRST HALF 1924 AND 1925

Item	Quantity		Value (000 omitted)	
	1924	1925	1924	1925
<b>IMPORTS</b>				
Livestock .....	Head 614,151	Head 782,788	\$13,754	\$16,682
Food and drinks .....	Metric tons 602,019	Metric tons 543,776	49,974	47,530
Mineral fuels .....	3,086,676	2,456,178	22,143	15,604
Raw material and half manufactures .....	633,655	511,426	56,195	41,293
Manufactures ..	211,309	147,408	80,441	54,457
Total .....			222,507	175,566
Total, first quarter .....			101,439	86,249
Total, second quarter .....			110,409	89,317
<b>EXPORTS</b>				
Livestock .....	Head 17,904	Head 7,507	562	1,584
Food and drinks .....	Metric tons 18,584	Metric tons 23,899	1,876	2,198
Mineral fuels ..	16,898	20,568	112	126
Raw material and half manufactures .....	884,542	1,286,128	22,447	26,658
Manufactures ..	253,309	266,255	89,923	95,649
Total .....		1,604,357	114,920	126,215
Total, first quarter .....		774,301	47,252	61,048
Total, second quarter .....		830,057	59,910	65,167

**FINANCE.** The accompanying table from the *Statesman's Year Book* for 1925 shows some of the details of the budget as drawn up under the supervision of Dr. Zimmermann, who was appointed commissioner-general in charge of finances by the League of Nations in 1922:

Revenue	Thousands of kronen
Tax revenue .....	1,616,700
Taxes on business .....	3,164,500
Customs .....	1,329,400
Monopolies .....	1,335,705
Telegraphs, telephones and post office ..	1,223,265
Post office savings bank .....	100,023
Expenditure	Thousands of kronen
Interest on debt .....	1,304,234
Subventions to municipalities .....	1,285,286
Pensions .....	1,299,478
Social affairs .....	1,214,346
Railways .....	849,959

The total revenue was 8,671,890,652 kroner and the total expenditure 9,345,980,589 kroner. On Jan. 1, 1924, the total debt of Austria was 23,222,222,000 kroner, divided as follows: Austro-Hungarian debt before 1867, 1,345,000 kroner; 1867-1914, 330,657,000 kroner; war debt, 8,972,000 kroner; new debts, 22,881,248,000 kroner. Beginning July 1, 1925, the Austrian government again placed in circulation silver coins. The silver content of the new schilling piece was only 64 per cent as compared with 80 per cent in the schilling coins issued in the early part of 1924, which were hoarded by the peasants of Austria and neighboring countries and remained in circulation only a few days. The reduction of the silver content was believed to be sufficient to prevent a repetition of this development, and to gradually replace the paper money in circulation. It was reported by the United States Bureau of Foreign and Domestic Commerce in July that the final adoption by the Austrian parliament of the gold balance law, after many months of delay and discussion, was the last step in the process of reorganizing the currencies and finances of the country, necessitated by the depreciation of the currency and the consequent inflation in the years following the War.

The turning point came in September, 1922, when the League of Nations reconstruction programme was adopted, the international loan to Austria floated, and the Austrian crown stabilized at slightly over 70,000. The present law is the logical sequence to the legislation of the autumn of 1924 introducing the new schilling currency, in effect establishing a gold basis. Briefly the gold balance law calls the past a dead letter so far as companies' balance sheets are concerned, prescribing the formulation of new balance sheets on the basis of gold values. Values introduced into the balance sheet must not exceed the current market appraisal of the properties in question, although the value used may be set at any desired figure below the market. No minimum limit is established. The new law, therefore, permits companies to maintain "hidden assets," as hitherto. It is appreciated that substantial sums in taxation will thus be lost to the government, but, nevertheless, all things considered, the policy adopted seemed the most advisable. With the establishment of the new monetary unit and the passage of the gold balance sheet law the statistics for

the first few months tended to indicate that there would be a decline in price levels and an increase in wages which would ultimately tend to reach the pre-war balance.

**COMMUNICATIONS.** In 1924 the Austrian federal railways had a total route mileage of 3195 which included the Southern Railway, the largest private railway, with a length of line of 480 miles, which was taken over in 1924. See preceding **YEAR BOOK**. On November 15th a new line from Friedberg to Pinkafeld was opened for traffic, being the first railway constructed in Austria since the War. It had been under construction for some years, being built to obviate the necessity of passing through Hungary Rechnitz and Pinkafeld, after the annexation of Burgenland to the Austrian Republic. It made possible a cheaper and more rapid communication between the southern and central sections of Burgenland and other Austrian provinces.

During the year progress was being made with the electrification of the Austrian Federal railways as funds from the balance of the League of Nations credits were released and set aside for investment purposes. Fifty additional electric locomotives were ordered during the year in addition to 56 ordered in 1924 and deliveries were to be made progressively until the end of 1927. The new type of locomotive was stronger and heavier but a limit was set as the roadbed in Austrian railways was not able to support unduly heavy weights. It was planned, however, to reinforce the principal portions of the main lines at a future date and more especially the line from Vienna to Salzburg in order to permit the use of more powerful locomotives.

**GOVERNMENT.** At the beginning of 1925, the president of the republic was Dr. Michael Hainisch who was first elected in December, 1920, and reelected in December, 1924. The ministry as constituted on Nov. 20, 1924, was as follows: State Chancellor and Minister of the Interior, Karl Ramek (Christian Socialist); Vice Chancellor and Minister of Justice, Leopold Weber (Pan-German); Foreign Affairs, Heinrich Mataja; Social Welfare, Joseph Resch; Agriculture, Rudolph Puchinger; Finance, Jacob Ahner; Commerce and Industry, Railways, and Food Controller, Hans Schuerff; Education, Emil Schneider; Defense, Karl Vaugoin; High Commissioner for the League of Nations, Dr. Zimmermann.

#### HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** The serious economic situation in Austria which was prevalent throughout 1924 continued to absorb the chief interests of the government and the people. It appeared that the efforts on the part of the national government, composed of Christian Socialists and Pan-Germans, to carry out the plans of the League of Nations, and to better the economic conditions of the country were being thwarted by the activities of the Social Democratic Party, which controlled the municipal province of Vienna. This province under the constitution has complete fiscal autonomy and inasmuch as it controls 60 per cent of the national wealth it was far more interested in benefiting the city than the national government. The 1925 budget of the city and province totaled approximately \$80,000,000 as compared with a total national budget of

\$110,000,000. Other factors which prevented the stabilizing of economic conditions were the excessively high taxes and the inability to obtain loans in foreign countries. The movement for union with Germany seemed to be gaining in headway, although Austria was bound by international agreement not to make any treaty with foreign powers. At a republican demonstration in Magdeburg in February it was stated in no uncertain tones that such a union was strongly desired. The Austrian Secretary of State, Deutch, and Paul Loebe, President of the German Reichstag, were the principal speakers and both expressed the hope that in a short time Austria would become an integral part of the German Republic. As symbolical of the trend of the meeting all the boundary posts between the German states, as well as those separating Austria from Germany, were burned in a huge bonfire. Officially the government stated that amalgamation with Germany was far less to be desired than a return to normalcy at home. This demonstration was also an effort to decry the growing demand for a return to the monarchical form of government in central Europe. Italy and Czecho-Slovakia were openly opposed to any union with Germany. They feared that such a union would seriously interfere with their economic penetration of Austria. The Little Entente, at a meeting in Bucharest, demanded that Austria continue to practice stringent economies, rid Vienna of all Bolshevik propagandists, and cease all agitation for union of any kind with Germany.

**AUSTRIA AND THE LEAGUE.** The Austrian government and people expected that the control of the finances of the country would be dropped by the League of Nations at its 1925 meeting. The League's Commissioner, Dr. Zimmermann, stated that at least three years more of control would be necessary to spend the loan of 80,000,000,000 authorized by the League to be spent for railway electrification. Dr. Zimmermann held out no hopes for Austrian rehabilitation until the entire world had resumed its pre-war production and buying. By that time he thought that foreign capital might be drawn to the country and Austrian products could find a market. He also stated that a way for Austrian emigration must be found to relieve the unemployment situation and make the labor supply more in harmony with the demand. An agreement along these lines was reached with France, by the terms of which, 10,000 Austrian workers were to be sent to France annually to be used in the devastated regions and elsewhere. The International Danube Commission appointed by the League sent an inquiry to the states bordering that river asking them to co-operate in the deepening of the channel so that ocean-going steamers could ply upon it.

On September 10, as a result of the report of a special commission to investigate the financial conditions of Austria, the League of Nations decided to relinquish its control of Austrian finances. After Jan. 1, 1926, the League's control would be limited to assigned revenues and expenditures and the remainder of the reconstruction loan. By July, 1926, this control would be entirely relinquished, if the 1925 accounts were satisfactory. The only stipulations placed upon the termination were that the League advisor to the National Bank should remain at his post for three years and

that the League might reestablish its control if at any time the balancing of the budget should appear endangered. The British delegate, Austen Chamberlain, insisted upon these provisions as a protection to Austrian and foreign investors. On October 14, the Austrian parliament adopted a resolution complying with the conditions laid down by the League of Nations for the termination of financial control.

**ZIONIST WORLD CONGRESS.** When the announcement was made that the Zionist World Congress would meet in Vienna on August 16, it was the cause of a serious anti-Semitic wave throughout the country and particularly in Vienna. A Nationalist organization, known as the Hakenkreuzler, caused continual trouble and expense for the government by a series of riots and demonstrations. On July 17, a band attacked the Stuttgart Casino and completely wrecked several Jewish coffee houses. It was with difficulty that the police were able to disperse the rioters. The Hakenkreuzler demanded that the plans to hold the conference must be abolished. In reply the government stated that the conference would be held and every means at its disposal would be used to give protection to the members of it. One estimate of the damage done by the rioters placed the loss of property at more than \$4,000,000 excluding the cost of the extra large body of police which guarded the conference during its meetings in the last two weeks of August.

**STRIKES.** A serious strike of the bakers of Vienna occurred on November 3. For four days the city was virtually without bread and much suffering ensued. The strike was finally settled on November 6, when the award of the Federal Arbitrations Board was accepted by both sides. The workers received a 5 per cent increase in salary. The press blamed the government for its failure to avert the strike and the employers blamed the government also because of the excessive taxes they had to bear. A strike in the Alpine Montan Steel Corporation's plant was only settled by acceding to the demands of the workers. A strike of the 90,000 Federal officials was imminent throughout the entire year. They complained that their wages were not nearly sufficient to meet the soaring cost of living. The government offered 25 per cent of one month's salary as a bonus and the matter was tided over temporarily.

**SITUATION AT THE END OF THE YEAR.** As the year drew to a close the financial situation in Austria had cleared up to a large extent. The 1925 budget showed a substantial surplus, with the result that many of the excessive taxes were reduced. Counselor of Commerce in the Austrian government, Carl Egan Alma, gave the following summary of conditions in December: "We now import only one-quarter of the amount of coal we imported from Czecho-Slovakia before the War. Five hydro-electric developments in the Austrian Alps, owned jointly by provincial governments and private interests, have replaced this source of fuel. The electric systems are interconnected on the American superpower plan. This year's harvest (1925) will provide food for nine months to come. Before the War Austria imported grain during seven to eight months every year. Most of the 80,000 government employees who were dismissed three years ago through reorganization

plans have been absorbed in commerce and industry. There are 110,000 persons unemployed now, compared with 140,000 last year, out of a population of 6,000,000. Electrification of the Vienna subway and surface transit lines, many of which were formerly operated by steam, has given much employment. Since banks cannot discharge employees without giving them two years' pay, their staffs are larger than the banks desire. As a result the banks have charged electrical companies from 16 to 18 per cent for loans. Savings bank deposits have increased from practically nothing last year (1924) to \$65,000,000 this year (1925) in response to increased confidence in the fiscal system."

#### AUTHORS' LEAGUE OF AMERICA.

An organization founded and incorporated in 1912, whose purpose is to provide mutual assistance in the technicalities and difficulties of publishing and copyrighting to authors. The organization supplies confidential information to members regarding managers, producers, etc., and maintains an authors' fund for the assistance of unfortunate literary workers. The activities of the league are conducted by five departments or guilds: The American Dramatists; The Authors' Guild; The Authors' League Fellowship; The Artists' Guild; and The Screen Writers' Guild. The headquarters of the league are at 2 East 23d Street, New York, while the Screen Writers' Guild maintains headquarters at 6700 Sunset Boulevard, Hollywood, Cal.

**AUTOMOBILE RACING.** Peter De Paolo, nephew of the famous Ralph De Palma, was named by the American Automobile Association as the leading racing driver of the year 1925. De Paolo settled all question as to supremacy by winning the 250-mile contest at Salem, N. H. in the world's record time of 1 hour, 59 minutes, 25 seconds. This race was witnessed by 70,000 spectators. Other victories which fell to the lot of De Paolo during the year included the Indianapolis 500-mile race, which attracted a throng of 145,000 persons, the 250-mile race over the new Baltimore-Washington Speedway and the 250-mile race at Altoona, Pa. In capturing the Indianapolis classic De Paolo set a new record of 4 hours, 56 minutes, 39.47 seconds.

Five speed records were broken at Culver City, Cal., on November 29, four by Earl Cooper and one by Frank Elliott, the winner. Cooper traveled at the rate of 132.6 miles per hour for 75 miles as against 128.6 miles an hour for the same distance made by Leon Duray at Salem, N. H., on October 31. The other records set by Cooper were: 131.8 miles an hour for 100 miles, 130.7 miles an hour for 150 miles, and 120.5 miles an hour for 200 miles.

The veteran driver, Ralph De Palma, contributed nine new records over a mile circular dirt track at Syracuse, N. Y., on September 19 as follows: 1 mile, 43.68 seconds; 2 miles, 1 minute, 27.51 seconds; 3 miles, 2 minutes, 11.73 seconds; 4 miles, 2 minutes, 55.37 seconds; 5 miles, 3 minutes, 41.17 seconds; 10 miles, 7 minutes, 25.54 seconds; 15 miles, 11 minutes, 9.47 seconds; 20 miles, 14 minutes, 55 seconds; 25 miles, 18 minutes, 41.28 seconds.

The winners of the more important speedway races during 1925 were: Fresno, Cal., 150 miles, De Paolo (Dusenberg) in 1 hour, 25 minutes, 49 seconds; Charlotte, N. C., 250 miles, Cooper

(Junior Eight) in 2 hours, 2 minutes, 55 seconds; Indianapolis, Ind., 500 miles, De Paolo (Dusenberg) in 4 hours, 56 minutes, 39 seconds; Altoona, Pa., 250 miles, De Paolo (Dusenberg) in 2 hours, 10 minutes, 23 seconds; Laurel, Md., 250 miles, McDonough (Miller) in 1 hour, 28 minutes, 50 seconds; Salem, N. H., 250 miles, De Paolo (Dusenberg) in 1 hour, 59 minutes, 25 seconds.

The results of the principal European races in 1925 were: Rome, 260 miles, Masetti in 4 hours, 21 minutes, 29.6 seconds; European Grand Prix at Spa, Belgium, 477.11 miles, Ascari in 6 hours, 42 minutes, 17 seconds; French Grand Prix at Lenas, France, 621.38 miles, Benoist in 8 hours, 54 minutes, 37 seconds; Italian Grand Prix at Milan, Italy, 497 miles, Brillipieri in 5 hours, 14 minutes, 33 seconds.

**AUTOMOBILES.** The American automobile industry in 1925 showed the greatest production and registration that had ever been recorded. The preliminary statistics of production of motor vehicles of the United States Department of Commerce gave 3,817,638 passenger cars in 1925 as compared with 3,262,764 in 1924, while in 1925 the production of trucks was 496,998 as compared with 377,344 in the previous year. During 1925, according to the preliminary statistics of the National Automobile Chamber of Commerce, prepared by its general manager, Alfred Reeves, the production of cars and trucks amounted to 4,325,000, of which 3,833,000 were cars and 492,000 were trucks. The increase over 1924 represented 19 per cent. The total wholesale value of cars produced during the year was estimated at \$2,500,000,000, and that of trucks at \$500,000,000. The tire production of the year was estimated at \$55,750,000, while the wholesale value of the motor vehicle tire business was placed at \$886,700,000. The total value of automobile parts and accessories, exclusive of tires produced during the year was in round numbers \$1,000,000,000. Of the cars produced in 1925, 2,157,000, or 56 per cent of the total number were closed cars. The average retail price of a car in 1925 was \$866, while the average retail price of a truck was \$1350. There were employed in the motor vehicle industry and allied lines 3,200,000 persons. The automobile industry paid to the United States government \$126,552,000 in special Federal excise taxes.

Approximately 24,600,000 motor vehicles were registered in the world, of which 20,000,000, or 81 per cent were registered in the United States. Of these 17,500,000 were cars and 2,500,000 were motor trucks. On American farms the total registration consisted of 4,160,000 cars and 440,000 trucks. Of the 3,002,916 miles of highway in the United States in 1925 there were 495,000 miles of improved highway.

The automobile industry not only was important on its own account but for its relation to other business. In 1925 automotive freight shipped over railroads amounted to 3,040,000 carloads. The automobile industry took 84 per cent of the total United States consumption of rubber, 50 per cent of the plate glass, 8 per cent of the copper, 11 per cent of the iron and steel, 65 per cent of upholstery leather, 7,494,000,000 gallons of gasoline, 769,000,000 pounds of crude rubber for tires and 226,000,000 pounds of cotton fabric for tires.

There were in 1925, 70,000 motor buses in

use, a number which included 15,000 produced during the year. Motor transportation to the amount of 11,838 vehicles was being employed by consolidated schools, and 251 street railways were using motor buses with a total so employed of about 5000 vehicles. Twenty steam railroads were using motor buses and in 1925 operated 367 vehicles, while 190 railroads were using gasoline rail motor coaches on short lines while 51 railroads were using motor trucks as part of their shipping service.

In the calendar year 1925, 550,000 motor vehicles were exported, which was an increase of 44 per cent over the motor vehicle exports of 1924 and was 12 $\frac{1}{10}$  per cent of the total number produced. The value of motor vehicles and parts exported in this period, including the engines and tires, was \$392,600,000. The number of motor vehicles imported in the United States during the year was 630.

The motor vehicle retail business in the United States was also large, there being 47,014 car and truck dealers, 55,000 public garages, 75,105 service stations and repair shops, and 61,617 supply stores.

The American automobile business, according to the United States Department of Commerce, was the largest industry in the country, rated on the wholesale value of the products, and in economic discussions it was being increasingly realized that any possible depression in this industry, where there is an enormous payroll, would be reflected immediately in general conditions. The farmer, in addition to the export business, was looked upon as the leading market for the American manufacturer, and it was stated that the farmer could purchase in 1925 an average car with 506 bushels of wheat where it required 1482 bushels in 1913.

On the engineering side, the leading feature of the year was the simplification of automobile engines and cars generally. There were a few radical innovations and the leading manufacturers during the year were continuing along lines already established and sought to simplify those plans so as to develop improved performance and increased durability. The intense competition on the commercial side was reflected in the engineering departments and the various manufacturers were seeking to maintain or improve their reputations for dependability. The use of steel frames was increased and with the large number of closed cars, every effort was being made to reduce the forward posts. The four-wheel brake had become quite general and also air strainers. The tendency at the end of the year was to use more colors to secure more attractive designs.

The 1925 production of motor trucks was over 1000 trucks greater than the previous production record of 392,760 and the volume of business was estimated at \$500,000,000, as compared with \$434,168,992 in 1918. In 1918 and succeeding years, while the motor truck business had a production valued at wholesale in excess of \$400,000,000, yet the average unit cost was considerably higher, due to the smaller number of cars.

In 1925, the Boston and Maine, the New York, New Haven and Hartford, and the Great Northern Railroads, all started coördinate highway transportation to take the place of branch lines, or to supplement rail service. At the beginning of the year such service was carried

on only between Spokane, Portland and Seattle, and on the Boston and Maine Railroad, but at the end of the year 20 steam railroads were operating directly or indirectly 367 motor buses. The tendency of the railroads was to substitute motor buses and trucks on non-paying branch lines and furthermore, electric railways were also adopting motor buses. The American Electric Railway Association reported that on September 1, 251 trolley companies were operating 4452 buses over 12,060 miles of road and by the end of year this number had naturally increased. Many of the buses, especially those for long distance and touring work, were especially built and reflected considerable comfort and luxury. During the year it was possible to travel from San Francisco to Los Angeles in a bus without stopping, diner service being provided.

Interesting legislation was enacted in Connecticut during the year, whereby ability to pay damages was made a condition holding a certificate of motor vehicle registration. This statute provided that the State Commissioner of Motor Vehicles could demand from a registrant certificate of ability to pay damages up to \$10,000 for life and to \$1000 for property whenever he deemed such action warranted. It specified that a demand for a certificate of responsibility was warranted on conviction of an injury to a person or damage exceeding \$100 to property as a result of reckless driving, including speeding, driving when drunk, and evasion of responsibility. The qualification of responsibility might take the form of insurance, surety bond, or a cash or collateral deposit and it was quite significant that it was passed in a State which maintained a complete statistical record of motor accidents and, in the case of every motor vehicle registrant, a record of his conviction of accident. It was interesting to note whether this example would be followed by other States.

During the year 1924 the Dominion Commissioner of Highways reported that 650,231 motor vehicles were registered in Canada, or about one to every 13 of the population. The registration by provinces was as follows: Ontario, 309,441; Quebec, 85,145; Saskatchewan, 70,748; British Columbia, 48,626; Alberta, 48,547; Manitoba, 44,262; Nova Scotia, 20,764; New Brunswick, 20,003; Prince Edward Island, 2590; the Yukon, 105.

**AVIATION.** See **AERONAUTICS.**

**AVIATION, DISEASE AND.** During the sessions of the annual meeting of the British Medical Society, section on diseases of the nose, throat and ear, there was a symposium of occupational disease as it concerns this group of organs, and the effects of flying on the latter were enumerated by Ranken (*British Medical Journal*, November 14). It is assumed that there has been no medical selection of flyers as far as it concerns this organ group. If the aviator already suffers from nasal obstruction with its resultant mouth breathing, flying in general and especially high flying with sudden descent exerts an unfavorable action in more ways than one. The nasal obstruction is aggravated, for flying tends to cause congestion and obstruction of the upper air passages. The augmented mouth-breathing aggravates diseases of the mouth and gums and notably pyorrhea; it further aggravates any existing tonsillitis and laryngitis. By adding to the amount of original nasal obstruction it tends to cause defective drainage of

the frontal sinuses and is no doubt responsible for the headache of which some flyers complain.

High flight and rapid descent naturally disturb pressure relations of the *membrana tympani* and if there is already present some congestion and obstruction of the Eustachian tube, this disturbance is more pronounced. Natural efforts at adaptation may be supplemented by swallowing or self-inflation on the part of the informed patient. But if the pressure on the two sides of the drum-head is not equalized unpleasant results are threatened, notably invagination and even rupture of the membrane; pain; deafness; dizziness; nausea and even swoon.

In theory this state of affairs should be met by medical selection and by refusing licenses until the prospective aviator has been treated for bent septum, rhinitis, sinus disease, pyorrhea, adenoids, tonsillitis, laryngitis, etc. Even in the absence of these conditions the aviator may complain of aeroplane deafness which is only a transient disability lasting at most a few hours. This is due largely to the crack of the exhaust and our main remedies are technical such as the use of silencers, while the aviator may use some form of ear stopper, either a simple plug of oiled cotton or mechanical stoppers attached to his cap or helmet.

**AVIATION, NAVAL.** See **VESSELS, NAVAL; NAVAL PROGRESS.**

**AZERBAIJAN**, a'zër-bi-jan'. A new state constituted in 1918, consisting chiefly of the two former Russian provinces of Yelisavetpol and Baku; bounded on the east by the Caspian Sea, on the west by Georgia and Armenia, on the south by Persia, and on the north by Georgia, Northern Caucasus and Daghestan. The official name is the Azerbaijan Socialist Soviet Republic. Area, about 33,970 square miles and the population, according to official Russian statistics, about 2,096,973, about 75 per cent of whom are Moslems. Baku, the capital and the centre of the petroleum industry, has a population of about 250,000. The oil industry has suffered a severe relapse in recent years. The 1923-24 production was estimated at only 4,200,000 tons as compared with 7,850,000 tons in 1916, and a larger production before the World War. After the outbreak of the Russian revolution in 1917, Azerbaijan with Georgia and Armenia formed a federation, but this broke up in the following year, when the three constituent elements each declared its independence. The de facto independence of Azerbaijan was recognized by Great Britain in 1920. Two months later the Bolsheviks overthrew the government and thenceforth the country was under Soviet control. On Sept. 30, 1920, a military and economic treaty was signed between Russia and Azerbaijan. It now forms a part of the Transcaucasian Federal Socialist Soviet Republic.

**BABCOCK, EARL JAY.** American scientist and educator, dean of the College of Engineering of the University of North Dakota, died September 3. He was born at St. Charles, Minn., June 11, 1865, and graduated from the University of Minnesota in 1889. In 1898 he became professor of industrial chemistry, metallurgy, and mining at the University of North Dakota, director of the North Dakota Mining Experiment Station and dean of the College of Mining Engineering. In 1916 he was appointed dean of the College of Engineering and in 1917-18 was acting president of the University of North

Dakota. From 1897-1902 he was state geologist for North Dakota and worked extensively on various geological surveys and industrial and mining problems. He was much interested in the development of natural resources in the State. He made researches in the manufacture and use of natural cements, lignite coals and pottery clays. He was a member of the executive committee of the State Council of Defense, 1917, and chairman of the Committee on Fuels, Engineering and Research.

**BADEN**, bā'den. A constituent state of the German Republic with a republican form of government since Nov. 18, 1918. It was formerly a grand duchy of the German Empire: bounded by Bavaria on the east and Alsace-Lorraine and the Palatinate on the west. Area, 5819 square miles; population, in 1919, 2,208,503. Capital, Karlsruhe, with 135,952 in 1919. The largest city is Mannheim, with 229,576 inhabitants. No religious census was taken in 1919, but according to the census of 1910, there were 1,271,015 Catholics, and 826,364 Protestants. Education is general, free, and compulsory. There are two universities, viz., those of Heidelberg and Freiberg. In 1924 the total area under cultivation was 2,028,325 acres. Of the total area about 94 per cent is cultivable and 41.2 under forests. Among the agricultural products oats, barley, rye, wheat, potatoes, and vegetables are the most important. In 1924, 37,045 acres planted to the vine produced 3,817,154 gallons of wine. The manufacturers included cigars, jewelry, tiles, clocks, musical instruments, leather, brushes, and silk ribbons. The budget for 1924 and 1925 fixed the ordinary revenue for each year at 162,400,000,000 gold marks, and the ordinary expenditure at 165,700,000,000 gold marks.

The present constitution dates from Mar. 21, 1919. The executive power is vested in a cabinet comprising the state president, five ministers, and three state councilors without portfolios, all of whom are elected by the legislature. Legislative power resides in a unicameral body known as the Landtag. The constitution abolishes all privileges of birth and religion and under it women are endowed with the same rights as the men and are eligible to all public offices. There is universal suffrage for all persons of either sex over 20 years of age. The initiative and referendum and proportional representation have been introduced. The Landtag elected Oct. 30, 1921, for the term ending Oct. 30, 1925, had 86 members distributed at the beginning of 1925 as follows: Centre, 34; Majority Socialists, 20; German Democratic Party, 7; Conservatives, 7; other parties, 18. State President at the beginning of 1925, Dr. Hellpach (Democrat) who also held the portfolio of education and whose ministers were as follows: Interior, A. Remmele (Socialist); Justice, G. Trunk (Centre); Social Affairs and Public Works, W. Engler (Socialist); Finance, H. Köhler (Centre).

**BAHAMAS.** A group of islands north of the British West Indies, off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 661 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1921, of

53,031. The estimated population of Jan. 1, 1924, was 54,886. The important islands, with their populations in 1921, are as follows: New Province, 12,975, containing the capital, Nassau; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; St. Salvador, 4273. The movement of population in 1923 was as follows: Births, 1731; deaths, 1520. Primary education is compulsory from the ages of six to 14. In 1923 the government schools had 6606 pupils, and the aided schools, 2851; schools supported by the Church of England, 738; in Roman Catholic schools, 575. In 1923 the principal exports were sisal, sponge, lumber, tomatoes, shells, and preserved pineapples; and the principal imports were foodstuffs, spirits, raw materials and manufactured articles. In 1923 the exports amounted to £1,834,051 and the imports, £2,120,136. In 1923-24 the revenue was £553,376 and the expenditure in the same period was £452,044. Ship entries in 1923: 1530 vessels of 598,885 tons of which 563 were British of 232,281 tons; clearings, 1528 vessels of 603,437 tons of which 580 of 235,850 tons were British. The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members, and a representative assembly of 29 members, the franchise being based on a small property qualification. Governor at the beginning of 1925, Sir H. E. S. Cordeaux.

**BAKER, IRA OSBORN.** American civil engineer and educator, died November 8. He was born at Linton, Indiana, Sept. 23, 1853, and after studying at Mattoon High School, graduated from the University of Illinois in civil engineering in 1874. In 1877 he received the degree of C.E. and in 1903, was made Doctor of Engineering. He was successively assistant in civil engineering and physics, assistant professor, and in 1880, professor of civil engineering at the University of Illinois. In 1915 he retired from the headship of the department, but continued as a professor. Until his death he taught the graduate course in highway engineering. Professor Baker, where there were no available textbooks, prepared text on tracing paper from which blueprints were made. These later became standard treatises, notably *A Treatise on Masonry Construction* (1889-99-1909); *An Engineer's Surveying Instruments* (1891); and *Treatise on Roads and Pavements* (1903-13-18). Dr. Baker investigated the properties of brick, cement, and concrete. His tabulation of the bearing capacities of various soils had a wide influence on construction. He played a notable part in the development of highway engineering and highway policies both State and national. He was instrumental in organizing the Society for the Promotion of Engineering Education.

**BAKER, JAMES HUCHINS.** American educator and president emeritus of the University of Colorado, died September 10, at Denver, Colo. He was born at Harmony, Me., Oct. 13, 1848, and was educated at Bates College from which he graduated in 1873. Removing to Denver he became principal of the Denver High School in 1875, serving until 1892 when he was made president of the University of Colorado. He became president emeritus in 1914. He formed the plan which led to the report of the National Committee of Ten on secondary education in the United States. He served as president of the National Council of Education in 1892,

and in 1907 he was president of the National Association of State Universities. He was chairman of the Committee of National Council of Education on Economy of Time in Education, and other committees. He wrote *Elementary Psychology* (1890); *Education and Life* (1900); *American Problems* (1907); *Educational Aims and Civic Needs* (1913); *American University Progress and College Reform Relative to School and Society* (1916); *After the War—What?* (1918); and *Of Himself and Other Things* (1922).

**BAKU.** See AZERBAIJAN.

**BALDAUFITE.** See MINERALOGY.

**BALKAN STATES.** The states which make up the Balkan Peninsula in southeastern Europe west of the Aegean Sea. See ALBANIA, BULGARIA, CZECHO-SLOVAKIA, GREECE, JUGOSLAVIA, ROMANIA, and TURKEY.

**BALLING, MICHAEL.** A German conductor, died at Darmstadt, in September. He was born at Heidingsfeld, Aug. 29, 1866. After graduation from the Königliche Musikschule at Würzburg he began his career as a viola player in the Municipal Orchestra at Mayence, and at the early age of 20 became first viola at Bayreuth. He lived in Nelson, New Zealand, 1890-95. There he organized a symphony orchestra and a choral society. In 1896 he was made assistant conductor at Bayreuth, and two years later first conductor at the Stadttheater in Lübeck. In 1903 he succeeded Mottl as first conductor at the Opera and conductor of the symphony concerts in Karlsruhe. In 1906 he made a tour of Spain, conducting with such success that he was invited to direct *Tristan* and the entire *Ring* at Bayreuth. In 1911 he became conductor of the famous Hallé Orchestra in Manchester, but resigned at the outbreak of the War. From 1919 until his death he was first conductor at the Darmstadt Opera. In 1924 he once more conducted the *Ring*. He was editor of the monumental edition of Wagner's complete works begun by Breitkopf and Härtel in 1914.

**BALTIC PROVINCES** (Now **BALTIC STATES**). The name formerly applied to the Russian provinces of Courland, Esthonia, and Livonia, held by Germany during the War, and relinquished at the end of 1919. They now comprise two new republics: Esthonia (q.v.), formed out of the province of the same name and the northern part of Livonia; and Latvia (q.v.), formed out of Courland and the southern part of Livonia.

**BANCROFT, EDGAR ADDISON.** American lawyer and United States Ambassador to Japan, died at Tokio July 28. He was born at Galesburg, Ill., Nov. 20, 1857, and was educated at Knox College, receiving the degrees of A.B. in 1878, A.M. in 1881, and LL.D. in 1912. He studied law at the Columbia University Law School receiving the degree of LL.B. in 1880. After several years in general practice at Galesburg, he removed to Chicago in 1892, becoming solicitor for Illinois of the Atchison, Topeka & Santa Fe Railroad. In 1895, he became Vice President and General Solicitor of the Chicago and Western Indiana Railroad and the Belt Railway. In 1904, he became a member of the law firm of Scott, Bancroft, Martin & MacNeish. He was general counsel for the International Harvester Company from 1907 to 1920. He became known in Chicago for his unselfish

public spirit and interest in philanthropic movements. He was Republican presidential elector in 1888 and served as President of the Illinois State Bar Association and of the Chicago Bar Association. He was appointed Ambassador to Japan in 1924 and gained the esteem of that country, as one sincere and straightforward as well as courteous and tactful. His work contributed materially to the establishment of closer and friendlier relations between the people of Japan and the United States. At his death after a brief illness, the Japanese government among other marks of honor provided a war ship to convey his body home.

**BANDHOLTZ, HARRY HILL.** American soldier, provost marshal general in command of the Military Police of the American Expeditionary Force in the World War, died at Constantine, Michigan, May 7. He was born at Constantine, Michigan, Dec. 18, 1864, and graduated from the United States Military Academy in 1890. Commissioned 2nd lieutenant at graduation, and advancing through the regular grades he became major-general Nov. 3, 1923. He was professor of military science and tactics in the Michigan Agricultural College in 1896. In 1898 he served in the Santiago campaign with the 7th United States Infantry and later with the 2nd U. S. Infantry in the Philippine insurrection. From March, 1902 to April, 1903, he was governor of the Tayabas Province and in 1903 was appointed assistant chief of Philippine Constabulary in command of the District of Southern Luzon. From 1907 to September, 1913, he was chief of Philippine constabulary and was active in the elimination of banditry. In 1915 he was appointed major of the 30th U. S. Infantry, and served as chief of staff of the New York Guard division on the Mexican Border in the following year. At the outbreak of the World War he went to Camp Wadsworth with the 27th (New York) division, leaving this organization for France in the spring of 1918. After commanding the 58th infantry brigade he was made provost marshal general of the American Expeditionary Force in the World War on Sept. 27, 1918, serving until Aug. 5, 1919. The military police under him not only maintained order, but suppressed German spies inside the lines. He received the United States Distinguished Service medal, was made Commander of the French Legion of Honor, and received Belgian, Italian, Roumanian and Montenegrin Decorations. He was the American representative on the Interallied Military Mission to Hungary in 1919, was placed in command of the 13th Infantry Brigade Sept. 1, 1920, and a year later received command of the District of Washington. In 1921 he was active in the suppression of the Miners' Insurrection in West Virginia. He had served as a commander-in-chief of the Spanish War Veterans.

**BANERJEE, SIR SURENDRANATH.** Indian liberal leader and author, died August 6 at Barrackpore, Bengal. He was born in Calcutta, Nov. 10, 1848, and after graduating from the local Doveton College went to England to take examinations for admission to the Indian Civil Service, to which at that time only one Indian had secured admission. In the open competition of 1869, he was one of four successful Hindu competitors and in 1871 was sent to Bengal as a civil employee. In 1874 he was removed from the service after charges had

been made against him. It was believed that he had been severely treated in view of the condition of the Indian Civil Service of that date. In the following year he became professor in English literature at the Metropolitan Institution in Calcutta, and in 1876 he founded the Indian Association in Bengal, the precursor of the Indian National Congress of which Banerjee was twice president. In 1882 he founded Ripon College in Calcutta. For eight years he was a member of the Bengal Legislative Council, and from 1913 to 1920 a member of the Imperial Legislative Council. He was President of the Moderate Council in 1918, and was appointed a member of the Franchise Committee in connection with the Montagu-Chelmsford scheme of reforms for India in 1918. As early as 1879 when he took over the weekly paper, *The Bengali* he was active with his pen and particularly at the time of the anti-partition agitation. *The Bengali* in 1900 was turned into a daily and in 1925 he returned to its direction, amalgamating with it the *New Empire*, and the vernacular *Swaraj*. In 1919 he went to England as the head of the Moderate deputation which gave evidence before the Joint Parliamentary Committee on Indian reforms. In 1921 he became Minister in the Bengal Government in charge of local self-government and public health, and was created a knight. His service was concluded after three years by the success of the Swarajist element at the second General Election under the Reforms, and Banerjee devoted himself to preparing an autobiography entitled "A Nation in the Making, being the Reminiscences of Fifty Years of Public Life in Bengal," which was published by the Oxford University Press. Sir Surendranath Banerjee was considered not only the leader of the Liberal Party in Bengal, but the pioneer and father of Indian Nationalism, and was known as the Grand Old Man of Indian political life.

**BANKS AND BANKING.** See FINANCIAL REVIEW; NATIONAL BANKS.

**BAPTISTS.** In the United States in 1925 there were 18 bodies comprising that branch of the Christian Church known as Baptists and numerically they constituted the second largest Protestant group. The three main divisions of the church represented communicant members as follows: Southern Baptists Convention, 3,574,531; National Baptists Convention, 1,419,791; Northern Baptists Convention, 3,044,528. While the Baptist bodies trace their origin to the Protestant Reformation in the sixteenth century and churches were found in that period in Germany and Switzerland, the first Calvinistic Baptist Church was formed in London in 1638 and the First Baptist Church in America was probably established by Roger Williams in Providence, R. I., in 1639, though this honor is disputed by the First Baptist Church of Newport, R. I., organized the same year, or shortly after. As a result of political differences, and particularly the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptists Convention and since that time it has functioned, not as a new denomination, but as an organization for the purpose of directing missionary and general evangelistic work in the churches of the southern States. Likewise, a National Baptist conference representing the negro churches was

formed. In addition to the main body, other divisions early began to appear and these were known as "Primitive," "United," "General," "Free," etc. The church is congregational or independent as regards polity, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the church in which they hold membership. There are also various local associations. State conventions, State missions societies, State educational societies, etc.

The statistics for the Baptist churches in the United States and Canada in 1925 prepared by the *American Baptist Year Book* indicated that there were 59,452 churches, 2214 associations, and 48,702 ordained ministers, as compared with 59,053 churches, 2203 associations, and 48,439 ordained ministers in 1924. There were 336,808 baptisms during the year and a total church membership of 8,165,373. Sunday schools numbered 47,718 with an enrollment of 4,773,631. A total of \$77,234,271 was raised for all purposes, as compared with \$73,223,570 for the previous year. These figures were divided among the three main groups of the denominations as follows: The Northern Baptist Convention is composed of 38 State conventions, which reported 8797 churches, 433 associations, 9095 ordained ministers, 66,762 baptisms, 1,419,791 total church membership, 7696 Sunday schools, 1,130,027 enrollment, and \$33,568,616 contributions. 18 or more conventions comprise the Southern Baptist Convention, which had 27,517 churches, 986 associations, 19,525 ordained ministers, 209,676 baptisms, 3,574,531 church membership, 21,570 Sunday schools, 2,536,953 enrollment, and \$37,359,616 contributions; the National or Negro Conventions comprise 26 State groups, reporting 21,868 churches, 751 associations, 19,276 ordained ministers, 55,145 baptisms, 3,044,528 church membership, 17,275 Sunday schools, 996,566 enrollment, and \$3,984,552 contributions. The Convention of the District of Columbia coöperates with the Northern and Southern Conventions, and in the foregoing figures, has been included in the former. There are three conventions in the Dominion of Canada, which had 1295 churches, 45 associations, 841 ordained ministers, 5790 baptisms, 140,025 church membership, 1202 Sunday schools, 121,815 enrollment, and \$2,729,660 contributions. Of the total contributions during 1925, \$77,234,271, \$58,084,602 were devoted to current expenses, and \$19,149,669 to beneficence.

The denomination maintains 276 educational institutions, including theological seminaries, universities and colleges, junior colleges, academies, institutes, training schools, and Negro schools. The total enrollment in these institutions in 1925 was 83,476 students, of which 40,325 were male, and 43,151 were female; students for the ministry numbered 5850. There were 5217 instructors. In addition the denomination conducted, in 1925, 32 orphanages, 22 homes, and 36 hospitals. Extensive missionary work was conducted at home and abroad in 1925 through various societies and boards of the different conventions. Large staffs of workers were engaged in missions in India, Burma, China, Japan, the Congo, Philippines, and European countries.

In addition to several unorganized groups of foreign-speaking Baptists in North America, there are the following established and organized

bodies which hold their own conferences: German, Swedish, French-Speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Danish, Norwegian, Czecho-Slovak, Polish, Rumanian Baptist Association, Portuguese Baptist, and Russian Baptist Conference. The foreign-speaking bodies in 1925 had 915 churches, 917 ministers, and a church membership of 82,639. Smaller branches of the denomination, differing in various respects from the main branches of the church, include the following: Six-Principle Baptists (The International Old Baptist Union), Seventh-Day Baptists, Free Will Baptists, Colored Free Will Baptists, Free Will Baptists (Bullockites), General Baptists, Separate Baptists, Regular Baptists, United Baptists, Duck River Primitive Baptists (Progressive), Scandinavian Independent Baptists, and Two-See-In-The-Spirit Predestinarian Baptists. See Also BAPTISTS, FREE.

The denomination maintains several publishing houses, of which the American Baptist Publication Society is the chief. The official periodical of the Northern Baptist Convention is *The Baptist* (Chicago), of the National Baptist Convention, the *National Baptist Voice* (Nashville), while many sectional publications represent the Southern Baptist Convention.

The Baptist World Alliance was organized in 1905 and meets every five years; the last meeting was held in July, 1923, in Stockholm, Sweden. It is purely advisory in its relations to the Baptist churches and its purpose is discussion of interests common to the denomination. The following table prepared by the British *Baptist Handbook* for 1925, furnishes statistics of the denomination throughout the world in 1924.

	<i>Churches</i>	<i>Ministers</i>	<i>Members</i>
America .....	60,208	49,170	8,108,277
Europe .....	9,680	3,767	1,615,024
Asia .....	2,764	1,840	295,770
Africa .....	445	253	47,693
Australasia .....	416	350	31,850
Total .....	73,513	55,880	10,098,614

**BAPTISTS, FREE.** A branch of the Baptist denomination, which by 1925 had almost completed its policy of merging with the Northern Baptists Convention. During the year there was but little independent activity of the Free Baptists, yet there was still maintained a Free Baptists organization for legal purposes and for the embodiment of some sentiment. The majority of Free Baptist ministers, churches and members were included in the enumeration of the Northern Baptists Convention, with whose foreign and home missionary interests such activities of the Free Baptists had been consolidated. See BAPTISTS.

**BAR ASSOCIATION, AMERICAN,** Organized in 1878, this national association seeks to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. It had in 1925 about 22,000 members. At its annual meeting, held September 2-5, at Detroit, Mich., the following officers were elected: President, Chester I. Long of Wichita, former U. S. Senator from Kansas; Treasurer, Frederick E. Wadhams of Albany, N.

Y.: Secretary, William P. McCracken, Jr., of Chicago. One new member, Henry U. Simms of Birmingham, Ala., was elected to the Executive committee to replace Mr. Long. The outgoing president, Charles Evans Hughes, in the presidential address, spoke on "Liberty and the Law," and uttered a warning against religious and other intolerance in our legal system. Democracy, he said, had its own capacity for tyranny; majority rule must not be employed to destroy minorities, when such a course was not plainly essential to the interest of the entire public. Lord Buckmaster, former Lord Chancellor of England, spoke on salient figures and developments in legal history. Prof. Edson R. Suderland of the University of Michigan characterized American law procedure as behind the times, and wasteful of time and money. George W. Wickersham pleaded against erecting a pan-American international law system that might clash with that of the World Court. J. M. Mahnin, former judge of the U. S. District Court in the Virgin Islands, speaking before the judicial section of the meeting, alleged interference in the Islands, on the part of the Naval Government, in the Court determination of cases, and charged other infringements of justice. Charles Beecher Warren presented the legal aspects of our relations with Mexico. Secretary of State Frank B. Kellogg urged a liberal policy toward China. Manuel Fourcade, Bâtonnier of the Paris Bar, and Attorney-General John G. Sargent made addresses.

**BARBADOS.** An island colony of Great Britain, lying to the east of the Windward Islands; the most westerly of the Caribbean Islands. Area, 166 square miles; population (census of 1921) 156,312; estimated Dec. 31, 1923, 158,146. Capital and chief city, Bridgetown, 13,486. The average attendance at the primary schools in 1923 was 12,882 out of 21,030 enrolled. Movement of population in 1923 was: Births, 5921; deaths, 5868. The figures in pounds sterling for revenue, expenditure, imports and exports, and public debt for 1923-24 were as follows:

Revenue .....	444,646
Expenditure .....	420,461
Imports .....	2,531,882
Exports .....	2,189,740
Public debt .....	592,400

The principal imports were cotton manufactures, manures, flour, dried fish, machinery, salted beef, and wood shingles. The principal exports were sugar, molasses, rum, and raw cotton. In 1923 the leading countries of origin for the imports were: United Kingdom, £827,449; Canada, £603,628; United States, £494,220. In respect to destination of exports they were: United Kingdom, £427,677; Canada, £1,280,543; United States, £53,048. The administration is under a governor along with an executive council, an executive committee, a legislative council of nine members appointed by the King, and an assembly of 24 members, elected annually by the people. Governor at the beginning of 1925, Lieut.-Col. Sir C. R. M. O'Brien.

**BARBER, DONN.** American architect, died May 29 at New York. He was born at Washington, D. C., October 19, 1871, and graduated from Yale in 1893, taking later a special course

in architecture at Columbia University and gaining in 1898 a diploma at the Ecole des Beaux Arts in Paris. He returned to New York and up to the time of his death was active in the practice of his profession; his principal works in that city including the New York Cotton Exchange, the National Park Bank building, the Mutual Bank, the Lotos Club, the Institute of Musical Art, and the National Headquarters and the Central Branch building of the Y. M. C. A. Outside of New York he designed the Travelers' Insurance building, the Aetna Life Insurance building and Aetna National Bank of Hartford, and the Connecticut State Library. For the Department of Justice building in Washington, D. C., his design was selected in a government competition. He was one of the originators of the atelier idea in the United States and conducted such an institution from his own office. He was a member of the National Academy of Design and of the Society Beaux Arts Architects of which he was President in 1909-10. He was a fellow of the American Institute of Architects, a member of the Architectural League of New York, the National Sculpture Society, and an honorary corresponding member of the Royal Institute of British Architects.

**BARLEY.** As reported by the International Institute of Agriculture, Rome, the world's barley production in 1925, in countries other than Russia passed the pre-war average for the five years 1909 to 1913 by more than 8 per cent. Total production of these countries in 1925 was estimated at 1,204,399,000 bushels as against 1,015,671,000 bushels in 1924, the increase being about 18.6 per cent. Barley production of the leading countries in 1925, not including the United States and Russia, was as follows: Canada 113,100,000 bushels, Germany 111,647,000 bushels, Spain 98,911,000 bushels, Japan 80,067,000 bushels, and Poland 76,374,000 bushels. Argentina, the leading barley-producing country of the southern hemisphere, yielded 6,973,000 bushels in the harvest of 1924-25 and preliminary estimates placed the yield of 1925-26 at 12,420,000 bushels. The Soviet Republics, in 1925, according to provisional estimates, produced 243,435,000 bushels in their European and 31,141,000 bushels in their Asiatic territory.

The United States, as estimated by the Department of Agriculture, produced 218,002,000 bushels on 8,243,000 acres, as compared with 178,322,000 bushels produced on 6,858,000 acres in 1924. The average yields per acre were 26.4 and 26 bushels per acre respectively. The average farm price on Dec. 1, 1925, was 58.6 cents per bushel, and on that date the year before 73.9 cents. The leading barley-growing States and their yields, among 36 States reporting, were as follows: North Dakota 42,930,000 bushels, Minnesota 33,600,000 bushels, California 32,240,000 bushels, South Dakota 23,608,000 bushels, and Wisconsin 16,965,000 bushels. All other States produced less than 9,000,000 bushels. The average yield per acre by States ranged from 7.2 bushels in Texas to 48 bushels in Nevada, while in the principal producing States mentioned this range was from 22.5 bushels to 36.8 bushels. The average farm price in the different States on Dec. 1, 1925, was lowest in North Dakota with 43 cents per bushel and high-

est in North Carolina with \$1.20 per bushel. During the 5-year period preceding the World War the United States exported only 7,896,000 bushels of barley annually, but since that time the annual exports have averaged over 21,500,000 bushels. For the fiscal year ended June 30, 1925, the exports, not including barley flour, amounted to 23,650,000 bushels. The United Kingdom, during recent years, has taken approximately 75 per cent of barley exported from the United States; but during the fiscal year 1924-1925, Germany took about one-third of the quantity exported.

Barley is used largely for feeding purposes in European countries, taking the place of corn; but Great Britain, Germany and France use also large quantities for malting, although the quantities so used have shown a marked decline since the War. In the United Kingdom the average consumption of barley for malting purposes in 1923 and 1924 was less than two-thirds of the quantities used for this purpose during the three years immediately preceding the War. In the United States, before the enactment of the prohibition law, about 65,000,000 bushels of barley were used each year in the manufacture of distilled spirits, fermented liquors and cereal beverages, but the quantity now used annually, mainly in the preparation of cereal beverages, is only a little over 5,000,000 bushels.

**BARNARD AND GYE, CANCER RESEARCH WORK.** See CANCER.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BARRETT, KATE WALLER.** American sociologist, died February 24. She was born at "Clifton," Stafford County, Virginia, Jan. 24, 1858, and was educated at the Arlington Institute, Alexandria, Va., later completing a course in nursing at the Florence Nightingale Training School and St. Thomas' Hospital, London. She received the degree of Doctor of Medicine from the Medical College of Georgia in 1892, and in 1894 the honorary degree of Doctor of Science. In 1876 she married the Rev. Robert South Barrett of Atlanta. Interested in philanthropic work she spent her life largely in activities of a humanitarian character. She was vice-president and general superintendent of the National Florence Crittenton Mission in Washington from 1897 until 1909, when she was elected president. In 1909, she was a delegate to the Conference for the Care of Delinquent Children, and later president of the National Council of Women, and four times delegate to the International Council of Women. In 1914 she was appointed the special representative of the United States to investigate conditions surrounding women in Europe. She served, 1917-19, on committees dealing with war activities, and in 1919 was a delegate to the National Peace Conference at Zurich as well as a special representative of the Bureau of Immigration to Europe. She was State Regent for Virginia in the Daughters of the American Revolution, 1918-22, honorary president for life of the National Council of Women, and a member of the board of visitors to the College of William and Mary. In 1923 she was national president of the American Legion Auxiliary.

**BARTLETT, PAUL WAYLAND.** American sculptor, died at Paris, September 20. He was

born at New Haven, Conn., in 1865, his father, Truman Howe Bartlett, being a sculptor and art critic. At 15 years of age he studied sculpture in Boston under Frémiet and later, at Paris, with Cavelier in the Ecole des Beaux Arts. As a mere youth he exhibited at the Paris Salon and was at first interested in animal sculpture, studying the various animals on exhibition at the Jardin des Plantes and learning animal anatomy. Among his famous pieces of this period are the "Dying Lion" and the "Bohemian Bear Tamer" which received honorable mention in the Salon of 1887, and later found a permanent home in the Metropolitan Museum of Art. As he matured his work broadened and his technical method improved. He essayed equestrian figures. These include the statue of General McClellan in Fairmount Park, Philadelphia and the equestrian statue of LaFayette placed in the Tuileries Garden, Paris, which was presented by the school children of the United States to France. His statue of Columbus in the Congressional Library at Washington is said to be of his best work, while his Michelangelo, also in the Congressional Library, is of merit and charm. He executed six large marble statues for the façade of the New York Public Library, a bronze statue of Benjamin Franklin erected in Waterbury, Conn., and a colossal stone statue, "Patriotism," placed at Duluth, Minn. A notable work was a pediment group for the House of Representatives' wing of the National Capitol entitled "Peace Protecting Genius," composed of 12 colossal figures, the whole said to represent a combination of realism and symbolism which characterized his later work. Bartlett was elected to the American Academy of Arts and Letters in 1917, but he lived and worked extensively in Paris. He was chosen an officer of the Legion of Honor of the Institut de France in 1908 and in 1913 he was appointed director of sculpture in the Glasgow School of Fine Arts. Bartlett's work in addition to the examples mentioned is found in many of the American galleries, and he was considered one of the best of American sculptors. He lived abroad and expressed the French tradition in much of his work.

**BARTLETT, WILLARD.** An American jurist, former chief judge of the Court of Appeals, died January 16. He was born at Uxbridge, Mass., Oct. 14, 1846, and was educated at New York University and Columbia College, graduating in law from the former institution in 1868. From 1869 to 1883 he practiced law in association with Elihu Root in New York City, and in 1884 became a Justice of the Supreme Court of the 2nd Judicial Department of N. Y. He was Justice of General Term of the Supreme Court of N. Y. C. 1887-89, and Justice of the Appellate Division of the Supreme Court of Brooklyn, 1896-1906. He was Associate Judge of the New York State Court of Appeals, 1906-14, and its Chief Judge 1914-16, when he was retired by age. In 1917 he resumed the practice of law as counsel in association with his former partner, Elihu Root. Judge Bartlett was a Democrat in politics and a man of high legal attainments as well as literary ability. At one time he was dramatic critic to the New York Sun and frequently contributed articles on legal topics and book reviews. He was professor of medical jurisprudence at Long Island College

Hospital, 1898-1916, and a member of many professional and social organizations, being President of the Long Island Historical Society and a fellow of the American Academy of Arts and Sciences.

**BASEBALL.** Professional baseball maintained its hold as America's national game in 1925, a season marked by large attendance reaching its climax in the World Series between the Pittsburgh Pirates of the National League and the Washington Senators of the American League. These championship games drew a total of 282,830 spectators and the receipts aggregated \$1,182,854, breaking all previous records in this respect. The Pittsburgh Pirates eventually emerged with the championship laurels after a struggle that required the playing of the full quota of seven games. The Senators captured the first game with their great Walter Johnson officiating on the mound, but the Pirates evened matters by winning the second contest through the magnificent pitching of Victor Aldridge. The Senators took the third and fourth games and apparently had the championship as good as won. The Pirates, however, staged a wonderful rally and upset all prognostications by capturing the final three games and with them the world's title.

The statistics of the world series games follow:

First game, Senators, four runs, eight hits, one error; Pirates, one run, five hits, no errors. Batteries, Johnson and Ruel; Meadows, Morrison and Smith, Gooch.

Second game, Senators, two runs, eight hits, two errors; Pirates, three runs, seven hits, one error. Batteries, Coveleskie and Ruel; Aldridge and Smith.

Third game, Senators, four runs, ten hits, one error; Pirates, three runs, eight hits, two errors. Batteries, Ferguson, Marberry and Ruel; Kremer and Smith.

Fourth game, Senators, four runs, twelve hits, no errors; Pirates, no runs, six hits, one error. Batteries, Johnson and Ruel; Yde, Morrison, Adams and Gooch.

Fifth game, Senators, three runs, eight hits, one error; Pirates, six runs, thirteen hits, no errors. Batteries, Coveleskie, Ballou, Zachary, Marberry and Ruel; Aldridge and Smith.

Sixth game, Senators, two runs, six hits, two errors; Pirates, three runs, seven hits, one error. Batteries, Ferguson, Ballou, Severid and Ruel; Kremer and Smith.

Seventh game, Senators, seven runs, seven hits, two errors; Pirates, nine runs, fifteen hits, two errors. Batteries, Johnson and Ruel; Aldridge, Morrison, Kremer, Oldham and Smith.

The most conspicuous player of the year was Rogers Hornsby, manager of the St. Louis Cardinals of the National League. He topped the batters in his league for the sixth consecutive season, thereby setting a new record, his average being .403. Hornsby was named the most valuable player of his league by the committee of writers chosen to make the selection. Roger Peckinpaugh of the Washington Senators was chosen as the most valuable player in the American League. Tyrus Raymond Cobb celebrated his twentieth anniversary as a member of the Detroit Tigers and Harry Heilmann of the same team won the premier batting honors in the American League for the third successive year.

"Babe" Ruth once more attracted a large share of popular attention, not, however, because of the brilliancy of his playing. The "Babe" had a bad season, with a serious illness which kept him out of the game for many weeks, and later his suspension and \$5000 fine imposed by Manager Miller Huggins of the New York Yankees for Ruth's failure to obey the Club's training rules.

Several men long prominently identified with baseball died during the year, among them being Christopher Mathewson, the famous pitcher, Charles H. Ebbets, president of the Brooklyn National League, Edward J. McKeever, vice-president of the same club, John M. Ward, old-time player, and Frank Chance, well-known manager.

The final standing of the clubs in the National League was: Pittsburgh won 95, lost 58; New York won 86, lost 66; Cincinnati won 80, lost 73; St. Louis won 77, lost 76; Boston won 70, lost 83; Brooklyn won 68, lost 85; Philadelphia won 68, lost 85; Chicago won 68, lost 86.

The final standing of the clubs in the American League was: Washington won 96, lost 55; Philadelphia won 88, lost 64; St. Louis won 82, lost 71; Detroit won 81, lost 73; Chicago won 79, lost 75; Cleveland won 70, lost 84; New York won 69, lost 85; Boston won 47, lost 105.

Among college baseball teams Holy Cross and the University of Pennsylvania made the best showings, both playing through long schedules with but few reverses.

**BASKETBALL.** Washburn College of Topeka, Kan., won the national Amateur Athletic Union basketball championship in 1925, by defeating the Hillyards of St. Joseph, Mo., in the final game, 42 to 30. Princeton University captured the Eastern intercollegiate honors, winning nine of the ten games played. Dartmouth, Pennsylvania and Columbia tied for second place in the rating with six victories and four defeats each. The championship of the Western Conference colleges went to Ohio State University which won 11 games and lost one. In a post-season contest Princeton triumphed over Ohio State. The Passaic N. J. High School five, after winning 159 straight games in six seasons finally went down to defeat on Feb. 6, 1925. The leading professional team of the year was the Original Celtics of New York who won 100 games and lost only six. Toward the close of 1925 a new professional basketball league was organized to be known as the American League with the following teams enrolled: Boston Whirlwinds, Brooklyn Arcadias, Rochester Centrals, Washington Palace, Buffalo Germans, Rosenblums of Cleveland, Fort Wayne Knights of Columbus, Schulte Realty Company of Detroit, Chicago Bruins and East Liverpool Panthers. A schedule of 36 games will be played.

**BATES COLLEGE.** A non-sectarian coeducational institution of higher education at Lewiston, Me.; founded in 1864. For the 1925 fall term there were 623 students, including three graduates, and with their exception, the total was apportioned as 344 men, and 276 women. The enrollment for the 1925 summer session totaled 231, of which 130 were men, and 101 women. There were 30 members on the faculty. In 1925 a campaign was in progress for raising money to build a gymnasium. A new department of instruction, that of the department of music with Prof. Seldon T. Crafts at the head, was installed in 1925, and courses in appreciation of music, and its history were offered, besides supervision of all college musical activities. During the year the construction of a new indoor athletic building, a \$150,000 gift from William Bingham, 2nd, of Bethel, Me., was started extending over 160 square feet of surface. This building provided facilities for practice to both men and women students in

sports played on dirt surface as well as a board running track suspended in the air. The productive funds amounted to \$1,662,781.13, and the income \$203,225.91. There were 52,261 volumes in the library. President, Clifton Daggett Gray, Ph.D., LL.D.

**BAUXITE.** In 1924 the bauxite produced in the United States amounted to 347,570 long tons, valued at \$2,137,990, as compared with 522,690 long tons, valued at \$3,156,610 in 1923. The greater part of this production came from Arkansas, which in 1924, supplied 327,630 long tons, valued at \$1,981,000, Georgia, Alabama, and Tennessee the remainder. While the production declined in 1924, the imports principally from British and Dutch Guiana increased, amounting to 201,974 long tons, valued at \$909,493, as compared with 119,020 long tons, valued at \$593,882, in 1923. The exports of bauxite in 1924, including bauxite concentrates, amounted to 77,065 long tons, valued at \$3,979,832. Bauxite is the ore of aluminum (q.v.) and is used for aluminum, aluminum salts, abrasives, and refractory materials. Considerable bauxite was being used in a new fast-setting cement. The reduction of bauxite to metallic aluminum was carried on in the vicinity of Niagara Falls and at Messina, N. Y., Badin, N. C., and Alcoa, Tenn.

**BAVARIA.** A constituent state of the German republic with a republican form of government since Nov. 22, 1918; formerly a kingdom within the German Empire, ruled for more than a century by the Wittelsbach dynasty, which was deposed after the revolution following the war. Area, 30,562 square miles; population at the last census (1919), 7,140,340. Chief cities: Munich with a population of 630,711; Nuremberg, 352,675; and Augsburg, 154,555. According to the 1919 census, 46 per cent of the population lived in towns and rural communes with a population of more than 2000. In 1923 there were 173,092 living births, 4793 still births, 111,610 deaths, and 59,381 marriages. The last religious census taken in 1910 showed 4,862,233 Roman Catholics, 1,912,262 Protestants, and 55,065 Jews. Education is compulsory between the ages of six and 16. According to the latest available statistics there were 7449 public schools, with 4297 teachers and 1,052,659 pupils. In 1923 the chief crops with their areas and yields were as follows: Wheat, 517,543 acres and 393,657 metric tons; rye, 1,048,910 acres and 653,752 tons; oats, 1,072,460 acres and 611,977 tons; potatoes, 912,765 acres and 3,472,613 tons; vines, 51,132 and 24,912,138 gallons; hops, 25,087 acres and 2725 tons. Livestock, Oct. 10, 1923: cattle, 3,575,031; sheep, 725,770; pigs, 1,991,188; goats, 506,581. In 1923 the mineral output was as follows: Coal, 2,629,113 metric tons; iron ore, 468,336 tons; pig iron, 227,386 tons; cast iron ware, 94,567 tons; sulphuric acid, 13,033 tons.

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by a diet of one chamber elected for four years on a basis of universal, equal, direct, secret, and proportional

suffrage, all citizens over 21 years of age having the right to vote. The various parties represented in the Bavarian National Constituent Assembly, elected in April and May, 1924, were as follows: People's Party, 46; Centre, 11; Farmers' Party, 10; Democrats, 3; Christian Social Centre, 3; National Liberal, 1; Bureau-cratic Party, 1; Völkischer Bloc, 23; United Social Democrats, 23; Communists, 9. The ministry at the beginning of 1925 (constituted July 2, 1924) was as follows: Premier and Minister of Foreign Affairs, Herr Held; Minister of Education, Dr. Matt; Minister of Commerce and Industry, Herr Schmidt; Minister of Social Welfare, Herr Oswald; Minister of Agriculture, Professor Fehr; Minister of Interior, Herr Steutzel; Minister of Finance, Dr. Krausneck; Minister of Justice, Herr Gürtner.

**BAYNES, ERNEST HAROLD.** American author and lecturer on animal life, died January 21. Born at Calcutta, India, May 1, 1868, he was educated at the College of the City of New York and in 1891-92 was a reporter on the *New York Times*. From 1893 to 1900 he was assistant to his father who had invented a process for photographic modeling. In 1900 he began writing and lecturing on natural history. He produced *Wild Life in the Blue Mountain Forest*, published in 1904, which was followed by many other contributions. In addition to his writings on natural history he was active in forming various organizations such as the Meriden, N. H., Bird Club, designed to afford a sanctuary for birds, free from hunting and molestation. He organized 200 similar clubs and took an active part in various humane movements. In 1919 he visited Europe, Egypt, and Palestine to prepare articles on the part played by animals in the great War. He engaged in the anti-vivisection controversy, maintaining that experimentation on animals was necessary for the health and longevity of men and animals. He was the author of *Wild Bird Guests* (preface by Theodore Roosevelt) (1915); *Polaris—The Story of an Eskimo Dog* (1922); *Jimie—The Story of a Black Bear Cub* (1923); and lectured before the Lowell Institute, Boston, on "Our Animal Allies in the World War."

**BAYREUTH FESTIVAL.** See MUSIC.

**BEAUCHAMP, WILLIAM MARTIN.** American clergyman and archaeologist, died December 13, at Syracuse, N. Y. He was born at Coldenham, N. Y., Mar. 25, 1830, and in his infancy was taken with his family in a pioneer wagon to Skaneateles where he studied at the Academy and in 1862 graduated from the Delancey Divinity School of Hobart College. He was ordained deacon in 1862, and priest in 1863, serving as rector at Northville, N. Y. and at Baldwinsville, N. Y. He was examining chaplain for the Diocese of Central New York, 1884-1921, and president of the Syracuse Clericus, 1905-17. He was widely known as the leading historian and archaeologist of Central New York, being an authority on the customs, folklore, and languages of the New York State Indians. He was archaeologist of the New York State Museum, a member of the American Folk-Lore Society, vice-president of the Onondaga Historical Association, and president of the Onondaga Academy of Science. Among his many works were: *Iroquois Trail* (1892); *Indian Names of New York* (1893); *Shells of Onondaga County, N. Y.* (1896); *History of the New York Iroquois, now*

*Commonly Called the Six Nations* (1905); *Past and Present Syracuse and Onondaga County* (1908); *Revolutionary Soldiers of Onondaga County*, N. Y. (1913); *Moravian Journals in Central New York*; *Iroquois Folk Lore* (1921); and also archaeological bulletins of New York State Museum.

**BEAUNIER, ANDRÉ.** French writer and literary critic, died December 10. He was born Sept. 22, 1869, at Evreux; studied at the Lycée Henri IV, and at the École Normale Supérieure. He was a *Agrégé des lettres* and an officer of the Legion of Honor. He wrote literary critiques for the *Revue des Deux Mondes* and was dramatic critic for the *Echo de Paris*. His first work of note was a novel, *Les Dupont-Leterrier* (1901); and was followed by more than 30 books of romance, history, literary research and drama, including among his more recent publications *La Jeunesse de Mme. de La Fayette* (1921); *Suzanne et le Plaisir* (1921); *Joseph Joubert, lettres à Mme. de Vintimille* (1921); *La folle jeune fille* (1922).

**BEAUX-ARTS INSTITUTE OF DESIGN.** A school of fine arts in the City of New York, planned after the École des Beaux Arts in Paris, organized in 1916 by the Society of Beaux-Arts Architects to carry on educational work. It has its headquarters at 126 East 75th Street, New York City, where it offers courses in architecture, sculpture and life drawing, mural painting and interior decorating. The Institute awards the Paris Prize of \$3000. of the Society of Beaux-Arts Architects for two and one half years' study in architecture at the École des Beaux Arts in Paris. In 1925 the officers of the institute were: Acting director, Whitney Warren; secretary and treasurer, Henry R. Sedgwick; dean, Edmund S. Campbell; executive secretary, Fred F. Clarke. Benjamin Wistar Morris was chairman of the board of trustees, and Henry R. Sedgwick was secretary and treasurer.

**BEDFORD, ALFRED COTTON.** For many years identified with the American petroleum industry, and chairman of the board of directors of the Standard Oil Company of New Jersey, died September 21. He was born in Brooklyn, N. Y., Nov. 5, 1864, and received his education at Adelphi Academy and in England, Germany, and Switzerland. He began his commercial life as a clerk with a wholesale dry goods firm in New York City. Apr. 9, 1882, he became connected with the Bergenport Chemical Company, a subsidiary of the Standard Oil Company. He became general manager of that company and later general representative of Charles Pratt & Company. In 1907 he was made a director of the Standard Oil Company of New Jersey, becoming treasurer in 1910, vice-president in 1911, president in 1916, and chairman of the board of directors, Nov. 15, 1917, a position he held at the time of his death. During the World War he was chairman of the petroleum committee of the Council of National Defense, and later vice-president and chairman of the executive committee of the Chamber of Commerce of the United States. He was vice-president of the Chamber of Commerce of the State of New York, and chairman of the American committee of the International Chamber of Commerce. He was interested in many philanthropic movements in Brooklyn, being a director of the Brooklyn Y. M. C. A., a member of the council of Pratt

Institute, and president of the board of trustees of Emmanuel Baptist Church, Brooklyn, N. Y.

**BEEF.** See LIVESTOCK.

**BETTERIES.** See ENTOMOLOGY, ECONOMIC.

**BEGIN, CARDINAL LOUIS NAZAIRE.** Primate of the Roman Catholic Church in Canada, died July 19 at Quebec. The son of a farmer he was born Jan. 10, 1840, at Sarosta in the parish of Levis, across the river from Quebec, and was educated at the Levis Model School, the Collège of St. Michel Bellechasse, the Little Seminary of Quebec, and Laval University, Montreal. He then studied theology at the Grand Seminary, Quebec, and after attending the lectures of the Jesuits at the Gregorian University, Rome, in 1865 was ordained and made doctor of divinity. After further studies in Rome, at Innsbruck and in the Holy Land he returned to Canada in 1867, taught at Laval University, the Little Seminary, Quebec, and became successively director of the Grand Seminary and principal of the Laval Normal School. In 1888 he was appointed Bishop of Chicoutimi. Three years later he was appointed Bishop Coadjutor to Cardinal Taschereau, Archbishop of Quebec, and became titular Archbishop of Cyrene. He succeeded to the archbishopric on the death of Cardinal Taschereau in 1898. In 1914 he was created Cardinal by Pope Pius X. He was known as an able administrator and strict ecclesiastical disciplinarian earnest in enforcing the regulations of the Roman Catholic Church. He was an active opponent of social modernism and of the liberal conventions which had developed since the War in social life. He took particular interest in the working classes, frequently acting as arbitrator in labor disputes. He was a fellow of the Royal Society of Canada and the author of many religious works.

**BELGIAN CONGO.** See CONGO, BELGIAN.

**BELGIAN FELLOWSHIPS.** See UNIVERSITIES AND COLLEGES.

**BELGIUM.** A kingdom of western Europe, situated between France and the Netherlands. Capital, Brussels.

**AREA, POPULATION, ETC.** The total area, including the districts of Eupen and Malmédy, 11,752 square miles. The population, according to the census of Dec. 31, 1920 was 7,465,782; estimated Dec. 31, 1923, 7,666,055, which represented a population of 652 to the square mile. The chief cities with their estimated populations on Dec. 31, 1923, were: Brussels with suburbs, 787,060; Antwerp, 300,677; Liège, 165,090; Ghent, 163,877. In 1923 the movement of population was: Births, 155,484; deaths, 100,177; increase of births over deaths, 55,307; marriages, 79,786; divorces, 3253. The emigrants in 1923 numbered 31,090 and the immigrants, 34,744.

**EDUCATION.** There were four universities, viz. the state universities at Ghent (1241 students in 1921-22) and Liège (2350 students) and the free universities at Louvain (3244 students) and Brussels (2201 students). In 1923 Ghent was transformed into a Flemish institution after a long political quarrel. In the same year the Colonial School at Antwerp and the School of Tropical Medicine were constituted a Colonial University. There were besides various agricultural, technical, and normal and art institutions. In 1922 there were 8116 primary schools, with 910,757 pupils; 3430 infant schools

with 158,617 pupils; and 2947 adult schools with 99,341 pupils. There are six normal schools for training secondary teachers (384 students) and 78 for training elementary teachers (10,578 students).

**PRODUCTION, MINERAL RESOURCES, ETC.** Nearly two-thirds of the total area of Belgium, or 1,763,200 hectares are cultivated for agricultural purposes, and of this, about 675,000 hectares are under cereal crops and 724,000 in pasturage. The prevalent mode of culture is by small holdings, about 450,000 farmers having under cultivation tracts averaging about an acre, and not more than 283,000 cultivating areas of 2½ acres. The accession, as a result of the Treaty of Versailles, of the cantons of Eupen and Malmédy added 100,000 hectares to the arable area of Belgium. Owing to the extreme density of the population of Belgium, Belgium being the most densely populated country in Europe, native agriculture is inadequate to the country's need, and grains form one of the chief articles of import. The accompanying figures from the *Statesman's Year Book* for 1925 show the acreage and yield of the principal crops for 1923:

Crop	Acreage		Produce in	
	1923	1923	cwts.	1923
Wheat .....	349,535		7,280,596	
Barley .....	85,728		1,820,956	
Oats .....	661,773		13,680,572	
Rye .....	580,065		10,580,356	
Potatoes .....	381,163		2,822,212 *	
Beet (sugar) .....	181,150		2,086,518 *	
Tobacco .....	4,972		86,200	

\* Tons.

For further details in regard to agriculture see article on **AGRICULTURE**, table of production by countries; also **AGRICULTURAL EXTENSION WORK**. On Dec. 31, 1923, the livestock numbered as follows: Horses, 243,184; horned cattle, 1,602,728; pigs, 1,176,430.

The most important industries in Belgium are artificial silk, motor cars, glass, iron and steel, lace, linen, and gloves. Mineral production has always been an important item in Belgium. The country has natural resources of coal and zinc and after the economic union with Luxembourg in 1922 gained ready access to supplies of iron ore. The accompanying tables from the *Statesman's Year Book* of 1925 show the production of coal and coke, iron and steel, and crude zinc for 1922 and 1923:

Year	Coal	Briquettes	Coke	Work-people
1922.....	21,208,500	2,497,350	3,099,988	159,137
1923.....	22,922,340	1,929,260	4,179,964	166,779

Products	1922 Tons	1923 Tons
Pig-iron .....	1,608,620	2,188,128
Wrought iron .....	180,252	207,732
Steel .....	1,409,990	2,285,892
Wrought steel .....	1,563,640	1,933,380
Crude zinc .....	112,290	147,040

The pig iron was valued at 797,461,000 francs in 1923; the wrought steel at 1,335,235,000 francs; and the zinc at 415,080,000 francs. In the same year 51,100 tons of lead were mined.

**COMMERCE.** The following summary of Belgium foreign trade in 1924 was supplied by the United States Bureau of Foreign and Domestic Commerce: Belgian foreign trade during 1924 showed that progress had been made in reducing the large excesses of imports that have characterized Belgian trade balance since the armistice. While so-called trade deficit was normal for the country prior to 1914, the relatively small proportion of exports to imports in 1919, 1920, 1921, and 1922 was disquieting. In 1923, however, the pre-war ratio was recovered and in 1924 it was surpassed. Any opinion as to whether this progress can be maintained is hazardous, nevertheless, since growth of Belgium's exports has undoubtedly found its fundamental causes in declining exchanges during 1923 and early 1924. As internal price levels adjust themselves to the exchange value of the franc, Belgian ability to maintain a favorable ratio between exports and imports must be based on production advantages—cheap labor, longer working hours, technical improvements, and concerted selling agreements—many of which do not yet appear in the Belgian industrial situation.

The most significant trade index to Belgian prosperity is found in relation of exports of manufactured goods to imports of like nature. Owing to absence of native raw materials, Belgium must always incur a heavy debt in maintaining operation of her industries. Excess exports of manufactured goods cancel in part this debt, and their increase or decrease reflects the situation of Belgian industry. Comparative figures for years since the armistice and for 1913 illustrate the progress made in increasing the proportion of exports.

The figures given above for 1913 call for some explanation. In that year there were imported 388,486,000 francs in silver coins, and their export aggregated 71,055,000 francs. If we deduct these amounts from total exports and imports, since they do not represent pure commercial operations, the final trade figures become: Imports, 4,661,373,000 francs; exports, 3,637,759,000 francs. The proportion of exports to imports thus increases to 78 per cent, at which point it is still below that attained in 1924. Further evidence of improvement in the Belgian trade-balance situation is revealed when statistics are reduced to a gold basis. The total trade then shows a decline from the pre-war situation, but the excess of imports over exports exhibits an encouraging reduction from 1,026,614,000 gold francs in 1913 to 866,908,000 gold francs in 1924.

Trade statistics of Belgium indicated in paper francs are obviously vitiated by fluctuations in value of this currency. Computation in gold

#### BELGIAN FOREIGN TRADE FOR 1924, BY QUANTITY AND VALUE OF COMMODITY GROUPS

Commodity group	Imports		Exports	
	Metric tons	1,000 francs (paper)	Metric tons	1,000 francs (paper)

Total.....	4,661,373	4,177,270	3,637,759	3,810,362

ances are unsatisfactory in that the exchange rate applied is an average rate throughout the year, while ebb and flow of trade movements generally follow increase and decrease in the value of the franc. On the other hand, measurements in quantity (metric tons in the case of Belgium) involve a constant factor. Nevertheless, it must be remembered that Belgium imports necessarily involve raw materials, or heavy items, while exports are finished, or lighter, goods. For a given increase in exports, therefore, there must be a proportionately greater increase in imports. These quantity statistics show that exports have nearly reached their pre-war level. Imports are slightly in excess. Study of these figures, together with those given above and showing exports and imports measured in terms of gold francs, reveals the fact that Belgium, even under most unfavorable interpretation, has regained its pre-war commercial situation. Moreover, the excess of imports has undoubtedly decreased. The figures given above are those of the actual trade balance of Belgium, as shown by official statistics; but Belgian international payments could no doubt approximately balance if all invisible items were available, since these are favorable. The total value of Belgian foreign investments is estimated at approximately 11,000,000 francs, and foreign participation in Belgian enterprises, based on banking transactions, amounts to approximately 8,500,000,000 francs. Invisible assets are probably of sufficient importance to effect a final balance of international accounts without recourse to speculative credits.

FINANCE. The ordinary revenue in 1925 was 268,007,488 francs and the ordinary expenditure, 4,247,000,000 francs. According to the United States Bureau of Foreign and Domestic Commerce the ordinary receipts in the budget estimates for 1926 total 5,326,000,000 francs, while expenditures in the same category reach 123,000,000 francs, with a surplus of 3,000,000 francs. This balance has been obtained by the transfer of 200,000,000 francs of receipts from a recoverable budget to meet charges on reconstruction loans. In the extraordinary budget there was still a deficit of 186,000,000 francs and in the recoverable budget one of 143,000,000 francs, making a net deficit for all three categories of 317,000,000 francs as compared with

491,000,000 francs in the same three sections of the 1925 budget. Expenditures in the ordinary budget for 1926 are 1,076,000,000 francs in excess of those for 1925, as a result of salary adjustments to the decline in franc value, increased external debt charges, the passage of social insurance acts, higher internal prices, and the estimated annual charge of 240,000,000 francs on the proposed stabilization loan.

Among the leading items of expenditure were service on the public debt, including pensions and similar charges, in the amount of 2,734,000,000 francs, as compared with 1,829,000,000 francs in the 1925 budget; national defense, 590,000,000 francs in the ordinary budget and 90,000,000 francs in other budgets, making a total of 680,000,000 francs, as compared with 777,000,000 francs in the 1925 budget; Ministry of Science and Arts, 420,000,000 francs for the ordinary budget as against 321,000,000 francs in 1925; and for the Ministry of Industry and Labor, 285,000,000 francs, as against 196,000,000 in the previous budget. A distinctive feature of the new budget is the elimination of the category "unspecified," thus making it impossible to exceed credits without further parliamentary authorization. On the administrative budget the government monopolies, including railways, posts, telegraphs and telephones, showed a slight deficit, with expenditures of 2,345,000,000 receipts and 2,328,000,000 expenditures. The extraordinary budget for monopolies showed expenditures of 443,000,000 francs, a decrease of 138,000,000 francs, as compared with 1925, not counterbalanced by receipts.

The total public debt on Sept. 30, 1925, amounted to 45,780,000,000 francs, 65 per cent of which was consolidated and 35 per cent floating debt. A year earlier the total was only 40,684,000,000 francs. This increase was confined largely to the external debt; internal categories totaled 31,855,000,000 francs as compared with 30,932,000,000 francs on Sept. 30, 1925, while the external debt had advanced to 13,925,000,000 francs as compared with 9,752,000,000 francs. This advance was due in part to the reduced exchange value of the Belgian franc which was quoted at 4.9 cents on Sept. 30, 1924, and at 4.4 cents on the corresponding date of 1925.

COMMUNICATIONS. On Jan. 1, 1924, the Belgian merchant fleet was composed of 321 ships

392,674 tons. In 1923, 13,806 vessels of 17,49,334 tons entered the ports of Belgium and 1,708 vessels of 20,304,490 tons cleared. On Dec. 31, 1923, the line mileage of the Belgian railways included 2981 miles operated by the state or government railways and 171 miles operated by private companies. In addition there were 2770 miles of narrow gauge lines. GOVERNMENT. Belgium is a constitutional monarchy. Executive power is in the king, acting through a responsible ministry; legislative power in the king and the two chambers, namely the senate and chamber of representatives. The premier is elected partly by the direct and partly by the indirect vote of the people, the number elected being equal to half the number of members of the lower house and proportioned to the population of each province. Those elected indirectly are chosen by the provincial councils. The 186 members of the chamber of representatives are elected directly for four years. See *History*, below. The reigning monarch at the beginning of 1925 was Albert, who succeeded his uncle, Leopold II, Dec. 17, 1909.

### HISTORY

PARLIAMENTARY. ELECTIONS. A parliamentary crisis occurred in the early months of the year with the result that a dissolution of the legislative body was announced and new elections took place on April 5. The regular elections would have occurred in May, but the ministerial crisis was such that they were moved forward a month. The trouble arose over the question of granting the ballot to women. In January the Catholic deputies, supported by a group of Socialists, demanded that woman suffrage be granted. The Liberals under the leadership of Premier Theunis opposed the measure on the grounds that it was outside of the field of activity for which the Theunis Liberal-Catholic ministry had been organized. The cabinet was about equally divided on the issue as was the legislative body. In some quarters it was stated that the opposition to the measure was in large part due to a feeling that if the vote were granted to women they would be unduly influenced by the radical party. This was stoutly denied by the Catholic party, but the rumor continued to persist throughout the discussion.

The results of the elections held on April 5 showed a surprising victory for the Socialists. They would be the strongest group numerically in the new chamber, their number increasing from 68 to 79. The election was a very quiet affair on the whole, the people showing a general apathy, probably because of the absence of a vital issue. The Catholics lost two seats and the Liberals 11. The Communists who were not represented in the preceding parliament succeeded in gaining two seats and the Flamings gained six seats as compared with four in the dissolved parliament. The senate returns showed 71 Catholics as compared with 73, 28 Liberals as compared with 28, and 59 Socialists against 52. Although no one group had a majority, the system of proportional representation indicated a great increase in the Socialist vote and therefore practically forced the resignation of Premier Theunis in order to give Emile Vandervelde, the leader of the Socialists, an opportunity to form a cabinet. Theunis tendered his resignation but the King asked

him to retain his post until a new cabinet was formed. With one or two changes the Theunis cabinet had been in power since December, 1921.

The problem of forming a new ministry was a difficult one and was not satisfactorily solved for weeks. The King offered the post to Emile Vandervelde. The General Council of the Socialist Party decided to hold a congress to determine the action of the party. After a period of deliberation Vandervelde informed the King that he could not form a ministry because the Socialists were not sufficiently strong themselves and efforts to form a coalition with the Flemish Catholics had failed. Thereupon the King requested Aloys Van de Vyvere, a prominent financier and statesman, to form the cabinet. He was successful in forming a coalition group which lasted only a few days and which handed in its resignation on May 22. On June 3 Viscount Poulet, who had been Minister of the Interior in the Theunis government, succeeded in forming a coalition government comprising Socialists and Catholics. His cabinet only lasted one day, however, and resigned on June 12, when parliament voted a lack of confidence. It is interesting to note that throughout this entire period of uncertainty the life of the people went on at a normal rate. They seemed to realize that it was merely politics that were at stake and not economic conditions. The functions of government were carried on efficiently by the retiring ministry and the permanent officials.

By June 17 the opposition to Poulet apparently subsided and he announced a coalition cabinet, including five Socialists, five Catholics, and two Liberals. It was made up as follows: Premier and Minister of Economic Affairs, Viscount Poulet; Foreign Affairs, Emile Vandervelde; Agriculture, Count de Liedekerke; Railways, R. Edouard Anseele; Colonies, Senator Carton; National Defense, General Keston; Finance, Albert Janssen; Industry, Charles Wauters; Interior, M. Poulet; Justice, M. Tschoffen; Sciences and Art, Camille Huysmans. On July 2 the Chamber of Deputies gave the new cabinet a formal vote of confidence, 123 to 37. Just before parliament adjourned on August 5 the Senate by a vote of 71 to 56 defeated the proposal to grant suffrage to women, the rock on which the Theunis cabinet had split. When this vote was taken the Socialists voted against the measure, although previously they had united with the Catholics in its support.

THE FLEMISH QUESTION. The Flemish problem continued to be acute throughout the year. In July the Burgomaster of Alost was dismissed for hauling down the Belgian national flag from his town hall and replacing it with the emblem of the Flemish nationalists. His dismissal was the signal for a general demonstration and parade in Alost where signs were displayed bearing such inscriptions as "Flemings: do not ask for your rights, take them." Speakers demanded that Belgium be divided up into Walloon (French) and Flemish provinces.

DEBT SETTLEMENT WITH UNITED STATES. On August 18 an agreement was reached between Belgium and the United States concerning the settlement of the war debts. The total debt including arrears of interest amounted to \$727,830,500. The settlement divided this sum into two parts, namely pre-armistice and post-

armistice debt. The latter amounting to \$556,050,500 was to be paid in annual installments spread over 62 years with an interest rate of  $3\frac{1}{2}$  per cent. Because of the economic conditions of Belgium lenient terms were arranged for the first 10 years. Beginning with the eleventh year the payments would approximate \$10,000,000 annually. The pre-armistice debt was also to be paid in 62 years but the interest on that amount was remitted. The debt settlement was followed by an attempt to get a credit for \$150,000,000 in the New York market for the purpose of stabilizing the franc. On November 23 the cabinet announced that in order to get this sum the budget for 1926 would have to be reduced by 150,000,000 francs. When this was published in the press bitter denunciation of British and American financiers ensued. A former minister of finance stated that it was evident that "Belgium was in the grip of British and American financiers, who were dictating their conditions, and that the Belgian parliament was no longer in control of the situation. When the government admitted that these statements were virtually true the press of all shades of political opinion denounced the "state of vassalage and servitude" which had been imposed upon the country by foreign capital.

**BELLOWS, GEORGE WESLEY.** American artist, died January 8. He was born at Columbia, O., Aug. 12, 1882, and after graduating from Ohio State University in 1901, he studied painting in New York under Chase, Kenneth Miller, and Robert Henri. At the age of 27 he was elected an associate of the National Academy of Design, and in 1913 became an academician. His earlier work was in landscape. Later he practiced portraiture and the painting of figure subjects. Many of the latter secured prizes or honorable mention in competitions and soon were to be found in the collections of the leading art galleries in the United States. He exhibited at the International Exhibition in Venice, Royal Academy in Berlin, Royal Society in Munich, the International Exposition in Rome, Kensington Museum in London, and in the chief cities of the United States. His more important awards include the 1st Hallgarten prize of the National Academy of Design, 1913; bronze medal Carnegie Institute, 1914; gold medal from the Panama-Pacific Exposition, 1915; gold medal Pennsylvania Academy, 1921; 1st Harris prize Art Institute, Chicago, 1921; 1st prize at the National Arts Club, 1921; as well as the Peck medal of the Pennsylvania Academy in the same year; and 1st prize at the Carnegie Institute, 1922. He was a member of the National Institute of Arts and Letters, of the New Society of Artists, and of art clubs in several cities. His work was characterized by breadth and boldness of handling as well as strength and sincerity of treatment.

**BENEFACTIONS.** See UNIVERSITIES, AND COLLEGES; CHEMISTRY, INDUSTRIAL; ART MUSEUMS.

**BENSON, ARTHUR CHRISTOPHER.** English poet, biographer and essayist, Master of Magdalene College, Cambridge University, died June 17. He was born Apr. 24, 1862, at Wellington College, of which his father, later Archbishop of Canterbury, was the 1st Master. His mother was Mary Sidgwick, the sister of William Henry and Arthur Sidgwick. Arthur Benson was a

brother of E. F. Benson the author of *Dodo*, and of Monsignor Hugh Benson, also a novelist of distinction. Arthur Benson studied at Eton and Cambridge, becoming in 1881 a scholar of King's College at that University. In 1884 he was placed in the 4th division of the first-class in the Classical Tripos, and in the following year became Master at Eton where he taught with success for 18 years. In 1903 he resigned to engage in literary work, being selected to edit a selection of Queen Victoria's letters which he brought out in 1907 in coöperation with Lord Esher. For this work he received the C.V.O. In 1904 he moved to Cambridge and became a fellow of Magdalene College, later becoming president and on the death of Dr. S. A. Donaldson in 1915 being nominated Master. He was a prolific author and soon became widely known for his essays, which began with the anonymous *Memoirs of Arthur Hamilton* (1886); and included *The Upton Letters* (1905); and *From A College Window* (1906), by which he was probably best known. In the field of biography, his earliest effort was a study of Archbishop Laud (1887), criticized as not founded on an adequate knowledge of the period; later he wrote an excellent life of Archbishop Benson (1899), a study of his father which was affectionate, reverential, and critical. In the *English Men of Letters Series* he wrote *Rossetti* (1904); *Fitzgerald* (1905); *Pater* (1906); the first named being the best and marked by scholarship and discriminating appreciation. His collected *Poems* were published in 1909. His novels of which *Watersprings* (1913) is considered to approximate the character of the essays, in many cases are brooding, meditative, and introspective rather than characterized by action. His *Chris Gascoyne*, published in 1924, and *The House of Menerdue*, published in April, 1925, were characterized by charm, sympathy, grace, and humor.

**BEREA COLLEGE.** A non-sectarian, coeducational institution at Berea, Ky., founded in 1888, and designed to serve the educational needs of the mountain people of the Southern Appalachians. The enrollment for the fall of 1925 was 1904, divided as follows: college 399, normal 136, academy 420, Foundation and Junior High School 808, training school 138, special students 3. In the summer school of 1925, 340 students were enrolled. There were 83 members of the faculty, distributed as follows: college 23, normal 12, academy 18, foundation and junior High School 25, training school 5. Four members of the faculty were added in the college during the year and one of the teaching staff of the academy. The library contained about 47,500 volumes. The endowment in 1925 amounted to \$1,975,374.08 while the income for the year ending June 15, 1925, was \$102,768.60. During the year a new women's gymnasium was nearing completion. President, William J. Hutchins, D.D., LL.D.

**BERMUDA.** A group of small islands constituting a colony of the British West Indies, lying about 580 miles from Cape Hatteras, N. C. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles) it is a favorite winter resort for American tourists, who number annually some 28,000. Area, 19.3 square miles; population, according to the census of 1921, 20,127 (7006 white). The estimated civil popu-

lation in 1923 was 20,846. Statistics for commerce and finance follow:

	1921	1922	1923
	£	£	£
Imports .....	1,840,240	1,266,696	1,882,401
Exports .....	224,626	233,296	493,800
Revenue .....	201,882	214,082	309,916
Expenditure .....	237,492	220,476	277,925

In 1923 the total tonnage of vessels entered and cleared was 2,849,377 tons of which 2,418,704 were British. The public debt in 1923 was £45,000. The chief products are: Potatoes, onions, lily bulbs, and various vegetables. The chief imports in 1923 were: Provisions; beef; bran; clothing; cotton goods; electrical goods; flour; hardware; fuel oil; and woolen goods. The chief exports were: Potatoes; onions; other vegetables; and whiskey. The administration is under a governor assisted by an executive council of six members and a legislative council of nine members appointed by the crown and an elected assembly of 36 members. Governor at the beginning of 1925, Lieut.-Gen. Sir Joseph John Asser.

**BERNSTEIN, MAX.** German jurist and writer, died March 9. He was born May 5, 1854, at Fürth and was educated in the Gymnasium of Frankfort-on-the-Main and at Nuremberg, studying subsequently at the Universities of Wurtzburg, Heidelberg, Leipsic and Munich. He was widely known as a lawyer and dramatist and was the husband of Elsa Bernstein, who as Ernst Rosmer, had a wide reputation as a novelist and playwright.

**BES'ARA'BIA.** A former governmnet of the Russian Empire, joined to Rumania in March, 1918. Area, 17,146 square miles. Population estimated in 1919 at 2,344,800. It is represented in the Rumanian legislature by 51 deputies and 24 senators. See **RUMANIA**.

**BIBLE SOCIETY, AMERICAN.** A society founded in 1916 which strives for a wider circulation of the Bible to all people without denominational or racial discrimination. The Bibles are furnished at cost prices and distributed through the Society's home, foreign, and other agencies. The home agencies in 1924 distributed 2,286,175 volumes; the foreign agencies 4,061,526. The Society supplied the Scriptures in 174 languages in 1924, including editions in Roman and Gothic characters and embossed systems for the blind. The total issues of the Society in the 109 years of its service have been 164,907,176 volumes, 94,377,605 of which were in the United States, and 70,529,571 in foreign lands. The number of issues in the United States in 1924 was 2,907,693, of which 1929 were for the blind, and 3,744,606 in other lands, making a total of 6,652,299. Workers in the nine home agencies totaled 788, of which 322 were volunteers; workers in the 12 foreign agencies numbered 2095, of which 232 were volunteers. The work of revising and translating the Bible into additional languages was going on constantly and progress was reported to have been made in 1924. During the year electrotpe plates were completed for the Revised Version of the Zulu Bible, 12mo. Plates were also finished for the series of one cent portions, consisting of the four Gospels, the Book of Acts, and the Book of Proverbs, in English; The Gospel of John, in French, German, Italian, Polish, Portuguese; and the four Gos-

pels and Proverbs in Spanish. A new set of steel-faced printing plates was made for the Minion 18mo English Bible. For the Spanish Testament, Velera Version, revised, small 32mo, a set of printing plates were also made.

The total receipts of the Society for the year from invested funds, donors, sale of books, etc. amounted to \$1,026,163.90; its expenses were \$1,032,906.40. The Society had affiliations with 116 auxiliary Bible Societies throughout the United States, which assist in the circulation of the Scriptures and contribute to it. The contributions from this source in 1924 amounted to \$25,914.35. The officers in 1924 were: E. Francis Hyde, President; Rev. William I. Haven, LL.D., and Rev. Arthur C. Ryan, General Secretaries; Rev. Lewis B. Chamberlain, Recording Secretary; and Gilbert Darlington, Treasurer. The official organ of the Society is the *Bible Society Record*. Headquarters are at the Bible House, Astor Place, New York City.

**BICKNELL, GEORGE AUGUSTUS.** Rear Admiral, United States Navy, died January 28. He was born at Batsto, N. J., and during the Civil War saw service in the United States Navy as acting midshipman. He entered the United States Naval Academy graduating in 1866, serving on the Pacific Station two years later, being present in 1868 when the Japanese ports of Kobe and Osaka were opened to trade. He was in command of the landing party which protected Yokohama until order was restored. He was promoted successively through the various grades until 1907 when he was made rear admiral. During the Spanish-American War he commanded the *Niagara* and in 1899 the *Monocacy* at Shanghai, China. From 1902-4 he was commandant of the Naval Station at Key West, Fla., and from 1904-6, in command of the battleship *Texas*, after which he served as commandant of the Pensacola and Portsmouth navy yards retiring from active service in 1908.

**BICYCLE RACING.** See **CYCLING**.

**BILLIARDS.** The 1925 billiard season was one of continued upsets with the result that only one title holder retained his laurels. This one exception was Robert L. Cannefax, professional three-cushion champion, who however was barred from competing during the greater part of the season. The biggest surprise of the year was contributed by Edouard Horemans of Belgium who defeated Jacob Schaefer at 18.2 balkline billiards by a score of 1500 to 1495. Schaefer had previously captured the title from Willie Hoppe. The triumph of Horemans marked the first time in 20 years that the world's 18.2 title had passed into other than American hands. Francis A. Appleby succeeded his brother, Edgar T. Appleby as national amateur 18.2 balkline champion through his defeat of John A. Clinton, jr., in an exciting play-off for the title. In pocket billiards Frank Taberski regained the championship from Ralph Greenleaf who had reigned supreme in this branch of the cue game since 1920. The national amateur pocket billiard title was captured by Carl Vaughan who overthrew J. Howard Shoemaker, holder of the championship for a decade.

**BLOOD PRESSURE.** See HIGH BLOOD PRESSURE.

**BOHEMIA.** A constituent member of the state of Czecho-Slovakia (q.v.) since the downfall of the Central Powers in 1918; formerly a crownland of Austria; situated in the north-western part of the former Austrian-Hungarian Empire with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czecho-Slovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582. Bohemia is represented in the Czecho-Slovak legislature by five senators and nine deputies.

**BOHEMIUM.** See CHEMISTRY, under *New Elements*.

**BOILERS.** During 1925 improvements continued in the design of boilers and boiler auxiliaries with a tendency to high temperatures as well as to high pressures. Preheating the air so as to secure a higher temperature level in the furnace, due to the recovery of waste heat from the flue gases, was showing interesting results. The adoption of such equipment did not involve any serious difficulties and it was believed that air temperatures of from 500 to 600 degrees Fahrenheit could be employed and even that temperatures up to 800 degrees might be practical. During the year, according to the annual summary in this field in *Power* (New York), there was increased use of water-cooled furnace walls, a number of units so equipped being in successful operation. In a type of a boiler designed by B. W. Burroughs, of Montreal, Canada, the furnace was formed entirely by the boiler tubes, so that full advantage was taken of flame radiation. In another new boiler, known as the Wood boiler, the furnace portion was square with complete water walls and was fired with a burner at each of the four corners. There was also additional use of pulverized fuel and the Buffalo General Electric Company had under construction for pulverized coal firing a boiler with about three-quarters of a square foot of boiler heating surface per kilowatt of capacity, the boiler containing but nine rows of tubes.

During the year discussion continued as to the advantage of using high pressures and the limits to which such pressure could be extended. In some plants where pressures ranged from 550 to 600 pounds and temperatures up to 750 degrees, good results had been secured with but slight increase in the initial cost. But above the ordinary limit of about 400 pounds for the standard boilers, the installation had to be carefully arranged. A second 40,000 kilowatt unit in the Philo Station of the Ohio River Power Company was put into service in 1925, working in conjunction with a similar unit installed late in 1924. Both of these had been operated with and without reheat, and it was found that for wide variations in load a constancy of station economy could be maintained at from 550 to 600 pounds. One of the 6000 kilowatt cross-compound units of The Commonwealth Edison Company at its Crawford Avenue Station, Chicago, installed in 1924, was operated from May, 1925, with reheat, with marked suc-

cess, as was also a boiler at the new Columbia Station at Cincinnati. One of the interesting plants of the year was at the Edgar Station of the Edison Electric Illuminating Company, at Weymouth, Mass., where the main portion operated at 375 pounds pressure and in addition there was a boiler and turbine operating at 1200 pounds pressure, using steam exhausted from the turbine at 375 pounds and then reheated at the high pressure element. Another instance of high temperature was in a design prepared for a plant in Czecho-Slovakia where temperatures of from 840 to 930 degrees Fahrenheit at 1400 to 1700 pounds pressure at the throttle were to be employed in connection with a 18,000 kilowatt turbine with four cylinders on a single shaft. The year also witnessed the record for boilers of large size, two units under construction for a central heating plant in Detroit having some 40,000 square feet of surface. Previously the high pressure heating boiler in the Cecil plant of the Alleghany County Steam Heating Company with 32,750 square feet of surface held the record in this respect.

One of the new developments of the year was the Brunler International Combustion boiler, brought out in Belgium. Here air and oil, which were supplied at boiler pressure join under water and the products of combustion pass to the engine along the steam.

During the year the Emmett Mercury boiler at Hartford (See YEAR BOOK for 1923) was given a thorough and protracted test, which was so favorable that further developments in this field were undertaken. A different type of boiler, based on this principle, was designed and installed, which was built in sections that could be removed for cleaning and inspection. There was also involved a new type of mercury heater and a three stage turbine in place of the original single stage unit. For the new type an efficiency of some 70 per cent is anticipated. Indeed, in units of this type, it was stated that capacities of 9000 kilowatts in a mercury turbine and 12,000 kilowatts in the steam unit were being undertaken and the performance of such machines will be regarded with interest.

During the year there were developed superheaters which could be employed with high pressures and high temperatures and also new types of economizers. Automatic control systems applied to stoker firing and pulverized-coal burning were installed during the year and in the notable Hudson Avenue Station of the Brooklyn Edison Company, it was reported that the daily routine boiler efficiency was being maintained within 2 per cent of the best test efficiency records. Four automatic combustion control was being supplied to other large boilers. A mixture controller operated groups, and these in turn were susceptible of control by the supermaster. The year witnessed also improvements in various auxiliaries which were thought to contribute considerable plant efficiency. Taken all in all, the mechanical engines responsible for boiler developments made an excellent record during the year, providing satisfactory equipment for the large new steam plants where fuel economies were secured.

**BOKHARA,** bo-kä'rá. A state in Central Asia, formerly a dependency of the Russian Empire, later known as the Bokharan People's Soviet Republic, and since September, 1924, a part of the Soviet Socialist Republic of Uzbek.

It is bounded on the north by the Russian provinces of Samarkand and Syr-Daria; on the south by Afghanistan; on the southwest by Transcaucasia and Khiva; and on the east by Ferghana. The area is estimated to be in the neighborhood of 79,000 square miles and the population is placed at about 3,000,000. The chief towns with the estimated populations are Bokhara, 75,000; and Karshi, 25,000. The religion is Mohammedan. Bokhara produces corn, fruit, silk, tobacco, cotton, hemp, and farm animals; and the chief minerals are gold, salt, alum, and sulphur. The trade is mainly with India to which raw silk is exported and from which tea, indigo, Dacca muslin, etc., are imported. By the revolution of Aug. 30, 1919, the Amir was dethroned and the Soviet government was set up, which formed a military and political agreement with Russia. In September, 1924, Bokhara and Khiva were joined together to form the Soviet Socialist Republic of Uzbek.

**BOLIVIA.** A republic of South America situated in the interior and bounded by Brazil on the east and Chile on the west. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

**AREA AND POPULATION.** The area is estimated at 514,155 to 532,437 square miles, but this is exclusive of the claims and disputes with Paraguay, which, if settled in favor of Bolivia, would bring the total area to about 562,047 square miles; population, estimated in 1924 at 2,990,220 as compared with the 1915 estimate of 2,889,970 and the census figure of 1900 of 1,744,568. In 1924 the population of La Paz was estimated at 118,250. Other large towns with their estimates at the same time were: Cochabamba, 34,281; Potosi, 30,122; Sucre, 16,194; Tarija, 10,843; Oruro, 32,908; Santa Cruz, 18,315; Trinidad, 6269.

**EDUCATION.** Education in Bolivia is both free and obligatory. According to the latest statistics there were 504 national primary schools, about 650 municipal schools, and about 108 private schools, making a total of 1265 schools for lower education. Sixteen higher grade schools were established besides the National School of Commerce at La Paz, and the University at Sucre, which bestowed degrees in law, medicine and theology. The best secondary institutions are those endowed by American Methodists at La Paz and Cochabamba. In 1918 (the latest available figures) there were 54,192 pupils. The University of St. Francis Xavier (formerly known as the University of Sucre) is one of the oldest in America, having celebrated its tercentenary in 1924.

**PRODUCTION, MINERAL RESOURCES, ETC.** Agriculture is in a very backward condition, although it is estimated that 4,940,000 acres are under cultivation. In some regions irrigation by means of artesian wells is being attempted. The principal products are potatoes, coffee, cacao, barley, rice, and rubber. Bolivia ranks next to Brazil as the leading rubber-exporting country of South America. Mining is the only important industry. According to the United States Bureau of Foreign and Domestic Commerce the figures for Bolivian mineral exportation in 1923 and 1924 indicate a prosperous condition of mining activities in that country. Nine minerals are listed among the exports of the two years, and all show larger totals in 1924

than in the preceding year—some conspicuously larger—with the exception of copper and silver. The total mineral exportation of 1923 was valued at 101,096,618 bolivianos, while the 1924 shipments had a value of 109,240,646 bolivianos, more than 60,000,000 of this amount representing exports during the first six months.

There was a perceptible increase during 1924 in tin mining, which is by far the most important mineral industry of the country, but the expansion in trade is more conspicuous for some of the other products. The total exportation of lead in 1924 was almost four times that of 1923, although shipments in the second half of the year were somewhat less than those of the first half. Copper exports showed a considerable decrease, and those of silver fell off to less than half the 1923 total in quantity. The value of silver exports, as expressed in bolivianos, however, was not greatly changed, owing partly to increased prices for silver and partly to the lower exchange value for the boliviano. The 1923 silver exportation was valued at 9,368,505 bolivianos and the 1924 at 8,673,047. The exportation of bismuth and antimony increased considerably throughout the year. Zinc mining fell off sharply throughout the first half of the year, but during the next half was larger than during the entire year 1923. The accompanying table shows the exports of the two periods in 1924, in comparison with those in 1923.

#### BOLIVIAN MINERAL EXPORTS IN 1923 AND 1924

Products	1923 Kilos	1924	
		First six months Kilos	Last six months Kilos
Tin .....	50,425,261	27,082,987	26,399,535
Lead .....	8,982,704	19,631,378	18,950,791
Silver .....	22,458,912	7,250,914	8,678,471
Copper .....	82,291,178	11,613,059	9,502,210
Antimony .....	709,553	616,388	793,345
Bismuth .....	210,448	244,660	154,526
Zinc .....	390,000	53,000	416,195
Wolfram .....	.....	16,686	.....
Gold .....	14	26	4
Total .....	115,468,070	66,459,076	54,895,077

**COMMERCE.** Bolivia has no seaports of her own, and depends on the river ports of the Paraguay and Madeira rivers. Inasmuch as the principal exports are minerals the latest information available will be found in the foregoing paragraph. The only other export of note is rubber which in 1923 was valued at 3,447,345 bolivianos. The total value of all imports in 1923 was 55,589,505 bolivianos. The chief imports are: Provisions, hardware, wines and spirits, cotton, woolen, linen, and silk goods, and ready-made clothing.

The figures for the imports and exports for each of the years 1920 to 1924, inclusive follow:

#### VALUE OF BOLIVIAN IMPORTS AND EXPORTS, 1920 TO 1924

Year	Imports		Exports	
	Bolivianos		Bolivianos	
1920.....	65,339,505		156,018,744	
1921.....	70,853,152		66,919,445	
1922.....	49,967,267		94,769,561	
1923.....	55,589,505		107,693,861	
1924.....	62,570,410		115,191,409	

**FINANCE.** The appropriations for the year 1925 were: national budget, 44,976,204 bolivianos; department budget, 10,551,286 bolivianos;

total, 55,427,490 bolivianos. The appropriations for the department do not include those for the municipalities that have the right to vote certain taxes (with the consent of Congress) to care for their local needs (sanitation, public lighting, water mains, paving, etc.) The 1924-25 Congress voted 42,220,400 bolivianos, which covered all expenses for the year and balanced the budget. According to the United States Bureau of Foreign and Domestic Commerce the funded external debt is now payable wholly in dollars. The balance of the sterling loan of 1908 was redeemed on July 1, 1924, and the £600,000 loan secured early in 1925 was not considered part of the funded debt. The principal amounts outstanding of the three dollar loans at the end of 1924 were:

Refunding loan of 1922 (8 per cent) ...	\$27,446,500
Dollar gold external 6's of 1917 .....	1,936,500
Sanitation bonds of 1920 (6 per cent) ...	1,607,000
<b>Total .....</b>	<b>\$30,990,000</b>

The first is the only general foreign obligation of the nation, as the second and third are served primarily by local revenues of the departments of La Paz and Cochabamba. The original principal amount of the refunding loan of 1922 was increased in 1924 by \$5,000,000 issued exclusively to provide for the completion of the railroad from Atocha to Villazon under contract with an American firm. Operations of the sinking fund have reduced the total issue of \$29,000,000 to \$27,446,500. The internal funded debt totaled 19,501,833 bolivianos at the end of 1924, as compared with 12,372,962 at the end of 1923. Most of the increase was due to the issuance of internal bonds to take up the sterling loan of 1908.

**COMMUNICATIONS.** According to the United States Bureau of Foreign and Domestic Commerce, Bolivia has shown great enterprise in its transportation schemes, in spite of economic factors. In 1925 the country possessed 1076 miles of road in operation and proposed to build fully twice as much more. The linking of four South American countries by railways of the same gauge was achieved when the road connecting Atocha with Villazon, Bolivia, was opened on July 23, 1925. At Villazon the road connects with the Argentine railway system, and at Atocha it joins the system operated by the Antofagasta (Chile) and Bolivia Railway Co. (Ltd.), offering connection with Antofagasta or, via the Arica-La Paz Railway to Arica or the Guayaquil-La Paz Railway and its connections, with the principal cities of Peru. Thus this line, which is 124 miles long rendered possible another all-rail transcontinental route where previously the Chilean Transandine alone was able to give such service. The lines in operation in 1925 were as follows:

Arica-La Paz Railway, 125 miles in Chile and 151 miles in Bolivia; Antofagasta & Bolivia Railway (Ltd.), 575 miles in Bolivia and 275 miles in Chile; Atocha-Villazon Railway, 127 miles; Empresa Luz y Fuerza Electrica de Cochabamba, 49 miles; Qnaqui-La Paz Railway, 60 miles; Huanchaca de Bolivia Railway, 26½ miles; La Paz-Yungas Railway, 16½ miles additional line under construction; Machacamarca-Unica Railway, 37 miles; Potosí-Sucre Railway, 84 miles; additional line under construction; Bolivia Railway Co. (Ltd.) 416 miles.

**GOVERNMENT.** Executive power is vested in the president, elected by popular vote for four years, who is ineligible for reelection; and in a cabinet of six departments. Legislative power is vested in a congress of two chambers. President at the beginning of 1925, Dr. Bautista Saavedra (elected for the term 1921-25).

**HISTORY.** On January 23 Señor José Cabino Villaneuva and Señor Abdon Saavedra, a brother of the president of Bolivia were nominated for the presidency and vice-presidency of the republic, respectively. They were virtually assured of election because of the lack of opposition. Dr. Bautista Saavedra, the president at the beginning of 1925, retired from office during the year. The Bolivian constitution provides that a president may not be reelected for two successive terms. The election was held on May 2 and the two candidates mentioned above were successful. They represented the Republican party and polled 45,000 votes as against 11,000 for the Liberal candidate Dr. Salamanca. The inauguration took place on August 6. Some disorder preceded the election, particularly in Oururo and Cochabamba. On August 6, President Coolidge sent the following cablegram to the President of Bolivia: "On this national holiday, when Bolivia celebrates the centenary anniversary of its independence as well as Your Excellency's elevation to the Chief Magistrate of your Republic I take pleasure in extending sincere wishes of my government in which I join heartily for the increasing prosperity of Bolivia in the coming years of national life. I also offer to Your Excellency personally the assurance of my high regard and best wishes for the success of your administration."

On September 1, the Bolivian congress took the rather unusual step of annulling the election of President Villaneuva. According to the terms of the constitution, when such action is taken, the presidency devolves upon the president of the senate, until such time as a new election can be held. The charges brought against the president were fraud and ineligibility. The supporters of the president said he was busted because he refused to be subservient to Dr. Saavedra, the former president. Saavedra turned over the office of chief executive to Felix Gutzman, the president of the senate, and announced the following cabinet: Foreign Affairs, Señor Medina; Interior, Señor Mogro; Finance, Señor Suarez; Agriculture, Señor Fernandez; Instruction, Señor Anze; War, Señor Gutierrez. President Villaneuva fled the country to Chile.

**BOLL WEEVIL.** See COTTON; also ENTOMOLOGY, ECONOMIC.

**BOLSHEVISM.** See RUSSIA.

**BONI, GIACOMO.** Italian archæologist, died at Rome July 7. He was born in Venice, April 25, 1859, and after a common school education became a draughtsman in the office of the director of the restoration of the Palazzo Ducale where he studied for his degree at the Higher School of Architecture and taught himself the classics and English. He early began critical and architectural writing and in 1882 met Ruskin of whose work he was a great admirer. After preparing reports for the Ministry of Public Instruction on the monuments of Apulia he was called in consultation by Pope Leo XIII to advise on the state of the Sistine Chapel. In 1898 Boni took charge of the excavation of the Forum and extended the work, particularly by

the exploration of the Temple of Vesta. In 1912 presiding over the topographical section of the International Archaeological Congress in Rome he made a full report of his work in the Forum. In addition to excavations made at the base of Trajan's Column which secured interesting results, he took up operations at the Palatine particularly on the site of Domitian's Palace. One of his most important finds on the Palatine was the figure of a Winged Victory. Found during the third year of the War, and considered an omen, it was placed in a prominent position. In 1916 while engaged in War work he suffered a stroke of paralysis, but recovered and resumed his work as official head of the Forum and Palatine excavations. He was instrumental in the reconstruction of the Campanile at Venice. One feature of his work was to heal the scars of excavation by appropriate plantings and gardens. Boni was one of the greatest of Italian archaeologists.

**BOOTH, JOHN RUDOLPHUS.** Canadian lumberman and manufacturer, died at Ottawa, December 8. He was born in Waterloo, Shefford County, Quebec, of North of Ireland stock, Apr. 4, 1827, and receiving but the simplest education worked on his father's farm at an early age. When 21 years old, he married and gave up farming. Crossing the border to the United States he worked as a carpenter and learned the art of bridge building. In 1852 he returned to Canada and after working in a local machine shop started a shop of his own and later leased a small shingle mill. After some experience with sawmills in Ottawa he secured the contract for supplying the lumber for the Parliament buildings. After the Civil War in the United States his business expanded, and he introduced many improvements into the handling of timber. About 1868 he secured timber limits on the Ottawa River and increased the capacity of his mill. Gradually he secured more and more timber lands and eventually became the owner of more pine timber than any other holder in Canada. To develop his timber property and secure access to it he built the Central Canada Railway running from Montreal to Parry Sound on Lake Huron, and after operating it with success for some 25 years, sold it in 1904 to the Grand Trunk Railway as a part of which it later passed into the Canadian National system. The purchase price was said to be \$14,000,000, and the transaction involved by a bitter lawsuit. Booth was interested in the development of electrical power, having at times selected sites for mills where water power was available and could be utilized. In 1893 his plant, producing a million feet of lumber a day, was destroyed by fire. In 1900 and 1903 he lost millions of feet of lumber in the conflagrations which spread through the Canadian woods. In 1875 Booth acquired a large lumber mill and assorting yard at Burlington, Vt., and later a box factory in Vermont. At the time of his death the Booth mills employed about 2000 men, and ran day and night for seven months in the year. In the winter time some 800 employees were wont to go into the woods. He was a director of the Grand Trunk Pacific Railway, president of the Dominion Nickel and Copper Company, and a director of the Canada Cement Company. Even at the age of 98 it was his custom to visit the main groups of his timber properties. He was said to be the wealthiest man in Canada, owning some

4000 square miles of timber land. His fortune was estimated as between \$50,000,000 and \$100,000,000.

**BOOTS AND SHOES.** Improvement in the manufacturing and selling situation in boots and shoes toward the end of 1925 followed the reported termination of over-production in grades of leather used in the industry. The depression in leather incident to the general fall of prices in 1921 had been followed by a prolonged period in which prices failed to satisfy the leather producers and promoted a policy of hand-to-mouth buying among shoe retailers. It was reported at the end of 1925 that sales of leather for the first time in several seasons were running in excess of output. The course of American boot and shoe production for the first nine months of the year exceeded moderately the figures for the corresponding portion of 1924, as did likewise prices and exportation. From January through October were produced, in 1925, 274,256,000 pairs; in 1924, 263,305,000 pairs. Exports in the same period in 1925 totaled 5,490,000 pairs; in 1924, 5,249,000 pairs. Wholesale prices in October, 1925, in several standard grades quoted by the Department of Commerce, ruled from  $2\frac{1}{2}$  to  $5\frac{1}{2}$  per cent above those of October, 1924. Exportations compared favorably with those of the British industry, which reported for October, 1925, £493,027 of boot and shoe exports, as against £571,135 of exports for October, 1924. The boot and shoe producers employed in October, 1925, an average of 97,024 workers at total weekly wages of \$2,153,559. The part of the industry employing rubber as material had to cope with the abnormally high prices for rubber in 1925. The U. S. Army authorities were reported as having conducted tests at three army posts to determine the relative merits of leather and composition soles for military wear, and the result was published, unofficially, as having been in favor of retaining leather soles. A labor dispute in the shoe manufacturing centre at Haverhill, Mass. was settled by the adoption of an industrial agreement between the local producers and workers, to run three years. In boot and shoe design great attention was given in 1925 to the creation of striking and uncommon styles, in concession to the prevailing taste in costume, but was combated by some trade authorities as departing too far from sound policy.

**BOB'NEO.** An island in the Malay Archipelago, next to Australia, Greenland, and New Guinea the largest in the world. See **BRITISH NORTH BORNEO, BRUNEI, SARAWAK, and DUTCH EAST INDIES.**

**BORWICK, LEONARD.** An eminent English pianist, died in London, September 16. He was born at Walthamstow, Essex, Feb. 26, 1868. Having received his first instruction on the piano from Henry Bird in London, he entered the Frankfort Conservatory in 1884, studying piano with Clara Schumann, harmony with B. Scholz and composition with I. Knorr. After winning a striking success at his debut with the London Philharmonic Society (May 18, 1890), he made successful tours of England and the Continent. His appearances in the United States (1914-15) were among the sensations of the musical season. In England he was one of the most popular pianists, and for many years he was associated with Joachim in the latter's concerts of chamber-music in London.

**BOSNIA AND HERZEGOVINA**, Hér'tsã-gó-vená. Provinces of the newly established state of Jugo-Slavia (q.v.). They were formerly provinces of the Turkish Empire. In 1908 control over them was acquired by the Austro-Hungarian Empire. In 1918, after the collapse of this empire they were turned over to Jugo-Slavia. Area, 19,768 square miles; population at the census of 1920, 1,889,929.

**BOSSI, MARCO ENRICO**. A famous Italian organist and composer, died on board the steamship *de Grasse*, while returning from his first concert tour of the United States. He was born at Salò, Brescia, Apr. 25, 1861. After receiving his first instruction from his father, Pietro Bossi, himself an excellent organist, the boy entered the Bologna Conservatory at the age of ten. He continued study in Milan until 1881. Immediately after his graduation he was appointed organist at the Como Cathedral, remaining there ten years. He was professor of harmony and organ, 1891-95, at the Naples Conservatory, and director of the Liceo Benedetto in Venice, 1896-1902. After serving as director of the Liceo Musicale at Bologna, 1902-12, and passing four years in retirement at Como, he was called to direct the Accademia S. Cecilia in Rome, where he continued until his death. Almost from the beginning of his career he was reputed the greatest organist in Italy. He made many tours of Europe. Among his numerous compositions the most important are his organ-works, notably a Concerto for organ and orchestra in A minor and two great sonatas. Two operas were produced at Milan, *Paquita* (1881) and *Il Veggente* (1890).

**BOSTON SYMPHONY ORCHESTRA**. See MUSIC, *Orchestras*.

**BOSTON UNIVERSITY**. A non-sectarian institution of higher education, Boston, Mass.; founded in 1869. The enrollment for the fall term, 1925, was 8634, of which 4347 were men and 4287 were women, distributed as follows: college of liberal arts, 831; college and extension courses, 739; college of business administration, 3238; college of practical arts and letters, 928; school of theology, 253; school of law, 610; school of medicine, 208; school of education, 1029; school of religious education and social service, 389; graduate school, 409. The enrollment for summer session of 1925 was 1053, and the fall enrollment in extra-mural courses, 1408. The faculty numbered 490. The libraries contained 94,146 volumes and 16,709 pamphlets. Productive funds of the institution amounted to \$3,473,966.99, and the income from productive endowment was \$121,109.19 (Figures for year ending June 30, 1925.) Among changes of interest during the year was the establishment of a "week-end college" by the School of Education. Its purpose is to provide courses in such an arrangement that teachers in service and others who cannot attend the full-time programme may carry a half-time programme entirely on Friday afternoons and Saturdays. The new arrangement was made in response to large numbers of requests, and has proved highly successful. Another change was the establishment of a department of journalism as a full-time, four-year, degree programme eventuating in the Bachelor of Journalism degree. Journalism had been taught at the university for 10 years but the new department was the first four-year degree journalism programme in New England. The

entering class included students from as far away as San Diego, Calif. Also during the year the graduate department of the College of Business Administration was established, making possible the winning of a Master of Business Administration degree by graduates of all recognized institutions. Heretofore only graduates of the Boston University College of Business Administration had been eligible for the M.B.A. degree. Bishop William F. Anderson of the Boston area of the Methodist Episcopal church continued as acting president of the university.

**BOTANY**. At the meeting of the American Association for the Advancement of Science held in Washington, D. C., Dec. 29, 1924, to Jan. 3, 1925, the botanical sections and affiliated societies were especially well attended, and very full programmes were presented, and the same was true for the meeting of the Association and affiliated societies which opened in Kansas City, Mo., Dec. 28, 1925. Botany also figured at the meetings of the British Association for the Advancement of Science at Southampton, England, Aug. 26 to Sept. 2, 1925; the French Association at Grenoble, July 27 to Aug. 1, 1925; the South African Association at Oudtshoorn, July 6 to 9; and The Indian Scientific Congress at Bombay, Jan. 4 to 9, 1926. A Cotton Research Experiment Station was established by the Empire Cotton Growing Corporation in connection with the College of Tropical Agriculture at Trinidad, and special attention was to be given to investigations on the breeding, physiology, and diseases of the cotton plant.

**NEW JOURNALS**. Several new journals of interest to botanists were begun during the year. Among them are: *Resumptio Genetica*, a review journal of genetics, and *Bibliographia Genetica*, a series of monographs on genetics, both under the editorship of J. P. Lohs and H. N. Kooiman; *Archiv für Wissenschaftliche Botanik*, edited by W. Ruhland and H. Winkler; and *Die Kranke Pflanze*, the official organ of the Plant Protection Association of Saxony.

**NECROLOGY**. Among botanists of international reputation who died during 1925 were: E. Bethel of Colorado, well known for his work on rusts, September 8; T. G. Brandegee, known for his work on the flora of the Pacific Coast of the United States, April 7; Oskar Brefeld, founder of modern mycology and formerly professor in the University of Berlin, September 18; H. T. Brown, English plant physiologist and well known for his work on photosynthesis, February 6; M. A. Carleton, plant pathologist and probably best known for his introductions of new types of cereals into the United States, April 26; Francis Darwin, Cambridge University, England, an investigator in plant physiology, September 19; Oskar von Kirchner, botanist and for 10 years editor of *Zeitschrift für Pflanzenkrankheiten*, April 25; L. Maquenne, French physiologist, January 17; and J. Massart, professor of botany, University of Brussels, Belgium, August 16.

The literature of botany during 1925 was very voluminous, all fields of activity being well represented, but only a small part limited to a few fields can be briefly reported.

**PHYSIOLOGICAL STUDIES**. Furness has given an account of recent work of Willstätter and his associates on chlorophyll. Two forms are recognized which vary in their proportions in different plants (*Chem. Age*, 13 [1925], p. 30).

He also reports the synthesis of flavones, flavonols, and anthocyanins. Wlodek found by combining the spectra of Willstätter's *a* and *b* chlorophylls, the absorption bands closely coincide with those of the living leaf (*Nature*, 115 [1925], p. 439). He suggests that in the plant the two chlorophylls are present in separate solvents, and changes in the absorption spectrum are due to different proportions of the two pigments or that new spectra are produced through temporary combinations with carbon dioxide. Stoklasa and Penkava claim photosynthesis in the chlorophyll cell is greatly stimulated by beta and gamma rays emitted from various radioactive substances (*Internatl. Rev. Sci. and Pract. Agr.*, 3 [1925], p. 327).

Waller found evidence that associates photoelectric currents of green leaves with the activity of chlorophyll. Etiolated or variegated portions of leaves gave a different electric response than green ones, but the differences gradually disappeared under the effect of sunlight. The chloroplasts are considered to play a dominant part in the electrical activity of plants (*Ann. Bot.*, 39 [1925], p. 515). Baly considers it as definitely proved that the first product of photosynthesis by the living plant is formaldehyde and that no catalyst is necessary for the formation of formaldehyde from water and carbon dioxide when exposed to ultra-violet light (*Jour. Indust. and Engin. Chem.*, 16 [1925], p. 1019). Samples of a sirup produced in this way are said to have properties of formaldehyde produced by other methods. Dhar and Sanyal claim that formaldehyde can be synthesized from water and carbon dioxide under long exposure to tropical sunlight, but in their experiments no sugars were formed (*Jour. Phys. Chem.*, 29 [1925], p. 926). On the other hand Galivialis reports experiments in which no formaldehyde or carbon synthesis occurred in distilled water saturated with carbon dioxide and exposed to sunlight, but traces of formaldehyde were observed when tap water was used. It was found that when enzymes extracted from plants were added to water saturated with carbon dioxide and exposed to sunlight sugars were formed (*Biochem. Ztschr.*, 158 [1925], p. 67). Spoehr had previously claimed that there was an internal factor which acts independently of temperature, light, water, and carbon dioxide in the photosynthetic process. This he called the photochemical acceptor, and he believed enzymic or respiratory processes entered into the phenomena of photosynthesis (*Carnegie Inst. Wash. Yearbook*, 1922). Priestly considers hexoses the first sugars of photosynthesis and that cane sugar is not directly connected with the formation of starch (*New Phytol.*, 23 [1924], p. 255). However, Parkin claims this hypothesis does not explain the presence of cane sugar in leaves. He believes the bulk of the hexose sugars found in leaves comes from the inversion of sucrose (*New Phytol.*, 24 [1925], p. 57).

Attention continued to be given to the subject of the transfer of solutes through plants. MacDougal (*Carnegie Inst. Wash. Pub.* 365) and Bode (*Jahrb. Wiss. Bot.*, 62 [1923], p. 92) have both given support to Dixon's cohesion theory as explaining one of the principal factors in the upward movement of liquids in plants, evaporation and transpiration sustaining the cohesion column. MacDougal claims the action of colloidal masses in dead cells at terminals is

able to maintain enough transpiration to support the cohesion column in dead stems (*Science*, 61 [1925], p. 370). Recent experiments of Curtis (*Ann. Bot.*, 39 [1925], p. 573) and of Snow (*Nature*, 116 [1925], p. 360) tend to show the path of movement of solutes in plants is through the phloem.

Garner and Allard continued their studies of the photoperiod of plants (YEAR BOOK, 1920, p. 93) and have shown a close correlation between the prevailing lengths of day and the length of the vegetative period of plants, and their conclusions have been confirmed by a number of other investigators. Deets found dwarf nasturtiums bloomed earlier when the period of daily illumination was shortened. Tomatoes proved to be long-day plants, and peppers were intermediate. From freezing point determinations of the cell sap of plants produced under different periods of illumination, he thinks it probable that the difference in relative length of day and night influences the nitrogen-carbohydrate ratios in plants (*Amer. Jour. Bot.*, 12 [1925], p. 385). Tinker, by subjecting plants to definite periods of illumination, found everblooming plants were not affected, short-day plants were hastened in flowering, and long-day plants retarded by subjecting them to short periods of daily illumination. He considers this evidence of the effect of environment on the chemical composition, form, and behavior of plants (*Ann. Bot.*, 39 [1925], p. 721). Lubimenko and Szegloff report similar conclusions and believe the adaptation of plants to different latitudes corresponds to their adaptation to daily illumination periods (*Compt. Rend. Acad. Sci. [Paris]*, 176 [1923], p. 1915). Adams claims the intensity of light, as well as its duration, should be considered in investigations of this character. He reports exposure of four to six hours during the middle of the day had the same effect on plant development as six to nine hours in the morning or evening. He also considers temperature an important factor in this respect (*Amer. Jour. Bot.*, 12 [1925], p. 98). Munerati found continuous illumination of hemp plants prolonged the period of vegetable growth to over eight months, while shortening the period of daily illumination retarded vegetative and accelerated reproductive development. Spinach showed no tendency to flower 60 days after planting when grown under normal illumination but flowered in 25 days under continual lighting. (*Compt. Rend. Acad. Sci. [Paris]*, 179 [1924], p. 1200). Clark claims the rate of reproduction of Lemna was increased by prolonging the length of day by using electric light up to full illumination (*Jour. Phys. Chem.*, 29 [1925], p. 935).

GENETICS AND PLANT BREEDING. The literature in genetics and plant breeding was voluminous during the year. Segregations and correlated inheritances for many crosses were reported, and in many cases indications are given that may prove to be of great economic importance if applied to future work. Bateson has given a possible explanation of bud sports. He considers them due to the emergence of distinct previously existing components, originally formed by somatic segregations at some earlier stage. He claims at times that the hidden component forms the central core of a periclinal system, emerging in adventitious buds (*Nature*, 116 [1925], p. 189). Some rather striking results have been reported on the genetics of wild

and related plants. Afzelius found in the Senecioneae variations of chromosome numbers of from 5 to 90, indicating a remarkable evolution (*Acta Horti Berg.*, 8 [1925], p. 123). Blackburn claims that the species of *Rosa* fall into definite groups in respect to their chromosome number and behavior, and Brainard has described 82 natural hybrids involving 30 species of *Viola* (*Vermont Sta. Bul.* 239). Trelease has enumerated many hybrid oaks in his recent monograph of *Quercus*. East and Mangelsdorf found that sterility in *Nicotiana* is inherited in a definite manner (*Natl. Acad. Sci. Proc.*, 11 [1925], p. 166). De Vries has described additional races of *Oenothera lamarckiana*, which he considers recombinations of mutated qualities, which are probably as old as the parent species (*Bot. Gaz.*, 80 [1925], p. 262). Shull reported a third linkage group in *Oenothera* that may aid in interpreting some of the puzzling genetical phenomena in this genus (*Natl. Acad. Sci. Proc.*, 11 [1925], 715). Blakeslee and Belling have contributed additional data on chromosome mutants, chromosome distribution, and inheritance in *Datura* (*Natl. Acad. Sci. Proc.*, 10 [1924], p. 116).

Genetical studies of economic plants were reported by many investigators, only a few of which can be noted. Gaines found continued selection of smut-free heads of wheat and oats in heavily infested fields failed to produce strains that were more disease resistant than the parent variety. By crossing he has secured promising results, and he believes resistance to smut is due to the combined effect of several unit characters which give dominance to resistance (*Phytopathology*, 15 [1925], p. 343). Kempton, Eyster, Frajkovich, and others have described variations in maize and have suggested explanations as to their genetic behavior. Sax reports having crossed *Aegilops cylindrica* with common wheat, but the  $F_1$  generation was completely sterile. From this behavior he believes the common or *vulgare* wheats owe their origin to a cross between *Aegilops* and a wheat of the emer group (*Genetics*, 9 [1924], p. 454). Jenkins, from a study made in Wales, claims that natural crossing in wheat is frequent in that country (*Welsh Jour. Agr.*, 1 [1925], p. 104). Ikeno reports an intermediate type in the  $F_2$  generation of barley that he believes rose as a mutant. The new type behaved as a dominant when crossed with other varieties (*Ztschr. Induktive Abstam. u. Vererb.*, 37 [1925], p. 210). Emerson made use of the principle of length of day (see above) to produce flowering of teosinte to use in crossing with maize. Flowering was hastened by about two months by this treatment (*Jour. Heredity*, 15 [1924], p. 41). Vavilov, studying hybrids of spring and winter wheats, arrived at the conclusion that spring wheats are not mutants of winter varieties but they arose as selections from primitive populations containing both forms (*Ann. Inst. Agron. Saratov*, 1 [1923], p. 17). Kiesselbach and Peterson found so great a constancy in the number of chromosomes in different types of maize as to indicate the variability of this species results from factor mutations rather than from irregularity in chromosome behavior (*Genetics*, 10 [1925], p. 80).

A number of papers appeared on sex determination, but Sharp concludes that the theory of sex determination, due in all cases to the same

set of differential factors, is inadequate (*La Cellule*, 35 [1925], p. 193). Schaffner, having worked with a number of species of dioecious plants, claims that the determination and differentiation of sex in plants is correlated with physiological relationships rather than with factors and chromosome relations (*Amer. Nat.*, 59 [1925], p. 115).

The failure to produce hybrid strains of Asiatic and American cottons has been frequently reported. Zaitzev reports having successfully crossed them, but the hybrid was completely sterile. This incompatibility is probably due to chromosome differences, American cotton having 13 chromosomes and Asiatic cotton 26. Krantz claims that more than 30 years have elapsed without any notable improvement in the standard varieties of potatoes and that mutations are too infrequent to be of value to breeders (*Potato Assoc. Amer. Proc.*, 11 [1924], p. 40). On the other hand, Meyers believes it is possible to improve the yield and quality of potatoes through the isolation of high yielding strains. He also claims that bud variation is not infrequent in potatoes (*Idem* p. 5). Thompson has given an interesting account of sweet potato breeding in the Virgin Islands where some varieties set seed quite freely. The large number of seedlings raised fall into rather definite groups. About 2 per cent of the seedlings have had three or more distinct foliaceous cotyledons, the significance of which is not evident (*Virgin Islands Sta. Bul.* 5).

PLANT DISEASES. The annual toll due to plant diseases was becoming an important factor in crop production. The Plant Disease Survey of the U. S. Department of Agriculture, in cooperation with collaborators in every State, estimated the 1924 losses in a number of important crops as follows: Wheat, 84,963,000 bu.; oats, 112,425,000; corn, 253,911,000; potatoes, 107,681,000; apples, 41,239,000; peaches, 5,370,000 bu.; and cotton, 1,905,000 bales.

The wheat rust situation in the United States in 1925 was generally favorable, there having been practically no rust on winter wheat and only 5 to 10 per cent losses in the spring wheat areas of North Dakota, Minnesota, and South Dakota. The seventh year of the campaign for the eradication of barberries, which serve as an alternate host of the rust, has been completed. This work is carried on by the U. S. Department of Agriculture cooperating with 13 of the leading wheat-producing States of the Middle West. It was estimated that over 11,000,000 bushes had been destroyed, and local epidemics of stem rust had been greatly reduced, and such as do occur could be traced to their sources. An epidemic of stem rust of oats in Wisconsin that spread over an area 60 miles long was traced to escaped barberries that were infected. A Cereal Disease Conference was held July 8 to 14, at which many of the problems of disease control were discussed. The conference met at Ames, Iowa, and later visited the agricultural experiment stations at St. Paul, Minn., and Fargo, N. Dak.

Efforts to control the white pine blister rust (*Peridermium strobi*) through the eradication of *Ribes*, the alternate host of the fungus, were being continued, and in the eastern white pine area about 3,500,000 acres were reported as cleared of currant and gooseberry plants and the pines were no longer menaced. In the Pa-

cific Northwestern States the situation was not so promising. The disease, first reported in 1921 in British Columbia, slowly was spreading to the East and South. A survey of the region had shown that the fungus has spread to the northern limits of the five-needle pines, but climatic conditions were unfavorable for its rapid spread in other directions. Late in 1925 it was reported to have been found in Oregon, just south of the Columbia River. The most common means of spreading this disease to healthy pines is the cultivated black currant, and this plant has been quite generally eradicated throughout the Northwest. Control measures through the eradication of *Ribes* will be difficult in this territory on account of the topography of the region and the large number of wild species of *Ribes*.

The chestnut blight, *Endothia parasitica*, had reached the southern limits of the commercial growth of chestnut trees. It was known to occur in South Carolina, Georgia, and Alabama. In North Carolina the disease was spreading quite rapidly.

Citrus canker had practically disappeared in the Gulf States as a result of the very active measures taken for its eradication. According to the Report of the Chief of the Bureau of Plant Industry, U. S. Department of Agriculture, for 1925, no new infections were found during the past year in Mississippi, Alabama, and Texas. A few infected localities still existed in Louisiana, and in March, 1925, five infected trees were found in town lots at Boynton, Fla. The State had been considered free from this disease since October, 1923. Citrus canker was believed to have been eradicated in South Africa, no new infections having been recorded for three years.

The potato black wart disease situation in the United States continued about as formerly, being confined to a few regions in Pennsylvania, West Virginia, and Maryland. In Great Britain three new regions were found to be infected in 1925.

A large amount of attention continued to be given to a group of diseases usually designated as infectious chlorosis, mosaic, degeneration diseases, etc. Diseases of this type, affecting such widely different crops as sugar cane and potatoes, were being studied by plant pathologists in many lands. Sugar cane mosaic was known to occur in nearly every important sugar-producing country, though the loss varies with countries and varieties of cane grown. Certain grasses, as well as maize, are subject to the disease, and the green aphid (*Aphis maydis*) is known to be the principal carrier of the infection from one plant to another. Planting of resistant varieties, roguing out diseased plants, and suppression of carriers are the only efficient means of control now known. On the potato nearly a dozen types of mosaic are recognized, some of which are identical in Europe and America, whereas others differ. Extensive experiments in the Great Plains and other regions show that climatic conditions cause a masking of symptoms of mosaic diseases, and apparently disease-free plants may produce diseased ones when transferred to lower elevations. Like the cane mosaic the principal carrier for secondary infections in the potato is a plant louse (*Macrosiphum solanifolii*).

The same methods of control suggested for

cane mosaic have been adopted with success in growing seed potatoes. The causal agents of mosaic diseases have not yet been definitely determined. Olitsky claims, from experiments with mosaic of tobacco and tomatoes, that the causal agent is a living microbial body which can be cultivated in culture media (*Jour. Expt. Med.*, 4 [1925], p. 129). Kunkel considers it improbable that ultramicroscopical bodies are the cause of mosaic, and he calls attention to the plastic intra-cellular bodies associated with a number of mosaic diseases (*Amer. Jour. Bot.*, 12 [1925], p. 517). Schultz claims that apparently disease-free potato plants may act as sources of infection (*Science*, 62 [1925], p. 571), and Johnson has found that either the potato tuber is a carrier of infection or the protoplasm of the tuber is a causal agent of one or more of the virus diseases of solanaceous plants (*Wisconsin Sta. Research Bul.* 63).

A conference for the study of potato virus diseases was held at Lincoln, Nebr., December 28, 1925.

The presence of a number of plant diseases that are new or of possible great economic importance was reported during 1925. Downy mildew of corn and certain grasses was found for the first time in America on *Setaria viridis* in Iowa; take-all of wheat (*Ophiobolus graminis*) was reported as occurring in North Carolina; flag smut of wheat (*Urocystis tritici*) was still present in a few localities in Illinois; a severe outbreak of fire blight on the collar and roots of apple trees was reported in the Potomac Valley; and the nematode, *Tylenchus dipsaci*, was found for the first time in New Zealand. A new apple tree disease called perennial canker has been described by Zeller and Childs from Washington and Oregon. Carsner reported a disease of beans caused by the virus of sugar beets in Idaho. New bacterial diseases were described as follows: Cook, wilts of cosmos and eggplants; Elliott, leaf spot of *Martynia*; McCulloch, a leaf and corm disease of gladiolus; Brown, a disease of tomato fruits; and Jones, a disease of alfalfa. Durrell and Sackett described a root rot of alfalfa that is probably the same disease as that described by Jones.

**BOTREL, THEODORE JEAN MARIE.** French poet, died July 27. He was born at Dinan, Cotes-du-Nord, Sept. 14, 1868. His first important volume of poems, *Chansons de chez nous*, published in 1896, was crowned by the French Academy. This was followed by *Contes du lit clos* (1898); *Chansons de la fleur de lys* (1899); *Coups de dairon* (1900); *Chansons en sabots* (1901); *Chansons en dentelles* (1902); *Chansons de not'pays* (1902); *Chansons de Jean qui chante* (1907); and the plays: *Heur d'ajoncs* (1904); *Doric et Lena* (1905). His *Notre-Dame Guesclin* (1906) received the Capurain prize of the French Academy. His more recent works included, *La Paimpolaise* (1908); *Les Chansons des clochers à jour*; *Les Aïouettes* (1910); *Les Chansons de la veillée* (1912); *Les Chants du breuvac* (1913); *Les Chansons de route* (1917); *Chants de bataille et de victoire* (1918). Botrel was Laureat of the French Academy and received numerous decorations during the World War including the Médaille Militaire and the Croix de Guerre. He was also made an Officier de l'Instruction publique; Chevalier of the orders of St. Gregory the Great and of Leopold, etc. He was a member of many literary and artistic societies.

**BOURGEOIS**, bōō'zhwā', LÉON VICTOR AUGUSTE. French statesman and first president of the Council of the League of Nations, died September 29. He was born in Paris, May 29, 1851, and studied at the Lycée Charlemagne and the Faculté de Droit at Paris, being made a Docteur en Droit. He entered official life in 1877 becoming general secretary of the Department of the Marne, and in 1880 subprefect of Reims. In 1882 he became prefect of Tarn, and in 1885 prefect of Haute-Garonne, having served between these appointments as secretary general of the Préfecture of the Seine in 1883. In 1886 he became connected with the Ministry of the Interior and in 1887 was made prefect of police. In the following year he was elected a deputy from the Marne and also became Under Secretary of State in the Ministry of the Interior where he served until 1889. In 1890 he became Minister of Public Instruction serving in this capacity until 1892 when he became a Minister of Justice, and actively engaged in prosecuting those engaged in the Panama scandals. In 1895 he became Prime Minister with the portfolio of Minister of the Interior, and in the following year became Minister of Foreign Affairs, but the ministry which he formed on a radical basis did not receive the support of the Senate so that he resigned in the following year. He was Minister of Public Instruction in the Brisson Cabinet. In 1889 he was the head of the French delegation to the Hague Peace Conference, and from June, 1902, to January, 1904, presided over the Chamber of Deputies. In the meantime he had been chosen as a member of the Permanent Court of Arbitration at the Hague. In 1906 he became Minister of Foreign Affairs in the Sarrien cabinet, and headed the French delegation to the Peace Conference of 1907. In 1912 he was appointed Minister of Labor. During the World War he served in the cabinet assembled by Aristide Briand being a minister without portfolio, and in 1918 he was elected to the Presidency of the Senate, a post that he held until 1923 when he retired to devote himself actively to furthering the cause of the League of Nations. It was this work to which he devoted the latter part of his life. Having been the French member of the commission which drafted the League Covenant in 1919, on October 14 of that year he was named the first French Representative of the League Council. He became the first chairman of this council, presiding at its initial meeting on Jan. 16, 1920. He was active in the sessions of the League in Geneva and was particularly interested in an attempt to control the illicit traffic in habit-forming drugs, being one of the signers of the International Opium Convention held at Geneva in 1925. His more important works include the following: *Solidarité* (1894); *Education de la Démocratie* (1897); *Philosophie de la Solidarité* (1902); *La Déclaration des Droits* (1903); *Pour la Société des Nations* (1910); *La Politique de la Prévoyance Sociale* (1914); *Le Pacte de 1919 et la Société des Nations* (1920); and *Le Traité de Versailles* (1920).

**BOVINE TUBERCULOSIS.** See VETERINARY MEDICINE.

**BOWDOIN COLLEGE.** An institution of the higher education at Brunswick, Me.; founded in 1794. In the fall of 1925 the total registration of 533 students included 108 in the senior class, 109 in the junior class, 119 sophmores, 193

freshmen, and 4 special students. Two additional members of the faculty since June, 1925, increased the total to 40. The amount of the productive funds was \$3,856,957.06, and the income for the year amounted to \$228,741.25. The library contained 135,000 bound volumes. President, Kenneth Charles Morton Sills, LL.D.

**BOWLING.** The twenty-fifth annual tournament of the American Bowling Congress was held at Buffalo, N. Y., the winners in the various events and their scores being: individual, A. Green, Chicago, 706; two-man, Schupp-Karich, Chicago, 1318; five-man, Weisser Blue Ribbons of Buffalo, 3023; all events, L. C. Long, Buffalo, 1977.

**BOXING.** The failure of Jack Dempsey, heavyweight champion, to defend his title for the second successive year aroused much unfavorable comment among followers of professional boxing, but nevertheless the sport retained a firm grip on the public during 1925. Eight new champions were crowned, although two in turn lost their titles during the year. The most prominent figure was Paul Berlenbach, world's light heavyweight champion, who captured this title on May 30 through his defeat of Mike McTigue of Ireland. Berlenbach later successfully defended his honors in three matches.

Early in 1925 Benny Leonard relinquished the lightweight title he had held so long and Jimmy Goodrich of Buffalo, N. Y., won the New York State Athletic Commission's elimination tournament held for the purpose of producing a successor to Leonard. Goodrich, however, lost his title to Rocky Kansas on December 7.

The death of Pancho Villa removed the title holder in the flyweight division, this championship passing by general consent to Frankie Genaro. But Genaro was decisively outpointed by Fidel La Barba in California on August 23, the latter assuming the flyweight crown. Louis "Kid" Kaplan of Meriden, Conn., won the elimination tournament to decide a successor to Johnny Dundee who had surrendered the featherweight title because of inability to make the weight. Kaplan successfully defended his crown against Babe Herman although one of the decisions in his favor caused much adverse criticism.

The principal bouts of the year included those in which Harry Wills, the negro contender for Dempsey's laurels, knocked out Charley Weinert in one round; Gene Tunney's knock-out of Tom Gibbons in eleven rounds; Jack Delaney's two knock-outs of Tiger Flowers and Dave Shade's three-round knock-out victory over Jimmy Slatery.

Boxing flourished in amateur circles during 1925, the greatly increased interest taken in this sport by the leading colleges of the country being especially noticeable. The winners of the final bouts in the national Amateur Athletic Union championships were:

112 pounds, Alfred Romhson, Shelton, Conn.; 118 pounds, August Gotto, Los Angeles, Cal.; 126 pounds, Ray Alfano, St. Louis, Mo.; 135 pounds, James McGonigal, Los Angeles, Cal.; 147 pounds, Bernarde Barde, Dartmouth College; 160 pounds, Clayton Frye, Los Angeles, Cal.; 175 pounds, Henry Lamar, Washington, D. C.; heavyweight, Joseph Woods, Los Angeles, Cal.

**BOY SCOUTS OF AMERICA.** An organization incorporated in 1910 and chartered by

Congress June, 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. The National Constitution of the Boy Scouts of America declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft and to teach them patriotism, courage, self-reliance and kindred virtues." Each boy joining the organization takes the Scout Oath. The Scout Law obliges the members to exert such qualities as trustworthiness, helpfulness, loyalty, kindness, cheerfulness, bravery, cleanliness and reverence. Camping and hiking are among the foremost scout activities as well as nature study and many kinds of outdoor work, exercise and craftsmanship. Successive ranks in membership are attained by passing tests graded in difficulty. Merit badges, 71 in number, may be attained by meeting requirements for each. These cover proficiency in pursuits both of the useful and of the hobby type, such as dairying, plumbing, pioneering, physical development, astronomy, music, chemistry, among many others equally diverse. By attaining certain numbers of the merit badges, a boy may rise to the higher ranks of Star, Life, and Eagle scout.

In 1925, 312,000 boys spent a week or more each in camp under Boy Scout auspices during the summer. Local councils conducted 556 camps. The Boy Scout movement, in coöperation with the Forestry Department, fights and prevents forest fires, conserves wild life and plants trees. It renders services in local campaigns of various sorts and coöperates with many national societies and movements. Membership in 1925 was 614,737 boys and 169,759 scout leaders. The National Council, the governing body, is at 200 Fifth Avenue, New York. The officers in 1925 were James J. Storrow, Boston, Mass., president; George D. Pratt, treasurer; James E. West, Chief Scout Executive; Daniel Carter Beard, National Scout Commissioner; Mortimer L. Schiff, International Commissioner. Regional scout districts, 12 in number, under direct supervision of the National Council's National Scout Executives, were subdivided, in 1925 into 651 local councils, of which 606 supported paid executives and maintained permanent headquarters. Boys are organized in troops not exceeding 32 each. The troops are made up of patrols of eight or less, each under a boy leader. A scoutmaster commissioned by the National Council is provided for each troop. He must be an adult citizen of proved fitness. Troops are commonly formed in connection with schools, churches, or other existing bodies, and each must be sponsored by a troop committee of three or more adults, who select the scoutmaster and supervise the execution of the programme. The movement is without sectarian, military, or political connection. The Boy Scouts of America publish an official magazine, *Boy's Life*, and magazines for scout leaders as well as merit badge pamphlets.

**BRANTING, HJALMAR.** Swedish statesman and Prime Minister, died at Stockholm, February 24. He was born Nov. 3, 1860, the son of Lars Gabriel Branting, a well-known Professor of Gymnastics and later Director of the Central Gymnastic Institute at Stockholm. He was educated at the Beskow school where he took his bachelor's degree in 1877 and at the age of 17 entered Upsala University and devoted himself

to the study of mathematics and natural science, particularly of astronomy. In 1882 he became assistant in research at the Observatory in Stockholm under Professor Gylden, the Director. His attention, however, was soon directed to politics and journalism and he became the champion of the laboring classes, creating the Social Democratic party in Sweden and acting as its sole leader. In 1896 he was elected a member of the Swedish Second Chamber as the first representative of his party, but by 1921 it had 110 representatives in the Chamber, so that the coalition of two parties was necessary for government. In 1917 a Coalition Ministry of Liberals and Social Democrats was formed in which Branting became Minister of Finance. He was forced to resign a few months later on account of a nervous collapse. In 1920 on account of the fall of the Coalition Cabinet Branting was called upon to form a Labor Ministry which lasted for but a year due largely to lukewarm support from the Liberals. In 1920, the suffrage having been granted to women, Branting decided to dissolve his Ministry and a non-party Government was organized which lasted until after the general elections of 1921. The success of the Social Democrats enabled Branting to form a Government in which he became both Prime Minister and Foreign Minister. This Government in September, 1922, gave way to a Conservative Government made possible by a combination of Conservatives and Liberals. In September, 1924, as a result of elections which gave the Social Democrats a majority over the other two parties separately, Branting formed his third Ministry. It acted on the question of national defense and on the League of Nations' schemes for preserving peace. Branting was in favor of the Geneva Protocol, in the preparation of which he assisted, but the other parties in Sweden were not as favorably disposed to this plan. In the middle of December, 1924, Branting was compelled by illness to relinquish work and on January 25 he resigned as Prime Minister, though remaining a member of the cabinet. He was considered more than a national leader and in December, 1921, the Noble Peace Prize was divided between him and M. Large, Secretary-General of the Inter-Parliamentary Bureau at Geneva.

**BRAZIL.** The largest of the South American states; situated in the northern and eastern part of the continent of South America; a federal republic. Capital and largest city, Rio de Janeiro.

**AREA AND POPULATION.** The area is estimated at 3,276,358 to 3,285,318 square miles. If the lower figure is taken the area is 250,000 square miles greater than that of continental United States. The country is divided into 20 states, one territory, and a federal district. The population of the country according to the census of 1920, is 30,635,605 which represents a density of 9.3 per square mile. The principal cities with their populations, according to the same census are: Rio de Janeiro, 1,157,873; São Paulo, 579,033; Bahia, 283,422; Recife, 238,843; Belem, 236,402; Porto Alegre, 179,263. During the century 1820-1920, while approximately 33,000,000 immigrants entered the United States, only about 3,000,500 entered Brazil. After the war, however, Brazil was taking measures to attract immigration to her shores. European immigration in general has been directed to the middle and southern parts of the country. A decree of

Dec. 31, 1924, which came into effect during 1925, provided for the regulation of immigration to Brazil. This decree restricted the admission of second and third class passengers under conditions prescribed in the law of Jan. 6, 1921, and provided that an immigrant must be able to show documents proving him to be of good character as well as a passport showing his photograph, fingerprints, civil status, age, nationality and profession or trade, which must be viséd by the port or frontier officer. After July 1, 1925, it was provided that the only ports for immigration would be Belem, (Pará), Recife (Pernambuco), São Salvador (Bahia), Victoria, Rio de Janeiro, Santos, Paranagua, São Francisco, and Rio Grande. In 1924 the immigration to the republic was 98,125 as compared with 86,679 in 1923 and 66,968 in 1922. The largest numbers according to nationality were Portuguese, 23,267; Germans, 22,168; and Italians, 13,844.

**EDUCATION.** Education is free but not compulsory, with the exception of seven states where it is both free and compulsory. In 1920 there were 21,748 primary schools with 1,249,449 pupils. Four hundred and forty seven were federal government schools, 9612 state government schools, 4712 municipal schools, and 6977 private schools. There were also about 450 secondary schools with 48,000 pupils, and 367 professional schools with more than 37,000 pupils. The University of Rio de Janeiro is the only official university in Brazil.

**PRODUCTION, ETC.** Owing to the vast extent of its agricultural area, the average holding is of large size. Only a small portion of the total area is cultivated, but recent statistics indicate a rapid increase in the amount, which in 1923 was placed at about 175,104,657 hectares valued at 10,568,008,000 milreis. The chief crop and by far the most important commercially is coffee, which is raised in an area covering about one-eighth of the total and comprising the four states of São Paulo, Espirito Santo, Rio de Janeiro, and Minas Geraes. Approximately four-fifths of the world's supply of coffee comes from this area and one-half of the world's supply from the state of São Paulo alone. The annual crop is usually estimated at 12,000,000 sacks of 132 pounds each. In 1922-23, 5,418,180 acres were cultivated with coffee, yielding 1,140,735 metric tons; in 1923-24, 6,020,254 acres, yielding 876,744 metric tons; the crop for 1924-25 was estimated at 643,142 metric tons.

There is a large variety of other crops of which the most important are cacao, sugar, cotton, rubber, rice, tea, and tobacco. Cotton is grown in nearly all the states, but chiefly in São Paulo, Parahyba, Maranhão, and Ceará. According to the President's message to Congress May 3, 1925, the estimated cotton crop for 1924-25 was 131,118 metric tons, that of the previous year having been 134,875 tons. Unfavorable climatic conditions prevented the realization of as large an increase as was anticipated. The Federal Cotton Service completed arrangements for coöperation with the states of Pará, Bahia, Minas Geraes, Parahyba, Rio de Janeiro, Sergipe, Maranhão, Pernambuco, Rio Grande del Norte, Ceará, and Alagoas, in the first five of which a large increase in the area planted to cotton was noted. The Federal Government, which maintains two cotton experiment stations and a seed farm, distributed for the last crop 175,500 kilo-

grams of seed. The government was also endeavoring to establish a cotton exchange at Rio de Janeiro and other cities. The states leading in the 1924-25 crop were as follows: São Paulo, metric tons, 31,256, area planted, 136,670 hectares; Ceará, metric tons, 18,012, area planted, 79,555 hectares; Pernambuco, metric tons, 15,120, area planted, 73,740 hectares; Parahyba, metric tons, 13,045, area planted, 68,747 hectares; Rio Grande del Norte, metric tons, 13,128, area planted, 64,130 hectares; Maranhão, metric tons, 12,460, area planted, 61,974 hectares. The following table supplied by the Pan American Union from the Agricultural Statistics Service gives the value of the chief Brazilian agricultural products in 1922-23 and 1923-24. The total value of all such products in that year was 7,415,769 contos of reis (one conto equals 1000 milreis).

Products	1922-23	1923-24
	Value in contos of reis	
Brandy .....	89,460	76,504
Alcohol .....	15,966	24,954
Alfalfa .....	86,060	100,978
Cotton .....	628,656	686,813
Rice .....	300,668	307,744
Sugar .....	522,948	617,495
Oats .....	2,617	2,878
Potatoes .....	104,204	119,284
Rubber .....	58,704	68,000
Cacao .....	51,963	69,709
Coffee .....	2,851,839	2,622,408
Rye .....	8,139	8,857
Barley .....	2,778	2,985
Babassu nuts .....	28,000	22,750
Coconuts .....	17,312	22,091
Manioc flour .....	184,684	246,119
Beans .....	220,611	256,870
Tobacco .....	177,241	225,641
Herba matte .....	115,608	192,880
Corn .....	1,027,293	1,224,846
Wheat .....	40,089	64,694
Wine .....	80,966	56,571

Coal, gold, diamonds, petroleum, monazite, manganese, platinum, copper ore, and talc are the chief mineral resources. Sufficient coal is being mined to supply about one-half of the domestic needs. The forests are very extensive and an important source of wealth. Manufacturing is of practically little importance, but is increasing rapidly. The principal single industry is cotton milling which employed about 60 per cent of the people engaged in manufacturing. Silk manufacturing is being encouraged, chiefly in the form of a government subsidy to silk cocoon producers.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, Brazil's foreign trade total for 1924 showed an increase over the four preceding years in the value of both imports and exports. Export values in 1924 were \$86,735,000 as compared with \$68,562,498 in 1923, \$61,317,216 in 1922, and \$45,410,955 in 1921. As in past years, the volume of Brazil's exports was less than that of imports, because heavy products, such as coal, heavy machinery, etc., made up the bulk of the imports. Exports were 394,000 tons less than those of 1923, the great increase in the value of coffee more than compensating for this decrease in exports. Coffee prices on the Rio de Janeiro market registered an increase in December, 1924, of 96 per cent over those in January of the same year, while those in New York increased in the corresponding period by 106 per cent. Of the 26 principal exports produced, only five regis-

tered an increase in quantity during the year, while the value of eight increased during 1924.

Exports of animal products diminished by 37,455 tons and 63,376 contos in 1924 compared with the previous year. Mineral exports decreased by 76,638 tons and 9117 contos, due chiefly to smaller shipments of manganese. Vegetable products, which make up about 90 per cent of the exports of Brazil, decreased by 378,478 tons, but the value of these shipments increased by 638,085 contos over the previous year. This was due to the coffee exports, which were as follows: 1923, 14,466,000 sacks valued at 2,124,000 contos (£47,078,000); 1924, 14,226,000 sacks valued at 2,928,000 contos (£71,833,000). In spite of the restrictions on entries of coffee into the exporting ports, the quantity actually shipped was but 240,000 sacks less than in 1923. As a result of higher prices for herva matte, the value of the exports of this product also increased over 1923, although the amount shipped was less than in the preceding year by about 9000 tons. Exports of tobacco, vegetable oils, fruits, cacao, and rubber all increased in value in 1924.

Sugar, the second most important export in 1923, fell to eleventh place in 1924, decreasing by 118,709 tons and by 111,627 contos, or £2,402,000 in value. Hides and skins were of sufficient value to rank second in 1924 exports. Cotton followed, with a decrease in exports from the year before of 12,706 tons, representing a decrease in value of 80,150 contos or £1,638,000. Exports of rice also fell greatly during 1924, decreasing 27,604 tons, with a consequent loss in value of 19,269 contos or £409,000. The accompanying table shows the principal export commodities with their 1924 amounts:

#### PRINCIPAL BRAZILIAN EXPORTS IN 1924

Commodity	Quantity Tons	Value	
		Contos	£ sterling
Coffee .....	853,560	2,928,572	71,833,000
Hides .....	52,048	108,290	2,553,000
Oil seeds .....	96,791	100,676	2,530,000
Cacao .....	68,874	98,174	2,426,000
Chilled meat .....	75,312	88,575	2,250,000
Herva matte .....	78,750	87,952	2,179,000
Rubber .....	21,568	79,212	1,962,000
Tobacco .....	29,586	74,796	1,845,000
Cotton .....	6,464	38,989	1,003,000

Perhaps the most significant fact shown by the 1924 figures of exports is that, excluding shipments of coffee, the value in sterling of all other products during the year is lower than that of all Brazilian exports, excluding coffee in 1913—indicating that too much attention is being given to the development of the one great crop of Brazil at the expense of all others. An undue amount of dependence is being placed on coffee, and any considerable fall in the price of this commodity would result unfortunately for Brazil's economic stability. The accompanying table shows the exports of coffee from Brazil compared with those of other products.

Brazilian imports during 1924 increased to 4,340,981 tons, valued at 2,812,021,000 milreis, from 3,575,564 tons valued at 2,267,159,000 milreis in 1923. The volume of imports increased by 21.4 per cent in 1924 over 1923, while the increase in value was 24 per cent. The increase in volume was largely due to greater imports of iron and steel products, coal and coke, cement, cotton textiles, copper products, woolen

#### COFFEE EXPORTS FROM BRAZIL COMPARED WITH THOSE OF OTHER PRODUCTS

<i>Years</i>	<i>Coffee</i>	<i>Quantity Other products</i>	<i>Total</i>
	<i>Tons</i>	<i>Tons</i>	<i>Tons</i>
1913.....	796,000	586,000	1,382,000
1919.....	778,000	1,130,000	1,908,000
1920.....	692,000	1,409,000	2,101,000
1921.....	742,000	1,177,000	1,919,000
1922.....	760,000	1,862,000	2,122,000
1923.....	868,000	1,861,000	2,229,000
1924.....	854,000	981,000	1,835,000

<i>Years</i>	<i>Coffee</i>	<i>Value Other products</i>	<i>Total</i>
1913.....	240,779,000	224,672,000	265,451,000
1919.....	72,607,000	57,478,000	130,085,000
1920.....	52,822,000	54,699,000	107,521,000
1921.....	34,694,000	23,893,000	58,587,000
1922.....	44,242,000	24,836,000	68,578,000
1923.....	47,078,000	26,106,000	73,184,000
1924.....	71,833,000	23,270,000	95,103,000

textiles, chemical products, machinery, gasoline, kerosene, and other petroleum products, wheat and wheat flour, olive oil, automobiles, railway equipment, and dishes. The leading suppliers of Brazil during 1924 were the United States, England, Argentina, Germany, France, and Italy.

The total value of exports from Brazil to the United States during 1924, as recorded at all the American consulates in Brazil, was \$189,504,817, a net increase of \$40,534,492—nearly 30 per cent—over that of 1923. The increase was almost entirely due to higher coffee prices, shipments from the ports of Santos and Victoria accounting for \$45,212,689 out of a gross increase of \$46,601,317 in declared exports from all Brazil. Coffee shipments from the two above ports totaled 825,209,352 pounds in 1924 as compared with 825,895,620 pounds in 1923, a decrease of 686,268 pounds, while the value rose from 104,742,430 in 1923 to \$149,900,699 in 1924.

A comparative statement of the value of exports to the United States from the various consulates was given:

#### VALUE OF EXPORTS CERTIFIED AT AMERICAN CONSULAR OFFICES IN BRAZIL FOR UNITED STATES

Consulate	1923		1924	
	\$		\$	
Bahia .....	8,533,714		\$7,281,418	
Para .....	4,844,680		3,832,550	
Manaos .....	4,259,990		5,648,618	
Maranhao .....	55,274		42,970	
Rio de Janeiro .....	19,634,711		19,127,568	
Victoria .....	5,225,432		10,947,910

Sao Paulo .....	481,184		92,663	
Total .....	148,970,325		189,504,817	

In the year 1925 Brazil exported to the United States goods valued at \$221,787,803, while its imports were valued at \$87,461,021. In 1925 the exports of coffee to the United States amounted to 212,142,617 pounds valued at \$184,792,895.

**FINANCE.** Due to the failure of Congress to pass the 1925 budget law by Dec. 31, 1924, the provisions of the 1924 budget remained in force until action was taken. In the meantime the president issued a decree Jan. 7, 1925, suspending operations on all public works in charge

of the Federal government and providing that agreements should be entered into for extending the time of execution of those under contract. The necessary budget law for expenditures in 1925 was signed by the president on Jan. 12, 1925. The accompanying appropriations were fixed for the department:

Department	Contos of reis gold	Contos of reis paper
Interior .....	3,520	99,978
Foreign Affairs .....	5,266	2,642
Navy .....	1,000	95,076
War .....	200	177,939
Agriculture .....	235	44,902
Communications .....	9,807	375,832
Treasury .....	64,385	248,830

The accompanying table published in the Pan American Union shows the status of the public debt of Dec. 31, 1924:

Amount issued		Pound-sterling loans		Amortization		Balance in circulation
Par value	Amount received	Par value	Amount paid	Amount paid		
120,411,334	112,800,984	17,788,040	14,969,051			102,623,294
		Franc loans				
339,450,500	306,181,784	3,244,000	2,931,584			336,206,500
		Dollar loans				
75,000,000	68,250,000	7,949,500	7,712,231			67,050,500

The funded internal debt, which amounted to 1,778,201 contos on Dec. 31, 1923, had increased to 2,031,495 contos on Dec. 31, 1924, the increase being due to issues of government bonds for 216,409 contos and treasury notes for 36,855 contos. Brazil's 1926 Federal budget estimates showed expenditures of 64,098 contos gold and 248,830 contos paper, against 61,380 contos gold and 248,830 contos provided for in the 1925 budget. The increase in estimated gold expenditures is due to larger amortization and interest payments on the foreign debt in accordance with loan contracts. This amount includes 42,485 contos for interest payments on the funded debt, 5435 contos for interest on loans contracted for the taking over of leased railways, and 15,522 contos for interest and amortization of the Central Railway electrification loan.

COMMUNICATIONS. In 1922, 25,264 steam and sailing vessels of 27,459,975 tons entered the ports of Brazil, and 25,300 steam and sailing vessels of approximately the same tonnage cleared. The merchant vessels of Brazil in the same year numbered 541 of 323,927 tons. In 1924 the railroad mileage of Brazil totaled 30,309 kilometers (18,821 miles) of lines in operation, or an increase of 384 kilometers over 1923. Of the total mileage, 7310 kilometers were owned and operated by various state governments; 17,705 kilometers by the Federal government, which operated 8562 kilometers and rented 9143 kilometers to state governments, or to private companies. The remainder, consisting of 5294 kilometers, was privately owned through concessions from the Federal government. Meter-gauge line aggregated 27,313 kilometers, and 1.60 meter-gauge, 1808 kilometers; the remaining 1188 kilometers were divided among 0.60, 0.66, 0.76, and 1.44 meter-gauges.

The railways in 1924 did not have a particularly satisfactory year. Fourteen of the 26 principal railways and railway systems showed a loss from 100 contos to 17,000 contos, as in the case of the Brazil Central. The largest profit was 32,600 contos by the São Paulo Railway. In

1924 and in 1925 the extension of the railways was limited by a general policy of retrenchment, but a few lines of vital importance were built or extended. In 1925, 74 kilometers of the "Longitudinal Line" destined to afford rail communication between Rio de Janeiro and Bahia was built. Of this track, 46 kilometers were on the Central of Brazil and 28 on the Central da Bahia. At the end of the year there were in operation between Rio de Janeiro and Bahia 1522 kilometers of line, while 788 kilometers were required to complete the work, on part of which construction was in progress. Another important construction item was the connection of the Rede Bahiana, which was in process of extension through the state of Sergipe, with the line connecting Alagoas, Pernambuco, Parahyba and Rio Grande do Norte. This route was complete except for a section of about 200 kilometers between Collegio and Cajueiro. When

this line is completed along with other lines under construction, the capitals of 15 states will be connected by rail with each other and the capital of the republic. Studies were being made during the year for the electrification of the Central Railway of Brazil, but like other improvements and extensions, financial conditions would not permit of any activity in this direction.

GOVERNMENT. Executive power is vested in the president, who with the vice-president is elected directly by the people for four years and is ineligible for reelection; and legislative power in the National Congress which consists of the Chamber of Deputies and the Senate, the former having 212 members elected for three years by direct vote on the basis of minority representation, and the latter 63 members elected by direct vote for nine years, one-third being renewed every three years. The president in 1925 was Dr. Arturo da Silva Bernardes, elected Mar. 1, 1922.

HISTORY. The revolutionary movements noted in the preceding YEAR BOOK continued during the first few months of the year. A plot was unearthed in January by the police of Rio de Janeiro. The movement was supposed to be sponsored by army officers with the idea of freeing those who were imprisoned for similar plots and then getting possession of the army barracks. The ring leaders were apprehended and a large quantity of bombs and munitions seized. Martial law was to remain in force until April 30. The government suspended all public works throughout the country and made provisions for the extension of contracts in order to protect the parties concerned. This was largely due to the failure of Congress to pass the budget law. President Bernardes in a speech before the Brazilian Congress on May 3 had the following to say concerning the prevalence of revolutions: "I shall frankly report actual conditions. I consider the most urgent necessity today is a revision of the national laws, which allow too much individual freedom. This individual free-

dom has forced eight or nine Brazilian Presidents to decree a state of siege in efforts to maintain public order. At present it is impossible to obtain legislation providing for the proper punishment of the traitors who are taking part in the São Paulo and other seditious movements, as the Constitution does not permit capital punishment except during a time of international war." The revolutionists continued active in São Paulo throughout the summer and when the government pressure became too strong they retired into the interior where they were virtually out of reach of the authorities. The coolness of this state to President Bernardes became increasingly evident, and the press reported that the election of 1926 would be a clearly drawn struggle between the president and the Federal authority, and the protagonists of this state.

In March, through the good offices of Secretary of State Hughes, a long standing boundary dispute affecting Brazil, Colombia, and Peru was settled. As far as Brazil was concerned the chief provision was the signing of a convention between these two countries, by which the boundary between them would be agreed to on the Apaporis-Tabatinga line, Brazil agreeing to establish in perpetuity in favor of Colombia freedom of navigation on the Amazon and other rivers common to both countries.

**BREMA, MARIE.** A noted English dramatic mezzo-soprano, died in Manchester, March 22. Her real name was Minnie Fehrmann, and she was born at Liverpool, Feb. 28, 1856. Although interested in music from an early age, she did not begin to think of a public career until 1890, when she went to George Henschel to study. She made her debut in concert in London, Feb. 21, 1891, under the stage-name of Bremer. On October 19 of the same year she made her operatic debut as Lola in Mascagni's *Cavalleria Rusticana*, also in London. Her success was instantaneous, and so rapidly did she win wide recognition that in 1894 she was engaged to sing Ortrud and Kundry at Bayreuth. The next year she sang the great Wagner rôles with the Damrosch Opera Company in New York, and the following season she appeared at the Metropolitan Opera House. In 1898 she was first heard in Paris, where she became a prime favorite and sang the leading parts in the first performances in France of Wagner's later works. After her retirement from the stage, in 1913, she was appointed professor of singing at the Royal College of Music at Manchester.

**BRETHREN, CHURCH OF THE.** A church established in the United States in 1719 at Germantown, Pa., at one time known as the Conservative Dunkers and originating in Schwarzenau, Germany, in 1708. It is the largest of the five branches of the denomination formerly known as the German Baptist "Dunkers." Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh Day Baptists; and Old Order German Baptist Brethren. The polity of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 50 district conferences and holds a General Conference annually. Figures for 1925 show 1036 churches and a church membership of 120,103. Sunday schools numbered 1226 and scholars 121,160. Foreign missionary work is carried on in India, China, and Sweden, and 1923 marked the

beginning of work in Africa. The total membership of the churches in India and China increased from 2488 in 1919 to 3918 at the beginning of 1926. The budget for 1926 for this work amounts to \$316,500; of this amount approximately \$55,000 is to be devoted to home missionary work. Expenditures in both fields for year ending Feb. 28, 1925, totaled \$275,921.29. Ten colleges are maintained by the denomination, having an enrollment of more than 2000 students. The headquarters of the various church boards are located at Elgin, Ill., including the General Mission Board, General Educational Board, General Sunday School Board, General Welfare Board and Council of Promotion. Officers of the General Conference, in 1925 were as follows: Otho Winger, North Manchester, Ind., Moderator; D. W. Kurtz, McPherson, Kans., Reading Clerk; and I. B. Book, North Manchester, Ind., Writing Clerk. Otho Winger, North Manchester, Ind., is President of the General Mission Board. *The Gospel Messenger* is the official organ of the denomination. *The Missionary Visitor* is the periodical of the General Mission Board.

**BRIDGE, NORMAN.** American physician and author, died January 12. He was born at Windsor, Vermont, Dec. 30, 1844, and after a High School education graduated from the Chicago Medical College with the degree of M.D. in 1868. He settled in Chicago and in 1887 became Professor of Clinical Medicine in Rush Medical College, and in 1898 Professor of Medicine, retiring in 1901 as Emeritus Professor. Dr. Bridge in addition to his work in medicine found time to be identified with many other activities. He was a member of the Chicago Board of Education, 1881-84, serving as president, 1882-83, and was a member of the Board of Election Commissioners, 1886-90. After his retirement from the practice of medicine he engaged in the petroleum business and was vice-president of the Pan-American Petroleum and Transport Company and allied companies. During the World War he was chairman of the National Alien Enemy Relief Commission at Washington. He was the recipient of many honorary degrees including that of A.M. from the Lake Forest University in 1889, LL.D. from Occidental, 1920, and from the University of California in 1922, and Sc.D. from Northwestern University, 1923. His writings include: *The Penalties of Taste and Other Essays* (1898); *The Rewards of Taste and Other Essays* (1902); *Lectures on Tuberculosis* (1903); *House Health* (1907); *Fragments and Addresses* (1915); an autobiographical sketch entitled, *The Marching Years* (1920); *Mental Therapeutics and Other Papers* (1922); and also many papers in various medical journals and other works.

**BRIDGES.** SAN FRANCISCO BAY BRIDGE PROJECTS. The subject of bridges across San Francisco Bay continued to attract attention during the year 1925 and a public hearing on the revision of War Department requirements was held at San Francisco, December 11, 12 and 18. This hearing was called at the request of the San Francisco Board of Supervisors, who had before them several applications for bridge franchises in conflict with the rulings announced by the U. S. War Department for crossings of the Bay. It was the third conference on this subject held by the U. S. War Department in four years and its importance can be indicated by the fact

that 13 projects for bridges and tunnels, or a combination of both, were presented and discussed. There were present not only representatives of the various projects but also those representing the cities of San Francisco, Berkeley, Alameda, as well as other cities elsewhere in the State, and various State organizations who urged the necessity for a continuous roadway across the bay and the approval of some plan of crossing. On the other hand, the city of Oakland was opposed to such crossings on the ground that a bridge might interfere with future water traffic, while the U. S. Navy Department expressed its acquiescence in several of the plans but objected to others that would interfere with the proposed naval base, restrict tidal flow, or interfere in some way with naval operations. Maj. John W. N. Schulz, who represented the War Department, stated that the department would consider whether any proposed structure was "an unreasonable obstruction to navigation." Various speakers referred to the fact that the construction of bridges would reduce the excessive ferry traffic which, in 1924, amounted to more than 125,000,000 automobile vehicles and on the passenger ferries 44,200,000 passengers. It was stated that a bridge head on top of Telegraph Hill, which was somewhat favored by the U. S. Navy Department, was not suitable as it would require approaches of prohibitive length and would involve foundations at a depth exceeding the limits for air pressure. The supporters of the various bridge projects expressed themselves as able to finance the structure they advocated and they claim that the cost would be less than half that of tunnels. A full hearing was held and the data received was transmitted to the War Department for final consideration and decision.

**DELAWARE RIVER BRIDGE.** The year's progress on this notable structure, which has been described in previous YEAR BOOKS, involved the completion of the cable work and the erection of the suspended structure. The reinforced-concrete floor slab was placed and the approaches were built with the exception of the finishing work. It was planned to open the new bridge on July 4th, 1926, on the occasion of the sesquicentennial of the Declaration of Independence and this would have been possible were it not for the differences developing between the States of Pennsylvania and New Jersey, as to the collection of tolls for traffic over the bridge. The State of New Jersey had authorized the construction of the bridge and the issue of bonds on the assumption that interest payment and amortization would be derived from tolls, but the Legislature of Pennsylvania, in an appropriation at its 1925 session, inserted a proviso that the money should be spent only for a structure which would return no tolls on vehicular traffic, either to the State or to the city of Philadelphia. As a result the commissions representing the two States about the middle of the year ceased to cooperate and only current work was promoted. No settlement had been reached at the end of the year and the matter was held over for an extra session of the Pennsylvania Legislature, which was called on December 14, to convene in 1926. It was stated, however, that the general feeling throughout the State was in favor of the collection of tolls in accordance with the New Jersey understanding.

**ARLINGTON MEMORIAL BRIDGE.** During the

year designs were being prepared for the Arlington Memorial Bridge across the Potomac River at Arlington, near the Lee mansion. This monumental bridge was to be one of the most costly ever built in the United States and was designed not only on the score of utility but for its architectural features and adornment. It was estimated it would cost ultimately in excess of \$15,000,000, and not only would improve the traffic connections to the south of Washington, but would add another element to the architectural beauties of the national capital. During the year exploratory and design work was actively carried on in the Office of Public Buildings and Grounds of the District of Columbia, and specifications for bids on the foundation work were prepared.

**WATERLOO BRIDGE, LONDON.** Considerable discussion took place in engineering and other circles during the year in connection with the proposed removal of the Waterloo Bridge across the Thames of London. In 1924 it was noted that the central piers were slowly subsiding and that this had been in process for years, so that it was necessary to close the bridge so that it could be relieved of much of its superincumbent weight and be subject to expert examination. It was found impossible to effect repairs and a temporary steel bridge was erected and opened for use in August, 1925. It was found necessary to remove the older Waterloo bridge, which was one of John Rennie's most famous designs, built in 1817 and was highly esteemed by architects and engineers the world over. With the removal of this bridge, a new and more adequate structure was proposed, which would be wider so that street railways could be run across it, but this, it was held, would further concentrate traffic on a congested portion of London and, while additional communication between the two banks of the river was desired, many believe that another bridge should be built and that the Waterloo Bridge should be retained for limited service. No conclusion was reached as to this matter and an active discussion was taking place at the end of the year.

**NEW YORK.** The New York Legislature during its 1925 session passed three important bridge bills which were signed by Governor Smith. This made available funds for the construction by the Port Authority of bridges between New York and New Jersey across the Arthur Kill and the Hudson River. The sum of \$400,000 was appropriated yearly for five years for each of the two bridges across the Arthur Kill and \$100,000 was made available for preliminary engineering studies of the bridge across the Hudson between Manhattan and the Jersey shore at a point between 175th and 185th Streets, Manhattan. The New Jersey Legislature previously had passed similar legislation.

The plans of the Port of New York Authority to construct two bridges across Arthur Kill, one connecting Perth Amboy, N. J., with Tottenville, S. I., and another connecting Elizabeth, N. J., with Howland Hook, S. I., were approved by the Secretary of War on November 12. The plans of the port authority provided for a fixed cantilever type of bridge between Perth Amboy, N. J., and Tottenville, S. I., with three trusses with a horizontal clearance of 675 feet, 310½ feet, and 245½ feet respectively. The maximum vertical clearance of the two widest spans was to be 135 feet. The design for the Elizabeth-

Howland Hook bridge called for a fixed cantilever type, also with the waterway spanned by one truss having a horizontal clearance of 600 feet and a minimum vertical clearance of 135 feet.

**CENTRAL RAILROAD OF NEW JERSEY, NEWARK BAY BRIDGE.** This four-track structure across Newark Bay, which was almost completed at the end of 1925, was one of the most notable railway bridges under construction during the year. It is 7411 feet in length and carries four tracks, but as it was constructed substantially in the form of duplicate double-track structure, it was the equivalent of nearly 3 miles of two-track bridge. It required 31,000 tons of structural steel, exclusive of 8000 tons used in structures connected with the embankment approaches, and affords two independent channels for the passage of shipping. In other words, there are four two-track vertical lift spans, two of 305-foot span and two of 216½-foot span, centre to centre of piers. The structure consists mainly of long span girders, 36 of which are skew spans 125 feet long, centre to centre of piers. There are 700 feet of viaduct construction at the east end of the bridge and the lift spans and the flanking tower spans already noted. In addition there were five girder spans of odd length. The deck girder viaduct required the fabrication and erection of 288 girders of 124 feet 6 inch length, weighing 54.07 tons each, and 40 girders ranging from 87 to 120 feet. For the substructure of the bridge there were two abutments, 85 double track piers for the girder and tower spans, four four-track spans for the lift spans, and 48 pedestals for the towers of the viaduct approach at the east end. In this substructure there were required 17,000 piles and the mixing and placing of 120,000 cubic yards of concrete. The estimated cost of the entire project was approximately \$15,000,000.

**NARROWS BRIDGE AT VANCOUVER.** The second Narrows Bridge over Burrard Inlet connecting the towns of Vancouver and North Vancouver, B. C., and carrying both railway and highway traffic was completed and opened in November, after being under construction since September, 1923. This crossing has a total length of 1¼ miles, made up of 4500 feet of embankment, 1500 feet of timber trestle and seven steel trusses, including a bascule 185 feet long and one 300-foot through truss. The main channel spans are carried on cylindrical piers, the foundations of which extend to a depth of 106 feet below water level, where the Narrows is 85 feet deep. The deck of the bridge carries a standard gauge railway track in the centre, flanked on either side by two 10-foot roadways with sidewalks on the outside. The cost of the bridge was \$1,800,000.

**DETROIT RIVER BRIDGE.** During the year there was renewed active discussion of the project for a large highway bridge across the Detroit River at Detroit, utilizing franchises and government permits obtained in 1921. The project announced in 1925 involved the location of the bridge near Huron line route in the town of Sandwich on the Canadian side and between Sixth St. and West Grand Boulevard on the Detroit side, or about 1½ miles west of Woodward Ave., which is the central axis of Detroit. Plans were prepared for a suspension bridge of about 1850 feet span and 110 feet clearance height above river level with a single deck, af-

fording 47 feet vehicle roadway. There were to be no facilities for railways or street cars and the entire length between entrances was to be nearly 7000 feet. The estimated cost was above \$12,000,000. The plan involved the guaranteeing of the ventures by the Canadian border cities and the issuing of general bridge bonds in addition to stock issues by the promoters of the company.

**OTHER BRIDGES.** During the year the 1114-foot span suspension bridge at Florianopolis, Brazil, was completed (described in YEAR BOOK for 1923 and 1924). In December the highway bridge over the Mohawk River between Schenectady and Scotia, N. Y., known as The Great Western Gateway, was opened to traffic. At the end of 1925 the Mendota end and the first and second arches of the Fort Snelling-Mendota Bridge were completed and the third, fourth, and fifth arches were under construction. This bridge was mentioned in the 1924 YEAR BOOK.

**HIGHWAY BRIDGE CONSTRUCTION.** A notable feature in the year 1925 was the unusually active highway bridge construction throughout the United States in connection with the improvement of highways and providing increased traffic facilities. The *Engineering News-Record* estimated that in 1925 some \$70,000,000 of bridge contracts were let, which reduced to a 1913 cost basis, was only exceeded in 1914. These statistics, however, included contracts of about \$25,000 so that the year's total was estimated at about \$100,000,000, of which \$50,000,000 represented State and Federal work and \$40,000,000 city and county work. A notable feature of the 1925 construction was the large number of crossings over large streams, while other major bridge projects were under consideration. The success of the Bear Mountain Bridge across the Hudson River led to increased attention being paid to toll bridges and a number of these were under consideration with greater public support. The most important bridges of this kind that were contemplated during the year were the Mount Hope Bridge in Rhode Island and the Arthur Kill and Fort Lee Bridge at New York City. There were under construction the Poughkeepsie Bridge across the Hudson, which is a 1500-foot suspension bridge, and the Philadelphia bridge across the Delaware.

With the increase of vehicular traffic it was found necessary during the year to restrict traffic movements over certain highway bridges. A notable instance was in the case of the Victoria Bridge, Montreal, where all vehicles in excess of 6 feet 6 inch width or carrying loads in excess of that width were restricted to the hours between 11.30 P.M. and 6 A.M. It had been found that with a narrow roadway wide vehicles seriously interfered with the traffic and frequently caused damage.

**BRIGHAM YOUNG UNIVERSITY.** An institution of the higher learning at Provo, Utah; founded in 1875. It comprises colleges of arts and sciences, education, commerce and business administration, applied science, fine arts, and the graduate division. An extension and research division is also maintained. The enrollment for the autumn quarter of 1925 was 1140, and in addition there were about 450 students in the elementary and secondary training schools which are connected with the college of education. In the 1925 summer session 504 registered. The faculty numbered 97 regular

members, and 29 special. The endowment funds amounted to \$175,000, and the annual appropriation of church funds for operating expenses was \$200,000 in addition to student fees. During the year 1925 the first unit of the Heber J. Grant Library building was completed at a cost of \$165,000. A special library appeal and campaign among alumni added several thousand volumes to the library, making the total 45,000 volumes and 40,000 pamphlets. Improvements were made during the year in the landscape gardening of the University grounds. The college of fine arts was established in 1925, and also the departments of zoölogy, entomology, botany, and bacteriology. The Alpine summer school on Mt. Timpanogos was enlarged to accommodate more students in the natural sciences by the addition of several buildings. President, Franklin Stewart Harris, Ph.D.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** An association founded at York, England, in 1831, and comprising 14 sections, representing all branches of pure and applied science, with a membership of representative British scientists. Officers, elected in 1925, were: President, H. R. H., the Prince of Wales; General Secretaries, F. S. Smith, O. B. E., F. R. S., Prof. J. L. Myres, O. B. E., F. R. S.; General Treasurer, Dr. E. H. Griffiths, F. R. S.; Secretary, O. J. R. Howarth, O. B. E. The annual meeting for 1926 was to be held at Oxford. The meeting of 1925, held at Southampton, August 16-September 2, included full programmes of proceedings for each of the Society's component sections. The president for the Southampton meeting, Prof. Horace Lamb, in his address dealt with recent geophysical progress, notably that in the investigation of the age of earth. Important presidential addresses were as follows: Physics and Mathematics, Dr. G. C. Simpson spoke on "The New Ideas in Meteorology"; Chemistry, Prof. C. H. Desch on "The Chemistry of Solids"; Geology, Prof. W. A. Parks, on "Cultural Aspects of Geology"; Zoölogy, C. Tate Regan on "Organic Evolution: Facts and Theories"; Geography, A. R. Hinks on "The Science and Art of Map Making"; Economic Science and Statistics, Lynda Grier on "The Meaning of Wages"; Engineering, Sir A. Denny on "Fifty Years' Evolution in Naval Architecture"; Anthropology, Dr. T. Ashby on "Practical Engineering in Ancient Rome"; Physiology, Prof. A. V. Hill on "Physiological Basis of Athletic Records"; Psychology, Prof. C. Spearman on "Some Issues in the Theory of 'G'"; Botany, Prof. J. Lloyd Williams on "The Phaephyceae and their Problems"; Educational Science, W. W. Vaughan on "The Warp and Woof of Education"; Agriculture, Dr. J. B. Orr on "The Mineral Elements in Animal Nutrition."

**BRITISH COLUMBIA.** A province of Canada on the Pacific Ocean, lying between Alaska and Alberta. Area, 355,855 square miles; population, 1921 census, 524,582 as compared with 392,480 in 1911. The principal cities and their populations in 1921: Victoria, the capital, 38,727; Vancouver, 117,217; New Westminster, 14,495. In 1923 there were 10,834 births and 4748 deaths in the province. There is a complete system of free and non-sectarian education, ranging from primary to collegiate instruction. The area of the timberland of British Columbia is

estimated at more than 100,000,000 acres, containing roughly 400,000,000 feet of merchantable timber. The mineral resources are abundant. Down through 1923 the value of all mineral products amounted to approximately \$810,722,782. For figures pertaining to agriculture and manufactures see CANADA. The 1923-24 budget figures show a revenue of \$19,637,710 and expenditures of \$21,476,272. The government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The province is represented in the Canadian legislature by six members in the Senate and 13 in the House of Commons. Lieutenant-governor at the beginning of 1925, W. C. Nichol; prime minister, John Oliver. See CANADA.

**BRITISH EAST AFRICA.** A possession of Great Britain covering a large area of Africa, and comprising KENYA COLONY, UGANDA PROTECTORATE, and ZANZIBAR. See these articles.

**BRITISH GUIANA,** gē-ū'nā. A colony of Great Britain on the northeastern coast of South America, including the settlements of Demerara, Essequibo, and Berbice; bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, at the census of 1921, 297,691, excluding about 9700 aborigines in the remoter districts; population in 1911, 296,000. An official estimate of the population in 1923 placed it at 299,199. In the same year the movement of population was: Births, 9109; deaths, 8468. Capital, Georgetown, with a population of 55,638. Agriculture is the chief pursuit and the most important products are sugar, rice, and coconuts. Stock raising is also of importance. The number of cattle in 1923 was estimated at 102,200. The mineral resources are considerable, gold, rough diamonds, and bauxite, being found in large quantities. Oil is believed to exist in certain parts of the colony. The principal exports are sugar, rough diamonds, rice, timber, and rum; and the chief imports are flour, fertilizers, machinery and hardware, and textiles. Statistics for 1923 and 1924 are:

	1923 £	1924 £
Imports .....	2,668,961	1,829,053
Exports .....	8,757,647	8,106,806

The United Kingdom, Canada, and the United States stand in the order named in the matter of exports and imports. The revenue for 1923 was £1,114,704 and the expenditure £1,081,549. Customs duties provide more than half of the revenue. In 1923, 3119 vessels with a total tonnage of 1,070,822, entered and cleared, as compared with 3060 vessels in 1922 of 916,007 tons. Practically all the vessels were British and Dutch. The colony is administered by a governor assisted by an executive council and a legislative body of seven official and eight elected members. Governor at the beginning of 1925, Sir Graeme Thomson (appointed in 1922).

**BRITISH HONDURAS,** hōn-dō's'ras. A crown colony of Great Britain on the Caribbean coast of Central America, east of Guatemala and 700 miles west of Jamaica. Area, 8598 square miles; population at the census of 1921, 45,317; estimated population, Jan. 1, 1924, 46,527. The movement of population in 1923 was: Birth rate,

37.91 per thousand; death rate, 20.50 per thousand; marriages, 360. In 1923 the primary schools numbered 65 with an average attendance of 5250. Although only a small part of the land is cultivated, agriculture and forestry form the chief pursuits. The chief sources of wealth are mahogany, logwood, cacao, and fruits (mainly citrous fruits and bananas). In the higher lands good pasturage is to be found. The chief exports in 1924 were bananas, mahogany, cedar and other forest products, plantains, and chicle. The chief imports were clothing, cotton and silk goods, milk, flour, machinery and hardware. In that year as in the previous, the United States led all other countries in respect both to imports and exports. The accompanying table gives the statistics of finance and commerce:

	1922-23	1923-24
	£	£
Revenue .....	234,059	224,928
Expenditure .....	226,114	247,576
Imports .....	692,716	830,594
Exports .....	593,178	657,794

The public debt in 1923-24 was £232,941. The tonnage entered and cleared in 1923 was 536,931 of which 153,975 were British. The administration is under a governor assisted by an executive council of six members and a legislative council of five official and seven unofficial members. Governor and Commander-in-Chief in 1925, Maj. J. A. Burdon.

**BRITISH INDIA.** See INDIA, BRITISH.

**BRITISH MUSEUM. WORK IN ARCHAEOLOGY.** See ARCHAEOLOGY.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** A colony of Great Britain, comprising the northern part of the island of Borneo. Area, about 31,106 square miles; population, according to the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior, the Europeans numbering only 533. The Dusuns were the most numerous tribe at the census of 1921, numbering 112,287. The tribes next in numerical importance were the Muruts and the Bajaus. The chief towns are Sandakan, with a population of 11,936, on the east coast, and Jesselton on the west coast.

Only a small part of the soil is arable. The principal products are: Timber, coconuts, rye, sago, gum, coffee, fruits, spice, gutta-percha, camphor, rattans and other forest products, and tobacco. Coal, iron, gold, and mineral oils are also to be found to some extent. The trade is almost entirely limited to Great Britain and her colonies and is carried on chiefly through Hong Kong and Singapore. There is a railway 127 miles long running from Jesselton to Melalap, with a branch to Brunei Bay. Statistics of finance and trade for 1922 and 1923 are:

	1922	1923
	£	£
Revenue .....	361,044	357,404
Expenditure .....	241,784	344,779
Imports .....	800,933	770,987
Exports .....	957,338	1,213,485

The tonnage entering in 1923 was 294,829. The territory is under the jurisdiction of the British North Borneo Company, and the administrative functions are exercised by a governor in

Borneo and a board of directors in London. Governor at the beginning of 1925, Maj.-Gen. Sir W. H. Ryecroft.

**BRITISH SCHOOL AT ATHENS.** See ARCHAEOLOGY.

**BRITISH SOMALILAND.** See SOMALILAND, BRITISH.

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, UNION OF.

**BRITISH WEST AFRICA.** The general name given to the following colonies of Great Britain in West Africa: Nigeria (colony and protectorate); Gold Coast (comprising the Gold Coast colony, Ashanti and the Northern Territories); Sierra Leone (colony and protectorate). See separate articles.

**BROADCASTING.** See RADIO; AGRICULTURAL EXTENSION WORK.

**BROMINE.** See CHEMISTRY, INDUSTRIAL; also PHYSICS.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution, founded in 1824, conducting three departments, that of Education, that of Museums, and a Botanic Garden. Membership is open to all who are interested in any branch of science or art. The institution, in its present form, was incorporated in 1890. Educational courses are conducted in several departments, each forming a society composed of members interested in its particular field. Among the departments are Agriculture; Fine Arts and Architecture; Astronomy; Botany; Dramatic Art; Electricity; Engineering; Home Economics; Music; Philology; French Language and Literature; and Psychology. Addresses, lectures, and concerts are held by the departments with small fees for admittance. A forum conducted by the departments of Political Science and Sociology, provides for the discussion of current problems. The Museum exhibits collections in the fields of art, ethnology, and natural science. Its library contains over 24,000 volumes. Fifty acres are devoted to the Botanic Garden. The institution's permanent funds in 1925 totaled \$1,984,480.25, and those to meet current expenses, \$658,932.05. Attendance at lectures and concerts was 298,138; that at all activities of the institute 310,154. The president of the Board of Trustees in 1925 was Frank L. Babbott. Charles D. Atkins was director of the Department of Education; William Henry Fox of the Museum of Arts and Sciences; and C. Stuart Gager of the Botanic Garden. Headquarters are at The Brooklyn Academy of Music, Lafayette Avenue, Brooklyn, N. Y.

**BROWN-TAIL MOTH.** See ENTOMOLOGY, ECONOMIC.

**BROWN UNIVERSITY.** An institution of higher learning at Providence, R. I.; founded in 1764. The 1925 fall enrollment was 1577. The registration of the Women's college, which is a separate unit, was 463. The faculty numbered 157. The permanent productive funds amounted to \$8,352,373.80; the temporary funds to \$727,386.26; and the income for the year to \$1,746,609.64. During the year \$150,000 was acquired for new buildings. There were 330,000 volumes in the library. President, William H. P. Faunce, LL.D.

**BRULET, PAUL.** French author and publicist, died November 25. He was born at Saint-Jean-de-Muzols, Ardèche, May 26, 1866, educated at the Lycée of Marseilles, and was

*licencié en droit*. Among his works were *L'Amerrante*; *La rédemption*; *L'Ennemie*; *Le Reporter*; *La Faiseuse de gloire*; *La Gangue*; *Eldorado*; *Rina*; *L'Aventure de Cabusson*; *La Vie de Riette*; *L'Etoile de Joseph*.

**BRUNEL**, brōō-nī'. A British region on the northwestern coast of the island of Borneo. Area, about 4000 square miles; population (census of 1921), 25,444, of whom the Europeans numbered only 35, the bulk of the population being made up of Malays and native Borneans. Brunei is the chief town, with about 10,000 inhabitants. Among the chief products may be mentioned mangrove extract, rubber, coal, sago, and jelutong. Among the native industries are cloth-weaving, silverware, brass-founding, and boat building. In 1923 the chief imports were rice, tobacco, piece goods, sugar, kerosene oil; the chief exports, cutch, coal, rubber, jelutong, and forest products. The public debt on Dec. 31, 1923, was £51,333. The administration is in the hands of a British Resident, the sultan retaining the name only and receiving with his two principal ministers a subsidy from the British government. Sultan at the beginning of 1925, Sir Mohamed Jamal-ul-alam; British Resident, E. E. F. Pretty.

**BRUNNER**, ARNOLD WILLIAM. American architect, died February 14. He was born in New York City, Sept. 25, 1857, and after an education at the public schools of that city and at Manchester, England, he studied at the Massachusetts Institute of Technology from 1877 to 1879. He was a designer of many well known public buildings and in this work gained considerable knowledge in the planning and improvement of cities so that he was looked upon as a competent adviser in this field. He was the architect of the Capitol Park State Buildings; Soldiers' and Sailors' Memorial Bridge at Harrisburg, Pa.; U. S. Post Office, Custom House and Court House, Cleveland, O.; the Stadium, College of the City of New York; the Students' Building of Barnard College; the School of Mines at Columbia University; Mt. Sinai Hospital, New York City; the Cadet Hospital at West Point; the Monumental Bridge at Toledo, O.; and many other public buildings in addition to being a member of commissions to prepare city plans for Baltimore, Rochester, Denver, and other cities. He was a member of the Board of Education of New York City, 1902, and 1908-1910 he was a member of the Art Commission of that city. He was elected an Associate of the National Academy in 1910 and a member in 1916. He was appointed by President Roosevelt a member of the National Council of Fine Arts and served as President of the New York Chapter of the American Institute of Architects of which he had long been a fellow. In 1903-1904 he was President of the Architectural League of New York which he had assisted in founding and he was a member and officer of many other organizations such as the National Institute Arts and Letters, the National Sculpture Society, American Civic Association, and the Fine Arts Federation of New York City.

**BRYAN**, WILLIAM JENNINGS. American orator, political leader and Secretary of State, died July 26. He was born at Salem, Ill., March 19, 1860 and after graduating at Illinois College with the highest honors and the degree of A.B. in 1881 he studied law at the University College of Law in Chicago where he received his LL.B.

in 1883. He was admitted to the Illinois Bar in 1883 and practiced at Jacksonville in that State until 1887. October 1, 1884, he married Mary Elizabeth Baird of Perry, Ill., and in 1887 removed to Lincoln, Neb. From 1891 to 1895 he represented the First Nebraska District as a Democrat in the House of Representatives, where he soon became known as an eloquent speaker and an effective debater. He opposed the protective tariff and favored free and unlimited coinage of silver. In 1893 he was nominated in the Democratic State Convention for United States Senator, but defeated by John M. Thurston. In 1894 he became editor of the *Omaha World-Herald*.

Elected a delegate to the Democratic National Convention in 1896, Bryan advocated free silver before that body, writing the "silver plank" in the platform. On July 10, an eloquent speech in which Mr. Bryan delivered his famous declaration, "You shall not press down upon the brow of labor this crown of thorns—you shall not crucify mankind upon a cross of gold!" carried the convention by storm. On the following day he was nominated for the Presidency. The issue of the resulting campaign was clean-cut and Bryan traveled over 18,000 miles delivering speeches at almost every stopping place. At the election he was defeated by William McKinley, receiving 176 electoral votes against 271 for his opponent.

In 1898 at the outbreak of the Spanish-American War Bryan raised the Third Regiment of Nebraska Volunteer Infantry of which he became Colonel. At the conclusion of the War he showed interest in peace and peace movements. His influence was used with Democratic members of the Senate to secure the ratification of the treaty with Spain. In 1900 he advocated the independence of the Philippine Islands and made "Imperialism" the paramount issue. Again he received the Democratic nomination and again was defeated receiving 155 electoral votes against 292 for McKinley. The issues of imperialism and opposition to American sovereignty in the Philippines secured adoption as fundamental principles of the Democratic party, figuring in subsequent platforms. After the election of 1900 Bryan established at Lincoln, Nebraska, a political magazine of wide circulation, *The Commoner*. In 1904 the conservatives of the East, controlling the Democratic Convention, avoided Bryan and nominated Judge Alton B. Parker of New York for the Presidency. In 1905 Mr. Bryan started on a tour of the world. He was well received at European capitals. On his return he delivered a speech at Madison Square Garden, New York City, in which he brought forth the new issue of the nationalization of American railroads. This doctrine alienated what little support he enjoyed from conservative elements, but increased his popularity in the West and South.

At the Denver Convention in 1908 he was nominated for the third time and received 162 electoral votes against 321 for William Howard Taft. In the Baltimore Convention, June 25 to July 2, 1912, Bryan as before represented the liberal wing of the party against the conservative interests of the East and particularly of New York. He rendered impossible the nomination of Champ Clark, the leading candidate of the West and South, and prevented the choice of a conservative candidate. He was defeated in the contest for the chairmanship but he was able

© *Harris & Ewing*

WILLIAM JENNINGS BRYAN

to force that body to make its nomination before the platform had been adopted. His support was given to Woodrow Wilson, and Wilson's nomination undoubtedly was due to Bryan's efforts. Following the election of Wilson, Bryan was made Secretary of State. He was confronted by strained relations with Mexico, the Japanese alien land controversies in California, and soon afterward with difficulties arising out of the European War. The Mexican embroglio resulting from an insult to the American flag and the refusal of President Huerta to fire a salute in apology, led to the capture of Vera Cruz. Mr. Bryan after the passage of the California alien land law, which aroused the bitter opposition of the Japanese, visited California, held conferences with the Governor and spoke before the legislature. The passage of the Webb law modifying the restrictions against the Japanese in California somewhat improved matters. The most notable achievement of Mr. Bryan's career as Secretary of State was his advocacy of peace and his negotiation of some thirty treaties looking to the furtherance of peaceful relations by the investigation of all disputes.

On June 9, 1915, Bryan submitted his resignation as Secretary of State to President Wilson, and continued his work unofficially to further peace. His various pacifistic utterances and writings were held to favor the propaganda of the Central Powers. He not only opposed loans to the belligerents, but in an address at San Francisco he said for the United States to go to war with Germany would be "like challenging a mad house." When the United States entered the War in 1917 Mr. Bryan promptly declared that Germany must be defeated at all costs and offered his services to President Wilson as a private soldier.

At the Democratic Convention in St. Louis in 1916 Mr. Bryan was without influence. During his services as Secretary of State Bryan was frequently heard in lecture courses and on Chautauqua circuits where he said it was necessary for him to speak in order to eke out his salary and to support his family. He also became prominent as a thoroughgoing teetotaler, eliminating wine at official banquets. His personal influence did much towards the subsequent adoption of the 18th Amendment. During the years of the War Mr. Bryan was not conspicuous, and at the Democratic Convention in 1920 although a delegate-at-large from Nebraska he played a comparatively small rôle. He was beaten in his attempt to get a dry plank into the party platform and would not support Cox, the nominee, though he did not oppose him. After the election of Harding, Mr. Bryan made the suggestion that President Wilson should resign and that Vice President Marshall in turn should appoint Senator Harding Secretary of State and then resign himself. After 1920 Mr. Bryan became a legal resident of Miami, Florida, and was credited with having made a substantial fortune by his investments in Florida real estate. Elected a delegate to the Democratic Convention of 1924, from Florida, he opposed a resolution denouncing the Ku Klux Klan and advocated the nomination of Mr. William G. McAdoo, but he was not able to break the deadlock over nominations.

In latter years Bryan became active in the religious controversies involving the modern and so-called fundamental views of the Bible and Christian faith. He was a thorough fundamen-

talist and was active in discussions in the Presbyterian Church and in various writings dealing with the subject. In July, 1925, he came before the public prominently in connection with the prosecution of John Thomas Scopes in Dayton, Tennessee, a school teacher charged with violating a State law forbidding the teaching of evolution in schools and colleges receiving support from that State. Bryan aided the prosecution and was a leading influence in the conduct of the case. At the trial he was placed on the stand as a fundamentalist and was examined by Clarence Darrow, of counsel for the defense, without, however, appearing to his usual advantage. At the conclusion of the trial he attended services at the Southern Methodist Church in Dayton on Sunday, July 26, and led the congregation in prayer. On the same day he passed away in his sleep during the afternoon. He had prepared an address for the jury stating the fundamentalist side of the question, but this was not delivered and after his death was given to the press. It was considered a strong presentation of his side of the controversy, and was intended to meet comments elicited by his previous testimony and examination.

Bryan was an able orator, stimulated by hostile audiences whose opposition and interruptions encouraged him to redoubled efforts. He was a man of considerable sincerity, simple and practical, with a host of friends, even among those who disagreed with him. His death evoked expressions of regret from men of all classes. He was buried in Arlington National Cemetery, July 31. His writings include, *The First Battle* (1897); *Under Other Flags* (1904); *The Old World and Its Ways* (1907); *Heart to Heart Appeals* (1917); *The Menace of Darwinism*, and *The Bible and Its Enemies* (1921); *In His Image* (1922). After Mr. Bryan's death there was published *The Memoirs of William Jennings Bryan*, by himself and his wife, Mary Baird Bryan.

**BYRN MAWR COLLEGE.** An institution for the higher education of women at Bryn Mawr, Pa.; founded in 1880. The enrollment for the fall of 1925 numbered 508, including 399 undergraduates, distributed as follows: 89 seniors, 99 juniors, 104 sophmores, and 107 freshmen; 4 hearers, 17 resident fellows, and 88 graduate students. The faculty numbered 78. The productive funds of the institution (i.e. endowment, etc.) were \$6,381,505.42, and the income for the year amounted to \$754,885.93. In 1925 a \$500,000 fund was raised for the endowment of the Department of Music, and to permit of the building of a hall for student organizations and the Department of Music. The number of volumes in the library totaled 107,822. President, Marion Edwards Park, Ph.D., LL.D.

**BUBONIC PLAGUE.** See PLAGUE.

**BUCKNELL UNIVERSITY.** A coeducational institution located at Lewisburg, Pa. It was founded in 1846 as a Baptist denominational institution of liberal arts under the name of the University of Lewisburg, but in 1886 was renamed in honor of its benefactor, William Bucknell. The enrollment in the fall of 1925 was 1044, including 697 men and 347 women students, and for the summer school of 1925 the total registration was 292 students composed of 136 men and 156 women. The number of members of the faculty in the fall of 1925 was 65. The productive funds amounted to \$600,000, and

the income for the year was \$456,000. A campaign was in progress to increase the endowment fund to the amount of \$1,000,000. The number of volumes in the library was 50,000. President, Emory W. Hunt, D.D., LL.D.

**BUCKWHEAT.** The production of buckwheat in the United States in 1925, as estimated by the Department of Agriculture, amounted to 14,647,000 bushels produced on 776,000 acres, or at the rate of 18.9 bushels per acre. In 1924 the production was 13,277,000 bushels, the area 738,000 acres and the average yield per acre 18 bushels. The average farm price Dec. 1, 1925, was 89.2 cents per bushel as compared with \$1.03 Dec. 1, 1924. The production of buckwheat was reported from twenty-five States, the leading States and their yields being as follows: Pennsylvania 4,853,000 bushels, New York 4,465,000 bushels, Minnesota 854,000 bushels, Michigan 754,000 bushels, West Virginia 576,000 bushels, and Wisconsin 560,000 bushels. The average yields for the different States ranged from 12 bushels per acre in South Dakota to 26 bushels in Maine. The average price on Dec. 1, 1925, in the different States ranged from 70 cents in South Dakota to \$1.15 in Connecticut and Tennessee. A study reported by the West Virginia Agricultural Experiment Station showed that in 1922 in the principal buckwheat-producing sections of the State the cost of production was \$21.39 per acre (West Virginia Agricultural Experiment Station Bulletin 187, 1924). The exports of buckwheat of the United States for the year ended June 30, 1925, amounted to about 180,000 bushels and of buckwheat meal and flour to about 310,000 pounds and the import of buckwheat and buckwheat products to approximately 26,000,000 pounds. On the world's production of buckwheat, data, as a rule, are not available.

**BUILDING.** See ARCHITECTURE; CITY AND REGIONAL PLANNING.

**BUILDING AND LOAN ASSOCIATION.** See COOPERATION.

**BUKOWINA,** bú'kó-vě'na. A former crown-land in the Austrian-Hungarian Empire, which was annexed to Rumania on the fall of the Central Powers in 1918-19. Area, 4030 square miles; population, 800,098. It is represented in the Rumanian legislature by 19 senators and 16 deputies.

**BULGARIA.** A constitutional monarchy in the Balkans lying to the south of Rumania and the east of Serbia. Capital, Sofia.

**AREA AND POPULATION.** The area of Bulgaria in 1923 was 39,814 square miles. Before the war it was 53,305 square miles. The estimated population on Jan. 1, 1924, was 5,115,906, as compared with the estimated population of 5,008,000 a year previous, and 4,861,439 according to the census of 1920. The Bulgarians made up about three-fifths of the total population at the census of 1910, the other racial elements in the order of their numerical importance being at that time Turks, Gypsies, Rumanians, Greeks, and Jews. The movement of population in 1923 was: Births, 182,801; deaths, 103,196; surplus of births, 79,105. The chief cities with their populations according to the census of 1920 were: Sofia, 154,025; Philippopolis, 63,418; Varna, 50,819; Ruschuk, 41,574; Slivno, 28,590; Plevna, 27,446; Stara Zagora, 25,491; Choumen, 23,975; Burgas, 21,170.

**EDUCATION.** Education is free and compulsory

between the ages of 7 and 14, and is supported by the state authorities. In 1922-23 there were 3968 public elementary schools, with 13,027 teachers and 509,290 pupils. There were also 1625 private elementary schools with 2362 teachers and 83,013 pupils. Secondary and higher schools are gymnasiums, progymnasiums, and various institutions for special instruction and the training of teachers. The state university at Sofia in 1923 had 199 professors and teachers and 2707 students. There is also a free university with 44 teachers and 1512 students.

**PRODUCTION.** Agriculture is the chief occupation of the people and the land is held in absolute freehold, the greater part of the holdings being under small proprietors (one to six acres). Two-thirds of the population are engaged in working the 9,182,409 acres of cultivated land. The accompanying table from the *Statesman's Year Book* for 1925 shows the acreage and yield of the cereal crops for 1924:

Cereals	1924	
	Area Acres	Yield Tons
Wheat .....	2,491,015	770,681
Rye .....	418,715	112,121
Meslin .....	218,007	75,775
Barley .....	581,072	172,983
Oats .....	377,662	107,494
Spelt .....	20,697	5,891
Millet .....	21,277	7,514
Maize .....	1,482,052	692,549
Rice .....	9,815	6,004
Total .....	5,570,802	1,951,012

Fruit is also raised in large quantities especially around Kustendil; 187,345 acres were under the vine, from which were produced 195,596 tons of grapes and 9,440,000 gallons of wine. Cotton, honey, sugar, and tobacco are also raised to some extent. Considerable advance was made in the mining industry after the war, 1,063,662 metric tons of coal being mined as against an average pre-war yield of 125,000 tons. Copper, salt, iron, manganese, and lead production were also considerable. Manufacturing is rather backward, although the government encourages industrial enterprises. In 1922 there were 1644 industrial concerns employing 55,431 hands.

**COMMERCE.** The accompanying table from the *Statesman's Year Book* for 1925 shows the trade by principal countries for 1922 and 1923:

Country	Imports	
	1922 Leva	1923 Leva
United Kingdom .....	604,322,265	811,758,778
Austria .....	839,788,668	422,503,721
Belgium .....	150,548,849	247,088,121
Germany .....	869,706,200	1,014,129,850
France .....	308,953,885	513,919,937
Italy .....	496,784,297	845,265,018
Turkey .....	299,335,216	199,866,810
United States .....	75,038,388	92,257,608
Greece .....	127,121,904	118,089,822
Total (all countries) .....	4,087,662,058	5,120,659,945

Country	Exports	
	1922 Leva	1923 Leva
United Kingdom .....	30,445,123	27,888,850
Austria .....	216,433,400	511,751,571
Belgium .....	173,085,896	83,230,059
France .....	308,958,885	513,919,937

Greece .....	304,834,919	212,962,455
Total (all countries) .....	4,829,718,046	5,587,184,795

The chief articles of imports were: Textiles, metals, oils, skins, tar, and machinery; exports, tobacco, maize, attar of roses, hides, wheat and barley. With regard to the trade in 1924 the United States Bureau of Foreign and Domestic Commerce reported that the exports were: 4,902,538,000 leva and the imports 5,557,311,000. Although an unfavorable balance was shown it was thought that undervaluation of tobacco exports may be accountable and that in reality Bulgaria may make a reasonable claim to a substantial trade balance for 1924. Agricultural products constituted 90 per cent of the exports. Germany occupied first place in both exports and imports in the country's foreign trade.

**FINANCE.** The budget for 1924-25 provided a revenue of 6,604,250,000 leva and an expenditure of 6,604,931,000 leva. The principal sources of revenue were direct and indirect taxes and income from state monopolies (railways, harbors, post, telephones and telegraphs). The chief articles of expenditure were public debt, war department, state monopolies, and execution of the peace treaty. The budget for the fiscal year 1925-26 as passed by the Sobranje provided for the balancing of the budget at 6,875,000,000 leva. Among the expenditures were listed 1,387,955,731 leva for public debt; 1,232,069,480 for ministry of war; and 869,033,640 leva for the department of ports and railways. The revenue included 2,970,000,000 leva from indirect taxation, 890,000,000 from direct taxes, and 1,080,000,000 leva from railways and ports.

**COMMUNICATIONS.** The vessels entered at the Black Sea ports of Bulgaria in 1923 numbered 3813 of 1,654,120 tons; cleared, 3651 of 1,637,448 tons; Danube ports, entered, 6407 vessels of 1,161,666 tons, and cleared, 6360 vessels of 1,157,982 tons. In 1922 Bulgaria had a total railway mileage of 1624, all belonging to and operated by the state.

**GOVERNMENT.** At the head of the government is the king, assisted by a council of ministers nominated by him, and a single legislative chamber known as the Sobranje composed of 227 members. In 1925 the king was Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918. The parties of the Sobranje at the beginning of 1925 following the last election, November, 1923, were distributed among the political groups as follows: Government Coalition, 210; National Liberals, 8; Agrarians, 39; Communists, 99; Radicals, 14; Socialists, 30. The ministry as constituted in March, 1925, was as follows: Premier and Minister of Education, Alexandre Tzanoff; Interior and Public Health, Ivan A. Rouseff; Justice, Tzvetco P. Bobochevski; Commerce, Dimitri Christoff; Finance, Peter Todoroff; Public Works, Yanko Stoencheff; Posts and Railways, Rachko Majaroff; Foreign Affairs, Christo Kalfoff; Agriculture, Yanaki Molloff; War, Col. Ivan Velcoff.

## HISTORY

**REVOLUTIONARY DISORDERS.** The struggle between the government and the communists which was noted in the preceding YEAR BOOK continued intermittently throughout the early part of 1925. On February 13, Nicola Milev, who had been named Bulgarian minister to the United States to succeed Stephan Panaretov, was slain in the streets of Sofia. A short time later the com-

munist deputy, Todor Strachimirov, was assassinated, apparently as a retaliatory measure. Milev was a bitter opponent of communism. On March 6 a second communist deputy, Haralamy Stoyanov, was slain. The government press attributed this act to revenge for the slaying of Milev. The communist outbreak was followed by the usual results—wholesale arrests, announcements of the discoveries of Bolshevik plots, etc. Communist bands crossed the Jugo-Slav border and attacked peaceful villages. The purpose of these forays was obviously to embroil the government with its neighbors. On February 24 martial law was declared in all the provinces that bordered on Jugo-Slavia and plans were laid to suppress all Bolshevik and Agrarian newspapers. On March 11 the government requested the Council of Ambassadors for permission to increase the size of the army by 4000 beyond the limits placed by the treaty of Neuilly in order to effectively handle the uprisings. On the 20th of the same month the parliament expelled six of its communist members.

On April 14 the request of the Tsankov government for additional troops was granted by the Council of Ambassadors. On the same day an attempt was made on the life of King Boris III as he was touring between Sofia and Orhanie. He was unharmed but two of his entourage were killed. General Gheorghiev, who was largely responsible for the overthrow of the Stambulski government, was assassinated in the capital on the same day. Two days later when his funeral was being held in a cathedral in Sofia, the church was bombed and about 160 lives were lost in the explosion and wreck. Prime minister Tsankov was injured. Martial law was immediately proclaimed, thousands were arrested, and many were killed in the search for the criminals. The Council of Ambassadors permitted the militia to be increased by an additional 7000 men. Sentence of death was imposed upon more than twenty conspirators, who were convicted of complicity in the hideous crime. On May 4 the government announced that all communists had been outlawed and that all of their organizations would be exterminated. Documents were purported to have been found which fixed the responsibility for the cathedral outrage on the Soviet government of Russia. On May 30 the extra troops permitted by the Council of Ambassadors were ordered disbanded by the Council. It was not until October 19 that the government saw fit to terminate the period of martial law which had been declared as a result of the cathedral outrage.

**TROUBLE WITH GREECE.** For a short time in October it seemed that the flames of war would spread over the Balkan peninsula again. On October 19 a band of Bulgarian Guerillas crossed the Greek frontier and attacked a Greek post at Demir-Hissar. This act was followed by the invasion of Bulgarian territory and spasmodic fighting along the frontier. The Greek government issued a forty-eight hour ultimatum demanding an indemnity of 2,000,000 gold French francs from Bulgaria and an apology and conviction of those responsible for the act of October 19. In the meantime the Greek army was advancing into Bulgarian territory, although the Bulgarians offered no resistance. On October 23, Aristide Briand, acting president of the Council of the League of Nations, warned the two countries to stop fighting and to send repre-

sentatives to a meeting to be held in Paris on October 26. At the meeting on that date the Council ordered a cessation of hostilities and immediate withdrawal of Greek troops from Bulgarian territory. A commission was appointed to investigate the difficulty and on December 3 it recommended that Greece pay an indemnity of 20,000,000 leva because of damages suffered by Bulgarian civilians and 10,000,000 leva for the killing of wounded soldiers and other moral or material damages.

**BUNKER HILL SESQUICENTENNIAL.**  
See CELEBRATIONS.

**BURGE, Rt. Rev. Hubert Murray.** Anglican Bishop of Oxford since 1919, died at Oxford on June 11. He was born Aug. 9, 1862, son of Rev. M. R. Burge of Fort William, Calcutta, and was educated at Bedford Grammar School, at Marlborough, and at University College, Oxford, where he was a scholar, taking a first class in Mods in 1883 and a second in Lit. Hum. in 1886. Leaving Oxford he became Sixth Form master at Wellington College under Dr. Wickham, but in 1890 he returned to Oxford, being made fellow and tutor of University College where he was appointed Dean in 1895. In 1897 he was ordained deacon and became priest in the following year. In 1900 he became Headmaster of Repton School and in the following year was made Headmaster of Winchester, succeeding Archdeacon Fearon. Dr. Burge's work during the ten years he was at this institution resulted in many beneficial developments, particularly in the line of encouraging the boys to strengthen or develop their strongest powers and to increase their interest in artistic or cultural subjects. In 1911, having left Winchester for a period of rest, he was appointed by Mr. Asquith Bishop of Southwark where he served until 1919 when he succeeded Dr. Gore as Bishop of Oxford. Dr. Burge's first Bishopric was administered with energy and sympathy. When he became Bishop of Oxford he not only was an influence in the see where the University was prominent, but he was called upon for advice on matters of educational reform and national policies. His diocese was administered with sympathy and sagacity. He was the recipient of many honors. He was ex-officio Chancellor of the Order of the Garter, and in 1907 he was elected honorary fellow of University College. In 1909 he was made Chaplain of the Order of St. John of Jerusalem in England and Sub-Prelate of the same order in 1911. In 1918 he was appointed Clerk of the Closet in Ordinary to his Majesty succeeding Bishop Boyd Carpenter. The Bishop of Oxford enjoyed a special reputation for fairness, sympathy and simplicity and he had a remarkable influence and appeal to the laity both through his preaching and for his general character.

**BURGESS, Rt. Rev. Frederick.** Protestant Episcopal Bishop of Long Island, died October 15. He was born at Providence, R. I., Oct. 6, 1853, and after graduating at Brown University in 1873 studied at the General Theological Seminary in New York, 1874-75. He was in Oxford, England, in 1876 in which year he was made deacon and was ordained priest in the Protestant Episcopal Church in 1877, serving as rector at Mendham, N. J. In 1878 he went to Grace Church, Amherst, Mass., and was rector there until 1883 when he went to Christ Church,

Pomfret, Conn., serving there until called to St. Asaph, Bala, Pa., in 1889. He was rector of Christ Church, Detroit, 1896-98, and in the latter year went to Grace Church, Brooklyn, where in 1902 he was elected and consecrated bishop of Long Island. Failing health marked the latter part of his life and the Rev. Dr. Ernest E. Stires of St. Thomas' Church, New York City, was elected to aid him as bishop coadjutor, succeeding to the bishopric on Bishop Burgess' death.

**BURKE, THOMAS.** American jurist, died suddenly in New York City, December 4. He was born in Clinton County, N. Y., Dec. 22, 1848, and graduated at the Academy, Ypsilanti, Mich., in 1870, becoming a student of the literary department of the University of Michigan in 1870, from which in the following year he transferred to the law department where he studied in 1871-72. He was admitted to the bar in 1873, and removing to Washington was in active practice in Seattle from 1875 with the exception of the years 1876-80 when he was judge of the Probate Court, King County, Washington; and from 1888 to April, 1889, when he was chief justice of the Supreme Court. He was president of the Seattle Chamber of Commerce, 1914-15, and of the Associated Chambers of Commerce of the Pacific Coast. In 1910 he became a trustee of the Carnegie Endowment for International Peace. It was while making an address in favor of "justice, courtesy and kindly treatment for Japan" before the board of trustees of the Carnegie Endowment for International Peace that he was fatally stricken. He received the degree of LL.D. from Whitman College, Washington, in 1902.

**BURMA.** The largest and most easterly provinces of British India. Area, about 233,707 square miles; population, according to the census of 1921, 13,212,192, as compared with 12,115,217 in 1911. Rangoon, with a population of 341,962, is the capital of Lower Burma; and Mandalay, with a population of 148,917, is the capital of Upper Burma. The inhabitants comprise nine racial groups, the Burman being predominant, and the language spoken by about 8,000,000 is Burmese. See INDIA.

**BURNLEY, CHARLES FOX.** Oriel Professor of the Interpretation of Holy Scripture at Oxford University and Canon of Rochester, died at Oxford in April. He was born Nov. 4, 1868, and was educated at St. John's College, Oxford, where he took high honors in theology and oriental studies. In 1893 he was elected Senior Scholar of St. John's College and Lecturer in Hebrew, and was ordained to the curacy of All Saints, Oxford. In 1899 he was elected a fellow at St. John's and was frequently a lecturer in the University as well as at other colleges. He was examining chaplain to the Bishop of Southwell from 1904 to 1914, and Select Preacher at Cambridge University in 1922. In 1914 he was appointed Oriel Professor of the Interpretation of Holy Scripture in Oxford and in 1922 he received the honorary degree of D.D. from Durham, having previously taken the degree of D. Litt. from Oxford. He was considered the foremost Old Testament Semitic scholar in Great Britain having not only a profound knowledge of Hebrew, but also an intimate acquaintance with Syriac, Aramaic, Arabic, and Assyrian. An early work, *Outlines of Old Testament Theology*,

first published in 1899, went through many editions, while his lectures on *Israel's Settlement in Canaan: The Biblical Tradition and its Historical Background*, first published in 1918 have gone into a third edition. A second edition of his study of the *Book of Judges* was published in 1920. His works furnished considerable light on Old Testament problems based on material from Babylonian sources. His most original work was *The Aramaic Origin of the Fourth Gospel* published in 1922 in which he presents the thesis that the Gospel according to St. John is a literal Greek translation of a gospel written in Aramaic by a Jewish Disciple of Christ and that its author was not John the son of Zebedee, but John the Presbyter, who is mentioned by Papias. He was the author of many articles in theological dictionaries and in encyclopædias, theological journals, and other publications.

**BURTON, ERNEST DEWITT.** American theologian and President of the University of Chicago, died May 26. He was born at Granville, Ohio, Feb. 4, 1856. He graduated at Denison University in 1876, at Rochester Theological Seminary in 1882, and studied at the Universities of Leipzig and of Berlin. From 1876 to 1879 he taught in academies and public schools, and in 1882 became instructor in New Testament Greek in Rochester Theological Seminary. In 1883 he joined the faculty of Newton Theological Institution and in 1892 became Professor of the Department of New Testament literature and interpretation at the University of Chicago. In 1910 he was made Director of the University Libraries, and in 1923 became President succeeding President Judson. Dr. Burton was an eminent scholar and theologian, having been editor of the *Biblical World*, managing editor of the *American Journal of Theology*, chairman of the China Educational Commission, and Oriental educational commissioner of the University of Chicago (1908-1909). Among his important works were: *Constructive Studies in the Life of Christ* (with Shailer Mathews) (1901); *Short Introduction to the Gospels* (1904); *Principles of Literary Criticism and Their Application to the Synoptic Problem* (1904); *Harmony of the Synoptic Gospels in English* (with Edgar J. Goodspeed) (1917); *Harmony of the Synoptic Gospels in Greek* (with Edgar J. Goodspeed) (1920); and *Source Book for the Study of the Teaching of Jesus* (1923). Dr. Burton received the degree of D.D. from Denison University in 1897, from Oberlin in 1912, and from Harvard University in 1920.

**BURTON, MARION LEROY.** An American educator, President of the University of Michigan, died February 18. He was born at Brooklyn, Iowa, Aug. 30, 1874. After graduating from Carlton College, Minnesota, in 1900 he taught in Minnesota schools until he entered the Divinity School of Yale University where he graduated with high honors in 1906, receiving the degree of Doctor of Philosophy in the following year. He was assistant professor of Theology at Yale for two years, became Pastor of the Church of the Pilgrims in Brooklyn, in 1908, and was elected President of Smith College in 1909. Here he served successfully until in 1917 he was elected President of the University of Minnesota, succeeding Dr. George E. Vincent. In 1920 he was called to the presidency of the University of Michigan, where he continued until his death.

He was selected to make the nominating speech for President Coolidge in June, 1924, and was recognized as a leader not only in education, but in sound and intellectual political thought. He was a trustee of the Carnegie Foundation for the Advancement of Teaching in New York, and a member of the Advisory Council of the Institute of International Education as well as of its administrative board. He was a believer in a well-balanced educational curriculum, and carried out an administrative system supplying the fullest coöperation between the governing body and the faculty. He strove for personal sympathy with the teaching staff; it was his aim to make the university of the greatest value to all people. He was an orator of force and pleasing personality, and his writings included: *The Problem of Evil* (1909), *The Secret of Achievement* (1913), *Our Intellectual Attitude in an Age of Criticism* (1913), *Life which is Life Indeed* (1914), *First Things* (1915), *On Being Divine* (1916), and various miscellaneous articles and addresses.

**CABLE, GEORGE WASHINGTON.** American author died, St. Petersburg, Florida, January 31. He was born at New Orleans, Oct. 12, 1844, and was educated in the public schools of that city. He served during the war in the 4th Mississippi Cavalry of the Confederate Army. After the war he was for a time a reporter for the New Orleans *Picayune* to which he had contributed occasional verses and critical and humorous pieces. He left newspaper life in 1879 and after a brief commercial experience devoted himself entirely to literature. His first important work was *Old Creole Days*, a collection of stories which had been published in *Scribner's Magazine* and which had met with a very favorable reception. They dealt with the picturesque life in early Louisiana. There followed a story entitled *The Grandissimes* (1880); *Madame Delphine* (1881); *The Creoles of Louisiana* (1884); *Dr. Sevier* (1885), a story of the Civil War, thought by many his best; *The Silent South* (1885); *Bonaventure* (1888); *Strange True Stories of Louisiana* (1889); *The Negro Question* (1890); *John March, Southerner* (1894); *Strong Hearts* (1899); *The Cavalier* (1901); *Bylow Hill* (1902); *Kincaid's Battery* (1908); *Posson Jone and Pere Raphael* (1909); *Gideon's Band* (1914); *The Amateur Garden* (1914); *The Flower of the Chapdelaines* (1918); and *Lovers of Louisiana* (1918). Cable moved to Northampton, Mass., where in 1887 he founded the Home Culture Clubs, later known as Northampton People's Institute, intended for the educational and æsthetic culture of wage-earning people. He was a member of the American Academy of Arts and Letters, and of the Simplified Spelling Board. He received the honorary degrees of A.M. (Yale, 1883), and Litt.D. (Washington and Lee, 1882; Yale, 1901; and Bowdoin, 1904).

**CALENDAR.** See **ASTRONOMY.**

**CALIFORNIA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 3,426,861. The estimated population on July 1, 1925, was 4,021,320. The capital is Sacramento.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Barley	1924	698,000	14,867,000	\$17,246,000
	1925	1,040,000	32,240,000	24,180,000
Wheat	1924	377,000	5,655,000	8,709,000
	1925	603,000	11,451,000	16,956,000
Hay	1924	2,104,000	4,729,000 <sup>a</sup>	102,224,000
	1925	1,928,000	5,621,000 <sup>a</sup>	71,556,000
Grain sorghums	1924	84,000	2,562,000	3,457,000
	1925	88,000	2,992,000	3,201,000
Corn	1924	86,000	2,907,000	4,012,000
	1925	85,000	3,026,000	3,571,000
Oats	1924	86,000	1,789,000	1,556,000
	1925	151,000	5,194,000	3,168,000
Rice	1924	90,000	4,365,000	7,246,000
	1925	103,000	4,738,000	8,055,000
Potatoes	1924	46,000	7,860,000	6,624,000
	1925	42,000	6,500,000	13,020,000
Sweet potatoes	1924	6,000	678,000	1,478,000

**MINERAL PRODUCTION.** California ranks among the first states in the value of its mineral products. The most important in point of value was petroleum, of which there was produced in 1923, 262,876,000 barrels, valued at \$242,731,000, compared with 138,468,000 barrels, valued at \$173,381,000 in 1922. The State ranked first in the production of petroleum. The estimated production in 1924 was 230,064,000 barrels, valued at \$250,000,000. The second mineral product in point of value was cement, of which there were produced, in 1923, 10,882,802 barrels, valued at \$26,022,156, compared with 9,041,788 barrels, valued at \$20,478,577 in 1922. The production, in 1924, was 11,615,000 barrels, valued at \$25,649,000. Natural gas was third in point of value. The production, in 1923, was 131,434,000 M cubic feet, valued at \$22,787,000, compared with 84,580,000 M cubic feet, valued at \$17,898,000, in 1922. The gold production of the State, in 1923, amounted to 647,210 fine ounces, valued at \$13,379,033, compared with 709,678 fine ounces in 1922, valued at \$14,670,346. The production in 1924 was 630,822 fine ounces, valued at \$13,041,500. There were produced, in 1923, 3,559,443 fine ounces of silver, valued at \$2,918,743, compared with 3,100,065 fine ounces in 1922 valued at \$3,100,065. The production in 1924 was 3,366,559 fine ounces, valued at \$2,262,596. The clay products of the State are of great value. These, in 1923, amounted to \$20,833,053, compared with \$14,689,830 in 1922. California produces a considerable amount of copper. The smelter output in 1924 amounted to 49,433,716 pounds. The production in 1923 was 28,317,759 pounds, valued at \$4,162,711. Other mineral products of value are magnesite, natural gas gasoline, natural gas, quicksilver, sand and gravel, and stone. The total value of the mineral products of the State, in 1923, amounted to \$381,010,424, compared with a value of \$283,411,997 in 1922.

In 1925 the total value of gold, silver, copper, lead and zinc produced in California, according to the preliminary estimate of the U. S. Bureau of Mines, was \$22,893,500, or a decrease of \$44,657, as compared with the value of metals produced in 1924. There was a decline in the pro-

duction of gold, silver, and copper, but a considerable increase in the output of lead and zinc over the previous year. The gold produced in 1925 was valued at \$13,015,600, or a decrease of \$134,575, over 1924, there being a decrease in the yield of several of the larger gold quartz mines and from copper mines. The production of silver totaled 3,096,080 ounces, valued at \$2,136,295, or 459,053 ounces less than in 1924. The production of copper in 1925 was 45,808,200 pounds, valued at \$6,458,956, a decrease of 6,298,971 pounds and a value of \$367,083 over the previous year. The lead mines of southern California had a total output of 7,011,000 pounds, valued at \$635,196, in 1925, or an increase of 2,247,194 pounds over the previous year. The output of zinc increased nearly threefold, amounting in 1925 to 8,651,900 pounds, valued at \$652,353. By far the greater part of the zinc was carried in form of concentrates, which were shipped abroad for reduction.

**FINANCE.** According to the summary of the United States Department of Commerce, the total expenditures for the fiscal year ending June 30, 1924, for the general departments of the State, amounted to \$54,551,389. In this amount were included apportionments for education to the minor civil divisions of the State, amounting to \$18,826,889. In addition there had been expended \$15,134,121 for expenses of public service enterprises, interest on debt, and outlays for permanent improvements, making a total payment for the year of \$75,507,798. This included all payments for the year, whether made for current revenue or from the proceeds of bond issues. Of the expenditures, \$18,589,377 was for the construction and maintenance of highways. The per capita expenditure for the maintenance of the general departments of the State was \$14.14 in 1924, compared with \$12.89 in 1923 and \$7.18 in 1918.

The total revenue receipts for the fiscal year 1924 amounted to \$66,982,354, which was \$6,545,877 more than the total payments of the year, exclusive of the payments for permanent improvements; but \$8,588,244 less than the total payments, including those for permanent improvements. Payments in excess of revenue receipts were met from the proceeds of the debt obligations. Of the total revenue for 1924, property and special taxes represented 22.4 per cent, compared with 20.5 per cent in 1923 and 23.7 per cent in 1918. The per capita property and special taxes in 1924 were \$3.88; in 1923, \$3.40, and in 1918, \$2.20. The chief sources of revenue, in addition to the general property tax, were earnings of general departments and business and non-business licenses. The total net indebtedness of the State on June 30, 1924, was \$91,980,605, or \$23.83 per capita, compared with \$21.72 per capita in 1923, and \$12.19 in 1918.

**TRANSPORTATION.** The railway mileage at the end of 1924 was 9167. There were constructed during the year about 30 miles of first track and about 23 miles of second track, or a total of about 50 miles of new construction.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$2,216,639,000, compared with \$1,758,682,000 in 1921 and \$219,279,000 in 1919. The average number of wage earners employed during 1923 was 246,975, compared with 198,334

in 1921 and 296,858 in 1919. The "lumber and timber products" industry was the leading one in the State as measured by the number of wage earners, but measured by the total value of products, the petroleum-refining industry was first in importance. This industry employed 7106 wage earners in 1923, compared with 5524 in 1921. The value of the petroleum-refining industry was \$267,383,000 in 1923, compared with \$258,746,000 in 1921, and \$213,292,000 in 1919.

**EDUCATION.** The most important feature in education during the year was the scientific study and reorganization of the elementary school curriculum in order to effect saving of time and the elimination of irrelevant subject matter. There was a notable increase during the year in the professional attitude on the part of all teachers, and a closer working unity of all groups for the up-building of local, State, and national interests. The total enrollment in the public schools, for the year 1924-25, was 1,085,083. Average salaries of teachers for the year were approximately \$2095. The total expenditures for public school education were approximately \$122,478,000, for the year 1924-25.

**CHARITIES AND CORRECTIONS.** The Department of Charities and Corrections was created in 1923 and has general charge of the State prisons, hospitals and industrial schools. Six State hospitals in 1925 had charge of about 12,000 insane persons. The legislature of 1925 passed no important measures relating directly to charities and corrections.

**LEGISLATION.** The legislature approved the Federal Child Labor Amendment. (See CHILD LABOR.) The civil service commission of three was abolished and was replaced by a single commissioner appointed by the governor, for a four years' term, removable by a concurrent resolution of both Houses by a two-thirds vote in each House. An adjusted compensation act for members of the legislature was passed. Courts were authorized to appoint experts, either before or during civil or criminal trials on request of any party, or on their own motion. The principle of classification of property for taxation was adopted by making a special class of intangibles which are assessed to a certain per cent of their full cash value. The measure was submitted to the people ratifying the Veterans' Welfare Bond Act. An important measure was the so-called California Canned Fruit Standardization Act. The act is authorized by the district attorney on criminal proceedings, if the board established finds products to be below the standard grade.

**POLITICAL AND OTHER EVENTS.** Except for the session of the legislature, there was nothing of especial political importance in the State in 1925. A Congressional election was held in February in the Fourth Congressional District comprising a part of the city of San Francisco, to fill a vacancy made by the death of former Congressman Julius Kahn, who died in 1924. Florence P. Kahn, his widow, was elected. The legislature in April, ratified the Child Labor Amendment.

Considerable national interest resulted from the action of the Supreme Court in October in refusing the appeal of Charlotte Anita Whitney, who as a member of the Communist Labor Party was convicted in November, 1919, after defying the police by making a speech at the Oakland Civic Center. She was sentenced to prison for

from one to fourteen years. The refusal of her appeal by the Supreme Court obliged her to serve her sentence unless she received a pardon from the governor. This action he would be unable to take unless Miss Whitney had signed an appeal implying confession of guilt. This she refused to do. Suit was brought by the United States Government at Los Angeles to cancel the lease of naval oil reserve lands made in 1922 to private interests. These suits were the outgrowth of the oil investigations of 1924. These suits were decided in favor of the Government, Judge McCormick deciding that the contracts were void for fraud and conspiracy.

Municipal elections were held in the State in November. In San Francisco nine supervisors were elected together with a city attorney, a public administrator, and other officers. Several questions were submitted to the people, among them a proposal to purchase the Market Street railway properties for \$36,000,000. This was defeated by a large majority. Another question at issue was the sale of power from the Hetch-Hetchy water project by the city to a private corporation, which should act as its distributor. This proposal was also rejected.

**OFFICERS.** Governor, Friend William Richardson; Lieutenant-Governor, C. C. Young; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Adjutant-General, Richard R. Mittelstaedt; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, Will C. Wood; Commissioner of Corporations, E. M. Daugherty; Librarian, Milton J. Ferguson; Legislative Counsel, T. M. Gannon; President Railroad Commission, H. W. Brundige; Chairman Industrial Accident Commission, John A. McGilvray; Commission of Insurance, George D. Squires; Chairman Highway Commission, Harvey M. Toy; Director Department of Agriculture, G. H. Hecke; Superintendent of Banks, John F. Johnson; Building and Loan Commissioner, Charles R. Detrick; Labor Commissioner, Walter G. Mathewson.

**JUDICIARY.** Supreme Court: Chief Justice, Louis W. Myers; Associate Justices, William F. Lawler, Thomas J. Lennon, William H. Waste, Emmet Seawell, John E. Richards, John W. Shenk.

**CALIFORNIA, UNIVERSITY OF.** A coeducational institution of the higher learning at Berkeley, Cal.; founded in 1868. The enrollment of full-time resident students in curricula leading to degrees was 16,568 on Nov. 1, 1925. Of this number 8451 were women. The summer school registration for 1925 was 11,219, excluding duplicate registrations in more than one summer session. The number of students in the Extension Division on Nov. 1, 1925, was 35,302. The number of members of the faculty at the beginning of the fall term was approximately 1500. The endowment funds of the institution on June 30, 1925, were \$9,979,102.11 and the income on endowment funds for the year was as follows: for current use, \$324,447.92; for additions to funds, \$56,206.42; and for payment on trust funds, \$17,758.97. The number of volumes in the library was over 500,000. President, William Wallace Campbell, Sc.D., LL.D.

**CALIFORNIA DIAMOND JUBILEE.** See CELEBRATIONS.

**CAMBODIA.** A French protectorate of Indo-China lying to the north of Cochin-China, west

of Annam, and south of Laos and Siam. Area, 67,550 square miles; population, according to the census of 1923, 2,449,771, of whom 1702 were Europeans (excluding the military forces). Pnôm-Penh, with a population of 71,586, is the capital and chief town. The soil is very fertile but only a comparatively small area is under cultivation. Rice is the chief product, its annual export being about 300,000 tons. The other products include cotton, pepper, kapok, salt fish, hides, cattle, coffee, sugar, rubber, and iron. In 1923. 9409 vessels of 480,676 tons entered and 5409 vessels of 360,285 tons cleared the ports of Cambodia. The budget for 1922 balanced at 8,767,275 piastres. Nominal king at the beginning of 1925, Sisowath (succeeded in 1904). Cambodia is one of the five component states of French Indo-China (q.v.).

**CAMEROON OR CAMEROONS.** See KAMERUN.

**CAMP FIRE GIRLS.** An organization founded in 1912 by Dr. and Mrs. Luther H. Gulick, for the general purpose of promoting good health by outdoor life and wholesome activities, encouraging economy and effecting social improvement. Its programme of activities is based on seven fundamental points: The home, health, nature, camp life, handicrafts, business and thrift, and citizenship or patriotism. It is carried out by a system of recognition awards under the seven points or crafts listed above and by special projects. The idea of the programme is to foster the girls' interest in their homes instead of taking them outside the home, and to offer fun and stimulus of the right sort to all types of girls, allowing the girl to develop her own individuality and not become part of a pattern. Camping, the organized hike, gypsy trips, etc., are regular features of the programme. About 150,000 Camp Fire Girls go camping every year. A group consists of from six to twenty girls with an older person (at least 18 years of age) as Guardian. Each member pays \$1 annual dues which goes toward the support of the National Headquarters, 31 East 17th Street, New York City. The official organ of the Camp Fire Girls, *Everygirl's Magazine*, is published monthly in New York. The *Guardian*, a bulletin containing suggestions for leaders, is sent monthly to each Camp Fire Guardian. The Camp Fire programme is especially adaptable for girls' work in schools and churches, and it is now being adopted by various denominations as the official programme for the "between-Sunday" activities of the girls. Membership in 1925 was approximately 200,000, divided into more than 10,000 groups in every state in the Union and in seventeen foreign countries. President, Mrs. Oliver Harriman; Secretary and National Executive, Lester F. Scott.

**CAMP, WALTER.** American football authority and health advocate, and author, died at New York, March 14. He was born at New Haven, Conn., Apr. 7, 1859, and graduated from Yale College in 1880 from which institution he later received the degree of A.M. During his college days he was captain of the baseball and football teams, and engaged in track athletics, swimming, and rowing. His interest and proficiency in sports led to his studying medicine and being chosen as athletic adviser and a member of the University Council. Camp more than any one else was credited for the development of modern American intercollegiate football from the Rugby game which was played when he entered college. He wrote many books upon athletic sports, training, and Auction Bridge. During the World War as chairman of the Athletic Department of the Navy Commission on Training Camp Activities he evolved a system of physical training known as the "Daily Dozen" which was widely adopted. An active business man, he was chairman of the Board of the New Haven Clock Company, and a director of Peck Brothers Company, as well as a trustee of Hopkins Grammar School.

**CAMPBELL, PRINCE LUCIAN.** American educator, president of the University of Oregon, died August 14. He was born at Newmarket, Mo., Oct. 6, 1861, and was graduated from the Christian College, Monmouth, Oregon, 1879. In 1886 he received the degree of A.B. from Harvard College. He was principal of the State Normal School at Monmouth, Oregon, from 1890 to 1902, when he was made president of the University of Oregon. In 1901 he was a member of the State Text-Book Commission, and was also a member of the Oregon State Bureau of Mines and Geology, and the Oregon State Library Commission. He was a member of the Executive Committee of the Y. M. C. A. of Oregon and Idaho; vice-president of the Oregon Social Hygiene Society; a director of the Oregon Association for the Prevention of Tuberculosis; vice-president and acting president of the National Association of State Universities, 1916-17; secretary-treasurer of the American Council on Education, 1917-18; and chairman of the Oregon State Council Defense Committee on scientific research, 1918.

**CANADA.** A dominion of the British Empire in North America, bounded on the north by the Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and Pacific Oceans, respectively. Capital, Ottawa.

**AREA AND POPULATION.** The total area is placed at 3,729,665 square miles, of which 3,603,909 is land area and 125,756 water area. It consists of nine provinces, each with its own parliament and administration, and two territories, viz., the Northwest Territory and Yukon Terri-

Province	Land Area sq. miles	Water area sq. miles	Total area sq. miles	Population, 1901	Population, 1911	Population, 1921

tory, each under a commissioner, assisted by a council. According to the census of 1921, the total population was 8,788,483 as compared with 7,206,643 in 1911. The 1921 figure includes 110,596 Indians and 3269 Eskimos.

The accompanying table from the *Statesman's Year Book* for 1925 shows the areas of the provinces, etc., with the population at recent censuses.

The principal cities with their populations in 1921 are: Montreal, 618,506; Toronto, 521,893; Winnipeg, 179,087; Vancouver, 117,217; Hamilton, 114,151; Ottawa, 107,843; Quebec, 95,193; Calgary, 63,305; London, 60,959; Edmonton, 58,821; Halifax, 58,372; St. John, N. B., 47,166; Victoria, 38,727; Windsor, 38,591. In 1923 the movement of population was as follows: Births, 244,498 (26.7 per 1000); deaths, 103,522 (11.3 per 1000); marriages, 65,665 (7.2 per 1000).

The accompanying table from the *Statesman's Year Book* for 1925 shows the number of immigrants during the four years ending Mar. 31, 1924:

	Number of immigrants arrived in the years ended March 31			
	1920-21	1921-22	1922-23	1923-24
English and Welsh	48,680	23,852	19,769	38,143
Irish	6,384	3,572	3,668	9,719
Scottish	19,248	11,596	11,071	25,057
Total British	74,262	39,020	34,508	72,919
The United States	48,059	29,345	22,007	20,521
Austrian	49	62	46	82
German	137	178	216	1,769
Norwegian and Swedish	1,144	922	1,455	5,960
French and Belgians	2,506	835	597	2,032
Italians	3,880	2,413	2,074	6,379
Jews	2,768	8,404	2,793	4,255
Russians and Finlanders	2,478	595	1,393	10,698
Other Nationalities	13,199	8,225	6,798	23,945
Total	148,477	89,999	72,887	148,560

The religious denominations in the order of their numerical importance in 1921 are: Roman Catholic, Presbyterians, Anglicans, Methodists, Baptists, Lutherans, the Greek Church, Jews, and Congregationalists. Of these, 3,383,663 were Roman Catholics, 1,408,812 Presbyterians, 1,407,959 Anglicans, and 1,158,744 Methodists. See UNITED CHURCH OF CANADA.

**EDUCATION.** The control of education in the Dominion is directly in the hands of the provinces. For the latest available statistics on education in each province, consult the articles on that province. The latest available figures for Canada as a whole are shown in the accompanying table published in the *Statesman's Year Book* for 1925:

Provinces	Year ended	Schools *	Teachers	Pupils	Expenditure Dollars
Ontario	Dec. 31, 1922 Elem. } June 30, 1923 Sec. }	7,224	18,190	671,364	41,416,816
Quebec	June 30, 1922	7,895	20,414	570,430	23,972,197
Nova Scotia	July 31, 1922	1,914	3,237	114,458	3,487,943
New Brunswick	June 30, 1923	1,332	2,298	78,753	2,674,377
Manitoba	June 30, 1923	1,982	3,986	142,869	12,999,254
British Columbia	June 30, 1923	1,044	3,118	94,888	7,630,010
P. E. Island	June 30, 1923	471	618	17,742	504,550
Alberta	June 30, 1923	2,995	5,669	148,045	12,358,371
Saskatchewan	June 30, 1923	5,900	7,225	193,616	14,821,744
Total		30,757	64,700	2,031,665	119,865,262

\* Where possible the number of school-houses is given, and elsewhere the number of school districts with schools in operation.

Higher education in Canada is carried on in 23 universities and 65 classical colleges, including 21 classical colleges in Quebec. Of the universities six were state-controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia); four others were under denominational (Dalhousie, McGill, Queen's, and Western); while the remainder were undenominational. The 23 universities had 3532 professors and 39,226 students in 1922-23. The universities supported by private funds are McGill, Dalhousie, Queen's, and Western and the University of London, Ontario. There are also the higher denominational universities of King's, Acadia, and St. Francis Xavier in Nova Scotia, Mt. Allison in New Brunswick; Laval and Bishop's College in Quebec; and McMaster and Ottawa in Ontario.

**AGRICULTURE.** The accompanying table from the *Statesman's Year Book* for 1925 shows the estimated agricultural wealth and production for 1923:

	Values in dollars
Land	3,816,061,000
Buildings	1,382,684,000
Implements and machinery	665,172,000
Livestock	613,260,000
Poultry	39,840,000
Animals on fur farms	5,864,000
Total	6,022,881,000
	Production in dollars
Field crops	899,166,000
Farm animals	82,402,000
Dairy products	226,356,000
Poultry and eggs	58,647,000
Fruits and vegetables	58,216,000
Miscellaneous	17,345,000
Total	1,342,132,000

The acreage and yield of the principal crops in 1924 were as follows: Wheat, 22,504,658 acres, 271,622,000 bushels; oats, 14,480,568 acres, 420,500,000 bushels; barley, 3,407,514 acres, 84,095,000 bushels; rye, 890,652 acres, 14,500,000 bushels; flax, 1,275,314 acres, 9,751,000 bushels; mixed grains, 848,318 acres, 30,359,000 bushels; other grains, 989,000 acres, 25,681,000 bushels; potatoes, 563,899 acres, 58,069,000 cwt.; roots, 198,585 acres, 39,967,000 cwt.; hay and clover, 9,784,413 acres, 14,591,800 tons; alfalfa, 474,204 acres, 1,055,000 tons; fodder-corn, 718,535 acres, 5,363,500 tons. See table for production by countries under article, AGRICULTURE; also AGRICULTURAL EXTENSION WORK.

The number of livestock in 1923 was as follows: Horses, 3,530,641; milch cows, 3,659,365; other cattle, 5,586,866; sheep, 2,753,860; swine, 4,405,316; poultry, 45,469,292. In the same year

there were 1208 creameries, 1419 cheese factories, 366 combined butter and cheese factories, and 25 condensed milk factories. The total value of all the products of the dairy factories was \$120,164,157. Fruit farming is of considerable importance, the chief product being apples, although peaches, pears, plums, and cherries are grown in abundance. The apple crop in 1924 totaled 3,226,000 barrels as compared with 4,494,000 barrels in 1923. The 1924 wool clip was estimated at 15,111,000 pounds valued at \$3,778,000. In the same year 23,932 acres were under tobacco (chiefly in Ontario and Quebec). The production was 21,297,000 pounds valued at \$3,518,500. In 1924 the forest products (wood and wood products, unmanufactured) amounted to \$126,946,062. In 1923-24 the value of the manufactured pulp and paper exports was \$145,509,795, more than 80 per cent of which was sent to the United States. See PAPER.

**MINERAL PRODUCTION.** The accompanying table from the *Statesman's Year Book* for 1925 shows the principal metals and minerals produced in 1923 and 1924 with their values:

Product	1923		1924	
	Quantity	Value <sup>a</sup> Dollars	Quantity	Value <sup>a</sup> Dollars
<b>Metallics:</b>				
Gold .....	1,223,341	25,495,421	1,525,000	81,522,000
Silver .....	18,601,744	12,067,509	20,383,500	13,644,000
Nickel .....	62,453,843	18,332,077	69,250,000	18,697,500
Copper .....	86,881,537	12,529,186	101,565,000	13,204,000
Lead .....	111,284,466	7,985,522	168,713,500	13,497,000
Zinc .....	60,416,240	3,991,701	90,000,000	5,670,000
Other Metals .....		3,989,802		2,067,500
<b>Total .....</b>		<b>84,391,218</b>		<b>98,302,000</b>
<b>Fuels and other non-metallics:</b>				
Coal .....	16,990,571	72,058,986	13,100,000	54,280,000
Asbestos .....	231,482	7,522,506	220,000	7,200,000
Natural gas .....	15,960,583	5,884,618	16,000,000	5,950,000
Gypsum .....	578,301	2,243,100	615,000	2,450,000
Salt .....	202,397	1,718,516	215,000	1,600,000
Other non-metallics .....		2,514,006		2,350,000
<b>Total .....</b>		<b>91,936,732</b>		<b>78,830,000</b>
<b>Structural materials and clay products:</b>				
Cement .....	7,543,589	15,064,661	7,250,000	13,400,000
Lime .....	10,035,319	3,266,608		2,780,000
Brick, tile, stone, sand and gravel .....		19,420,112		17,150,000
<b>Total .....</b>		<b>37,751,381</b>		<b>33,330,000</b>
<b>Grand total .....</b>		<b>214,079,331</b>		<b>210,462,000</b>

<sup>a</sup> The metals copper, lead, nickel, and silver, are, for statistical and comparative purposes, valued at the final average value of the refined metal. Pig-iron is valued at the furnace. Non-metallic products are valued at the mine or point of shipment, and structural material and clay products at the point of shipment.

In 1925 Canada made many new production records according to the preliminary figures of the Interior Department. The copper output amounted to 112,526,000 pounds in 1925, against 104,457,447 in 1924; zinc, in 1925, 111,010,000

pounds and in 1924, 98,909,077 pounds; nickel, 73,150,000 pounds in 1925 and 67,536,350 pounds in 1924; lead, in 1925, 253,964,000 pounds, while in 1924 it was 175,484,099; asbestos, 260,000 tons in 1925, compared with 225,744 tons in 1924. Ontario's output of gold in 1925 was \$30,000,000, against \$25,675,000 in 1924, and of silver, 10,555,000 ounces, against 9,922,335 ounces in 1924. The total value of Canada's mineral production in 1925 was estimated at \$228,440,000, compared with \$209,585,406 in 1924.

**FISHERIES.** In 1923 the total value of the fisheries of Canada was \$42,565,545. The principal kinds of fish marketed were: Salmon, \$12,534,585; halibut, \$6,596,452; lobsters, \$6,365,362; codfish, \$4,079,397; herrings, \$2,659,804; haddock, \$1,046,808; sardines, \$1,016,810; whitefish, \$1,629,143. In 1923-24 the exports were valued at \$30,547,375. The number of persons employed in 1923, including those in shore work and canneries, was 68,964. In 1923 the number of canneries in operation was 938.

**MANUFACTURES.** The accompanying table from the *Statesman's Year Book* for 1925 shows the

number of establishments, the capital, the number of employees, and the amount of their salaries and wages, the cost of materials, and the value of products in 1922, in various groups of industries:

Group of industries	Number of establishments	Capital Dollars	Employees		Cost of materials Dollars	Gross value of products Dollars
			Number	Salaries and wages Dollars		
Vegetable products .....	4,355	371,361,682	63,217	64,424,922	330,589,052	527,535,801
Animal products .....	5,118	201,829,414	49,595	49,988,679	264,078,681	371,552,013
Textiles and Textile products .....	1,709	268,065,238	88,048	76,224,861	153,066,593	308,560,103
Wood and paper .....	6,983	761,188,396	118,463	132,084,915	206,682,320	489,814,782
Iron and its products .....	1,040	526,109,953	74,588	90,605,157	163,282,265	331,584,903
Non-ferrous metals and products .....	825	102,208,275	18,222	21,451,629	30,861,895	70,855,698
Non-metallic mineral products .....	781	161,063,081	14,588	18,724,780	63,377,262	109,687,454

<b>Totals .....</b>	<b>22,184</b>	<b>3,125,772,761</b>	<b>462,573</b>	<b>497,118,554</b>	<b>1,280,527,079</b>	<b>2,439,848,766</b>

COMMERCE. The trade by principal countries for the year ending Mar. 31, 1923, and Mar. 31, 1924, according to the *Statesman's Year Book of 1925*, were as follows:

Exports.* Domestic and Foreign, to	1922-23 1,000 Dols.	1923-24 1,000 Dols.
United Kingdom .....	379,919	361,197
United States .....	380,848	441,651
Japan .....	14,668	27,033
France .....	14,175	18,934
Belgium .....	12,594	17,473
Italy .....	12,190	18,508
Netherlands .....	10,728	9,535
Germany .....	10,063	16,295
British West Indies .....	9,673	11,063
Newfoundland .....	8,756	10,976
New Zealand .....	8,294	12,744
Greece .....	6,706	6,095
British South Africa .....	103	8,020
Cuba .....	5,095	6,781
Argentine Republic .....	4,445	7,308
Mexico .....	3,805	3,512
British East Indies .....	2,876	4,851
British Guiana .....	2,108	2,570
Russia .....	1,318	125
Imports* entered for consumption, from	1922-23 1,000 Dols.	1923-24 1,000 Dols.
United Kingdom .....	141,330	153,613
United States .....	540,990	601,295
British West Indies .....	12,424	13,819
British East Indies .....	12,425	14,375
France .....	12,265	15,770
Cuba .....	11,210	10,781
Switzerland .....	7,727	8,421
Japan .....	7,211	6,293
San Domingo .....	5,957	8,800
British Guiana .....	5,689	6,222
Belgium .....	4,995	5,341
Netherlands .....	4,971	5,360
Peru .....	4,712	4,039
Mexico .....	3,851	2,647
Argentine Republic .....	3,076	4,174
Germany .....	2,568	5,380
New Zealand .....	1,963	2,180
Hong Kong .....	1,880	1,971
Newfoundland .....	1,399	1,475

\* Excluding coin and bullion.

The following account of Canada's trade for the year ending June 30, 1925, was supplied by the United States Bureau of Foreign and Domestic Commerce: Canada's foreign trade for the year ending June 30, 1925, had a net favorable balance considerably better than for the 1924 fiscal year, attributable to enlarged domestic exports and lessened imports. Exports increased to \$1,078,546 from \$1,062,244,000, and reexports declined slightly to \$12,160,000 from \$13,062,000, while imports dropped to \$808,896,000 from \$854,915,000, leaving a net favorable balance in 1925 of \$281,810,000 as against one of \$220,391,000 in 1924. The trade of Canada has followed well-established lines of exporting raw materials and foodstuffs and importing manufactured and semi-manufactured products. Among these large groups in the import trade only two showed increases over 1924—textiles and chemical products. The most important group, agricultural and vegetable products, decreased slightly to \$175,929,000; but this decrease was wiped out by an increase in fibres and textile goods to a total of \$169,175,000. The second group of importance, iron and its products, showed a considerable decrease to \$139,525,000, and nonmetallic minerals a decrease to \$129,653,000. The other groups such as animal products, wood and paper, and nonferrous metals, showed slight decreases; the miscellaneous group remained about the same.

The export trade was more nearly balanced in

results, five groups showing decreases and four, increases. The principal group, agricultural and vegetable products, dropped to \$436,823,000, and wood and paper to \$257,415,000. Animal products, on the other hand, showed a large increase, reaching \$169,506,000; fibres, textile goods and chemical products increased slightly. Nonferrous metals also increased to \$94,559,000; but iron and its products, nonmetallic minerals, and the miscellaneous group had a lower value than in the preceding year.

Of 26 principal articles of import, only 11 showed increases over the previous year and most of these were small, whereas a number of the decreases were of more considerable proportions. The largest drop occurred in imports of coal, the value receding to \$62,397,000; in iron and iron manufactures, to \$139,525,000; and in sugar to \$39,754,000. Other imports showing smaller decreases were cotton, down to a total of \$60,403,000; electrical apparatus, to \$13,446,000; silk, to \$21,017,000; beverages, to \$19,565,000; tea, to \$12,207,000, and to smaller values in the case of tobacco, unmanufactured wood, paper, glass, copper, clay products, and furs. Commodities showing increases in imports were petroleum, up to a total value of \$35,911,000; wool, to \$47,251,000; fruit, to \$26,922,000; chemical products, to \$25,577,000; rubber, to \$16,558,000; grain products, to \$15,473,000; flax, hemp, and jute, to \$14,115,000; books and printed matter, to \$11,823,000; and to smaller values in the cases of hides and skins, wood and manufactured wood, and vegetables. In the same manner exports of specific commodities show considerable variation, with only five of the leading 24 articles showing decreases.

The principal commodity in the export trade of Canada is grain, and were the quantities given the decreases would be more apparent; but the price of grain was at a high level and in many cases smaller quantities brought nearly as much as the larger quantities of the year before. Wheat, by far the most important item, showed exports totaling 149,966,000 bushels as compared with 288,955,000 bushels the preceding year, while the values were \$226,047,000 and \$292,000,000, respectively. The next item of importance, unmanufactured wood (including pulp wood and timber), had a total export value of \$110,769,000 as compared with \$120,757,000 for the preceding year. Exports of manufactured wood, which include chemical and mechanical pulp, showed slight decreases and a total of \$44,655,000. The other two commodities showing decreases were furs, with a total export value of \$17,303,000, and vehicles, with a value of \$32,413,000. Articles showing increases included paper, with an export value amounting to \$100,995,000; wheat flour, to \$70,017,000; butter and cheese, to \$34,668,000; fish, to \$33,164,000; meats, to \$31,330,000; gold, to \$30,323,000; barley, to \$22,590,000; oats, to \$20,925,000; beverages, to \$17,077,000; chemical products, to \$16,788,000; seeds, to \$15,168,000; sugar, to \$13,801,000; copper, to \$13,251,000; cattle, to \$13,198,000; and farm implements, lead, nickel, silver ore, and rubber, to values of lesser amounts.

One of the outstanding features of the year's record is the fact that its Empire trade is what gives to Canada its favorable balance; the commerce with all other countries shows an unfavorable balance. Imports from the Empire during the year were valued at \$197,278,000, and ex-

ports at \$470,787,000, each representing an increase over the previous year; but imports from other countries were valued at \$611,618,000 and exports at \$607,759,000, representing a decrease of \$53,000,000 in imports and a slight increase in exports. In the Empire trade Great Britain is the dominating factor, furnishing 78 per cent of the imports and taking 83 per cent of the exports. Total imports from Great Britain amounted to \$153,457,000 and exports to \$393,741,000. British West Indies and British East Indies furnished more imports than they took exports, but New Zealand, Newfoundland, Australia, and South Africa took far more of the exports than they furnished of the imports.

In the trade with foreign countries the United States predominates, furnishing 84 per cent of the imports and receiving 71 per cent of the exports. Germany, Japan, Netherlands, Russia, Belgium, Argentina, and Italy received far more of the exports than they furnished of the imports; France held the opposite position; and the Cuban share was practically at a balance. A phenomenal feature of the trade was the enormous increase in exports to Russia, which reached \$14,496,000 as compared with \$61,319 in the previous year. Imports from Russia declined from \$344,300 to \$2800.

Canada's imports from the United States were valued at \$517,680,000 as compared with \$570,868,000 for the preceding year, and exports to the United States at \$429,276,000 as against \$423,885,000 for the preceding year. Imports from the United States were made up largely of manufactured articles, with a few raw materials. The largest single import item was coal, totaling \$58,842,000, as against \$76,652,000 in the preceding year. Raw cotton and cotton manufactures accounted for \$38,964,000, a slight decrease. Next in rank was petroleum, with an import value of \$31,861,000, and showing a slight increase; then came vehicles, with a value of \$28,577,000, or about the same as the preceding year. Imports of rolling-mill products, valued at \$24,938,000, represented a considerable decrease from the previous year. Import values remained about the same for fruits, at \$24,138,000; for machinery, at \$22,494,000; for chemical products, at \$16,926,000; for electrical apparatus, at \$11,750,000; and for books and printed matter, at \$9,395,000. Imports of wood and wood manufactures, valued at \$13,764,000, decreased from the preceding year, while rubber increased to \$13,251,000.

Exports to the United States, on the other hand, consisted largely of raw materials, with certain manufactured products. The leading item in this trade was paper, valued at \$92,374,000, a slight increase over the preceding year's value. Exports of unmanufactured wood, including pulp wood, totaled \$91,403,000, and represented a small decrease. Manufactured wood, including wood pulp, was about the same as in the preceding year, with a value of \$38,501,000. Shipments of gold ore and dust, totaling \$30,251,000, showed a large increase. Seeds increased to a total of \$14,383,000, but grain and grain products were more than cut in half, and totaled only \$12,307,000. Fish exports remained about the same at \$13,445,000, as did exports of furs, at \$11,089,000; but beverages, at \$12,908,000, showed some increase. Slight advances occurred in exports of chemical products, at a value of

\$8,142,000; milk, at \$8,071,000; and silver ore and bullion, at \$7,123,000.

**FINANCE.** On May 31, 1924, the net debt of Canada was \$2,385,263,513. The total revenue for the fiscal year 1923-24 was \$388,514,567 and the total expenditure, \$314,327,555. For the details of the 1923-24 budget see preceding **YEAR BOOK**. The estimates for expenditures for the 1924-25 fiscal year totaled \$40,571,850. The chief items were: Services on public debt, \$134,258,272; railways and canals, chargeable to income, \$58,116,929; pensions, \$34,122,078; subsidies to provinces, \$12,375,153; post office, \$29,586,119; soldiers' civil reestablishment, \$9,550,000.

**SHIPPING.** The sea-going and coasting vessels that entered and cleared Canadian ports during 1923 is shown in the accompanying table from the *Statesman's Year Book* for 1925:

Vessels	Entered		Cleared	
	No.	Tons	No.	Tons
Sea-going:				
Canadian ...	8,199	3,576,451	8,494	3,887,858
British .....	2,473	7,237,733	2,396	6,631,172
Foreign ....	8,790	6,281,699	8,703	6,668,924
Total ...	19,462	17,095,883	19,593	17,182,454
Coasting:				
British and Canadian ...	81,045	34,899,863	78,519	33,520,831
Foreign ....	1,515	1,840,178	1,514	1,209,206
Total ...	82,560	36,240,041	80,033	34,730,037

In the same year the vessels entered and cleared at Canadian ports on inland waters between Canada and the United States were: Canadian, 42,671 of 18,959,478 tons; United States, 69,706, of 19,165,368 tons. The inland waterway system in Canada by lakes, rivers, and canals has a length of over 2700 miles. Down to 1923, \$202,165,745 had been spent on canals for construction and enlargement alone. In 1923, 30,451 vessels of 16,343,779 tons passed through the Canadian canals.

**RAILWAYS.** On Dec. 31, 1923, the total single track mileage of steam railways in Canada was 40,094. The total mileage, including second track, yard track, and sidings was 52,365.

In 1925 the total new line mileage of railways constructed in Canada was 414, as compared with 615 in 1924 and 655 in 1923. Of the new track constructed in 1925, 312 miles were built by the Canadian National and 75 miles by the Canadian Pacific. The added mileage on both systems for the most part involved the completion of work on branch lines. Comparatively little second track work was done in Canada during 1925 as had been the case in most years since the outbreak of the war, and but 3.67 miles of new second track construction was reported. During the year 63 miles were abandoned, as compared with 52 miles in 1924. Of this, 10.3 miles of track were taken up, while 53 miles were abandoned. This included the line of the Maine Central from Beecher Falls, Vt., to Lime Ridge, Quebec, a distance of 53.06 miles.

**GOVERNMENT.** Executive power is exercised in the King's name by the governor-general of Canada, acting through a responsible ministry or cabinet. Legislative power is in a parliament of two houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members, under the representation bill of 1923, elected by popular

vote including woman suffrage. Women are eligible for election to parliament. Governor-general at the beginning of 1925, Lord Byng of Vimy, appointed Aug. 2, 1921. The ministry at the beginning of the year was constituted as follows: Prime Minister, Secretary of State for External Affairs, President of the Privy Council, William Lyon Mackenzie King; Finance, William Stevens Fielding; National Defense, Edward M. Macdonald; Immigration and Colonization, James A. Robb; Postmaster-general, Charles Murphy; Public Health, Henri S. Béland; Justice, Ernest Lapointe; Customs, Jacques Bureau; Marine and Fisheries, Arthur Cardin; Solicitor-general, E. J. McMurtry; Trade and Commerce, Thomas A. Low; Secretary of State, Arthur B. Copp; Railways and Canals, George P. Graham; Mines, Charles Stewart; Agriculture, William R. Motherwell; Labor, James Murdoch; Public Works, James H. King; Ministers without Portfolio, Raoul Dandurand and John E. Sinclair.

### HISTORY

**PARLIAMENT.** On February 4 the fourth session of parliament opened with a speech from the throne by Gov.-Gen. Lord Byng. He stated that the chief legislative programme of the government would include the following: equalization of railway rates; reduction of ocean freight rates; improvement of all Canadian ports engaged in ocean commerce; securing of greater coöperation with the United States in suppressing the liquor and narcotic trades; to call a conference between the federal and state governments to consider the advisability of amending the constitution and changing or abolishing the powers of the senate; and to make attractive offers to desirable immigrants to settle the unoccupied lands of the Dominion. On February 19 it was announced that the government had agreed to subsidize private shipping interests to carry on trade between Canadian and other ports of the British Empire at agreed rates. The chief purposes of this, according to Prime Minister McKenzie King, was to reduce the freight rates and break the monopolistic control over Canadian shipping exercised by the North Atlantic Steamship Conference.

**TREATIES WITH THE UNITED STATES.** On February 5 the government filed with the League of Nations the "Halibut Treaty" which was concluded with the United States in 1923 and which regulated the fisheries in the Northern Pacific. An interesting feature of this treaty was the fact that it was negotiated directly by the Canadian government and the United States government and not through the medium of the British Ambassador at Washington. Consequently it was filed with the League by Canada and not by Great Britain. The House of Commons of Canada approved two other treaties with the United States on March 3. The first provided for more stringent rules and regulations against the illicit trade in narcotics across the borders and the other enlarged the list of crimes which were extraditable from one country to the other.

**THE PROVINCES.** The government of Ontario introduced a measure in the provincial legislature to amend the prohibition act so as to permit the manufacture and sale of 4.4 per cent beer, saying that it was acting merely in accordance with the wishes of a large majority of the people. The prohibition leaders of course at-

tacked the measure as a direct assault on temperance itself. The bill was finally passed and measures were taken by the hotels, etc., to provide for a great rush of Americans from across the border. The press reported that both the Canadians and Americans were sadly disappointed in the quality and flavor of the new brew. On April 16 the Liquor Control Act went into effect in Saskatchewan. The provisions of this measure were unique. In city stores the amount of intoxicants which could be sold to any individual in one day was 4 gallons of beer, 2 gallons of wine, and 1 quart of spirits; in the country stores the amount was limited to 4 gallons of beer. During the same month the provincial legislature of Quebec adopted by a large majority a resolution expressing opposition to the abolition of the Canadian Senate or the Legislative Council. On April 2 the press reported that the negotiations concerning the settlement of the boundary of Labrador between Quebec and Canada on the one hand and Newfoundland on the other had failed, largely because the price fixed by the Newfoundland government was beyond the means of Quebec.

**ELECTIONS.** Undoubtedly the outstanding feature of Canadian history in the period under review was the national elections held on October 29. Premier King announced on September 5 that the present parliament would be dissolved and that he and his party would appeal to the people for a larger majority to carry out its programme. In the elections of 1921 Premier King's party (Liberal) had received a bare majority of one vote over the opposition. The Liberals had managed to get along for four years with the aid of the Progressive party although the former were unwilling to accept the latter's programme. In the election of 1925 the outstanding leader of the Liberals was Premier King himself. The platform of this party called for an adequate but moderate tariff, the reform of the Senate, a strong immigrant policy, government steps to develop the foreign trade of the Dominion, the completion of the Hudson Bay Railroad and the reduction of grain rates. The chief opponent of the Liberal party was the Conservative group under the able leadership of Arthur Meighan. About the only plank in the Conservative platform was that providing for a higher tariff. This was claimed to be a cure for all the ills of the country. The Progressive party platform called for the initiative, referendum, and recall, old age pensions, the abolition or reform of the Senate, a low tariff, proportional representation, and the nationalization of the railways. The Labor party which was not particularly strong included in its platform the public ownership of all means of production, the eight-hour day, Oriental exclusion, a non-partisan tariff commission and international disarmament.

The number of seats contested was raised from 235 to 245 on account of federal redistribution. As events later turned out this increase in the number of constituencies worked in favor of the Liberals and Progressives. The results of the election caused a greater confusion than existed before. As a result of the 1921 elections the House was composed as follows: Liberals, 117; Conservatives, 49; Progressives, 61; Labor, 2; Independent, 2; Vacant, 4. After the new elections the alignment was as follows: Liberals, 101; Conservatives, 118; Progressives, 23; Labor, 2; Independent, 1. It will be seen from

these figures that although the Conservatives made extremely heavy gains and the Liberals and Progressives lost, no one party had a numerical majority. Premier King and eight of his cabinet members suffered personal defeat. In the face of the returns it appeared that the Progressive group held the balance of power and could make or break either the Liberal or Conservative parties by aligning with the other group. The position of the Premier was very uncertain. He had lost his seat and no longer had a majority behind him. After a conference with Lord Byng and the Cabinet, he announced on November 5 that he had determined to hold office until the meeting of the new parliament. He said, "I am not aware of any precedent in Great Britain or in Canada for recommending, before Parliament meets, that the leader of a party not commanding a clear majority in the House of Commons should be called upon to form a government." Arthur Meighan, the Conservative leader, said in reply to this: "The Premier's statement, stripped of sophistry, is merely an announcement of his determination to 'hang on' in defiance of a heavily adverse verdict from the people of Canada. Mr. King declared as the reason for his appeal to the people that his government could not satisfactorily conduct public business while dependent upon Progressive support. In defiance of this declaration, he now decides to cling to office, although dependent more than before upon Progressive support." Premier King announced on November 30 that the new parliament would meet on Jan. 7, 1926, and that he would only make the most necessary appointments and transact only the most necessary business while waiting for the new legislature to assemble. See MUNICIPAL GOVERNMENT: ROADS AND PAVEMENTS.

**CANALS. WELLAND SHIP CANAL.** During the year active progress was made on the fourth canal between Lake Erie and Lake Ontario, which had been started in 1913 but on which construction work was postponed by the war. The new canal was to replace the existing canal, which had 26 locks 270 x 45 feet with 14-foot draft, and a length of 46½ feet and a single lock 1380 x 80 feet with a length ranging from zero to 11 feet, depending upon the water level of Lake Erie at Port Colborne. In the autumn of 1925 the Canadian Government awarded the contract for the last section No. 6 from Welland to Port Robinson, the amount being slightly in excess of \$7,000,000. This work was to be commenced during the winter, 1925-26. At the end of the year work on five locks was nearing completion and contracts for the entire work had been let. The progress of the work was stated as follows: Of a total of 8,674,000 cu. yds. of rock excavation, 43 per cent was finished; of 46,839,000 cu. yds. of earth excavation, 48 per cent; of 3,462,000 cu. yds. of watertight embankments, 70 per cent; and of 3,381,000 cu. yds. of concrete, 52 per cent. The new harbor on Lake Ontario was practically completed and it was believed that the canal would be finished in time for the opening of navigation in 1930.

**CHESAPEAKE AND DELAWARE CANAL.** The U. S. Government in 1925 was actually engaged in the enlargement of the old waterway known as the Chesapeake & Delaware Canal, first opened for traffic July 4, 1829, to connect Chesapeake and Delaware bays. Where the canal is built the two major bays are only about 14 miles

apart and the existing waterway comprised a short tidal entrance channel at the Delaware end, a 4.3 mile slack water section with a level about 7½ feet above mean low water from Delaware City to St. Georges, a slack water section of 9.3 miles long from St. Georges to Chesapeake City with a level of 17½ feet above mean low water and a tidal section of 4.2 miles from Chesapeake City to the bay in Back Creek and Elk River, affording 13.6 miles of slack water and 4.3 miles of tidal canal navigation. There was a channel generally navigable for a full length of 17.9 miles for craft drawing 9 feet. The U. S. Government purchased from the owners, the Chesapeake & Delaware Canal Company, the entire property in 1919 for \$2,514,290 and its enlargement was provided for by Act of Congress. This involved a dredging operation for the removal of about 16,000,000 cu. yds. so as to change the old boat canal with locks to a sea level canal with 12 foot depth of water and a bottom width of 90 feet. In addition to the excavation and removal of locks, there were required five major bridge crossings and the construction of jetties and dykes, the work having to be done without stopping the canal traffic or the crossings of roads and railways. The canal traffic was of considerable volume, amounting in 1924 to 683,206 tons of freight. The enlargement of the waterway involved following the old route, except for about a mile at the Eastern end, but making it into a sea level canal 12 feet deep at mean low water and 90 feet wide, with an approach at the Delaware end 150 feet wide, and the same width at Back Creek on the Chesapeake side. On the Chesapeake end there was to be built a branch channel 12 feet deep and 36 feet wide in addition to the new channel. In addition to the canal proper, at the Delaware end jetties were under construction consisting of rubble mounds on fascine mattresses 650 feet apart at the shore ends and 800 feet apart at the sea ends and 1460 feet and 1320 feet long respectively. The dredging work was being done with hydraulic dredges with revolving cutter heads and the work was done without interfering with traffic. The work was approaching completion at the end of 1925.

**ILLINOIS WATERWAY.** The State of Illinois had under construction during the year a connecting link of 63 miles from the Chicago Drainage Canal at Lockport, to the Illinois River at Starved Rock. This would make possible navigation by the Great Lakes and Mississippi River for barges and would provide for a future 14-foot waterway. The status of the work, completion of which was expected by 1930, at the end of the year was as follows: Marseilles lock, completed; Lockport lock, 65 per cent complete; Starved Rock lock, specifications prepared for letting contract early in 1926. At the end of the year there were two locks in the Marseilles diversion canal yet to be contracted for.

**CHICAGO DRAINAGE CANAL.** During the year the Sanitary District of Chicago was actively engaged in increasing facilities under the terms of a five-year permit for the diversion of 8500 second feet of Lake Michigan water to the Illinois Valley. The entire programme for sewage treatment involved an outlay of \$120,000,000, of which \$30,000,000 had been spent and a budget of \$42,253,953 for 1926 was provided. Of this, it was stated that \$20,000,000 would probably go into new work. On the north side,

somewhat less than half completed, was the activated-sludge treatment plant, the largest yet to be built, which was designed for 800,000 people and would be completed probably in 1928. The plans had been prepared for the west side plant for 1,850,000 people, at an estimated cost of \$13,800,000. All of this work, however, was in a large measure dependent on the question of permanent diversion of Lake Michigan water, which would have to be settled by Congress.

**CANALS AT SAULT STE. MARIE.** In 1925 there was an increase in the traffic through the canals at Sault Ste. Marie, Michigan and Ontario. In 1925, 20,650 vessels passed through the canals as compared with 17,866 in 1924, or an increase of 16 per cent. The total number of lockages in 1925 was 14,688 as compared with 13,129 in the previous year, or an increase of 12 per cent. The registered tonnage in 1925 was 69,239,520 as compared with 57,290,232 in 1924, or an increase of 21 per cent, and freight amounted to 81,875,108 short tons, as compared with 72,037,390 in 1924, or an increase of 14 per cent. Passengers to the number of 56,956 passed through the canals as compared with 53,776 in 1924, or an increase of 6 per cent. The most notable increase in freight was in iron ore which amounted to 53,874,364 tons in 1925, as compared with 42,492,197 in 1924, or an increase of 27 per cent, and manufactured and pig iron, which increased from 109,663 in 1924 to 147,452 in 1925. Likewise the oil carried amounted to 222,575 in 1925, as compared with 172,782 in 1924, or an increase of 29 per cent. There was a decrease in the lumber and flour as well as hard coal passed through the canals, the last named item declining from 1,439,701 in 1924 to 899,989 in 1925, or a decrease of 37 per cent. The United States canal, which operated on April 10 and closed Dec. 16, 1925, with a season of 251 days, carried by far the greater amount of freight in 1925, the total amounting to 80,236,729, as compared with 1,638,379 of the Canadian Canal. Of the total freight passed through the canals, 67,304,774 was east bound and 14,570,334 was west bound. 17,117 vessels passed through the United States Canal with a registered tonnage of 63,550,140, and 3533 vessels with a registered tonnage of 5,689,380 passed through the Canadian Canal. See PANAMA CANAL; SUEZ CANAL.

**CANARY ISLANDS.** A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2807 square miles; population, estimated, Jan. 1, 1924, 447,755. Santa Cruz de Tenerife, with a population of 78,158 (Jan. 1, 1924), is the capital. The next largest city is Las Palmas, with a population of 67,122 in 1920. The University of Seville maintains an educational establishment in the Canaries and is in charge of higher education. There is a regular steamship communication with Spain, and a wireless station. The islands are under the administration of continental Spain through a local governor.

**CANCER.** *The Journal of the American Medical Association* for October 17 publishes an article by Scherechewsky of the U. S. Public Health Service which proves beyond a doubt that the increase in cancer in the United States is real and not merely apparent. Not more than 30 per cent of the apparent increase can be set down to better diagnosis and better vital statistics. The death rate is now 25 to 30 per cent higher than it was 21 years ago, so that the

disease is increasing over 1 per cent per annum. This figure might be still higher were it not for the fact that during this period there has been an extensive immigration of Italic and Southern Slavic stocks which suffer much less from cancer than the more northern and western European and the native American peoples. In the discussion of the paper Hoffmann of the Prudential Insurance Company stated that the author had borne out his own views so often made public. Smithies gave the causes of increase as overstrain of all tissues by excess in eating, traveling, etc., causing them to age more rapidly; while at the same time man is more exposed to variety of irritation from his manifold activities—the two main factors being senescence of tissue and irritation of the same. The reader expressed the opinion that increase of cancer had nearly reached the saturation point and would soon come to an equilibrium. A very recent statistical study of the policy holders of the Metropolitan Life Insurance Co. extending back for many years, published by Dr. Dublin, appeared to show that increase of cancer has been very slight in U. S. wage workers.

The revolutionary work of Dr. Gye and Mr. Barnard on the discovery of a cancer parasite, so widely noticed by the lay press, was rather a forward movement in microscopic technics than the herald of a specific cure of cancer. Its promise was just as great for the discovery of the causation of disease in general as of cancer. The discovery of Barnard lay in the domain of optics and of increased visibility in ultramicroscopy. Ultra-visible parasites have certainly been discovered, not only in association with cancer but likewise in an entire group of acute infectious diseases, including small pox. The organisms in question can be isolated and cultured after a fashion. They may prove to have merely a diagnostic value or they may in addition be made the basis of new forms of serum treatment. It is admitted in the case of the cancer organism that it cannot be made to produce disease in the absence of some unknown factor already present in the tissues which makes the patient susceptible to inoculation. As it stands now the hypothetical basis required by Dr. Gye for the justice of his beliefs is intricate, lacking the simplicity of great new discoveries. A recent summary of the Gye-Barnard research states that Gye has only succeeded, where others have failed, in cultivating fowl sarcoma virus, while Barnard in addition to his optical discoveries has revealed a new method of increase of very minute microorganisms.

More promising from the standpoint of treatment is the use of colloidal lead as recommended by Dr. Blair Bell of Liverpool, who has for many years sought a remedy to combat the huge mortality from cancer of the female breast and uterus. He claims a number of cures of desperate cases while admitting that results are quite negative in others. He quotes the interesting fact that workers in lead show an immunity to cancer and supplies proof of the ability of the metal to destroy embryonic cells such as cancer is presumably composed of. Lead in the colloidal form when injected into the veins is able to reach cancer cells anywhere in the body. The weak point in the theory appears to be that metals in colloidal subdivision and suspension do not owe their virtues to any specific quality as metals but to the physical

state of colloidal matter, irrespective of the particular metal involved. But Professor Bell does not find that other metals in colloidal form are efficacious in cancer, so that the rationale of the action of his colloidal lead is so far obscure. See *CHEMISTRY* under *Biochemistry*.

**CAPE COLONY.** See **CAPE OF GOOD HOPE PROVINCE**.

**CAPE OF GOOD HOPE PROVINCE.** One of the four original provinces of the Union of South Africa; the southernmost province of the Union. It was formerly known as Cape Colony or the Colony of the Cape of Good Hope. Area, 276,966 square miles; population at the census of 1921, 2,782,719, as compared with 2,564,965 at the census of 1911. For an analysis of the census of 1921, see the preceding **YEAR BOOK**. The chief towns with their populations in 1921 are: Capetown, provincial capital, 113,302; Kimberley, 18,288; Port Elizabeth, 25,982; East London, 20,374. The movement of population in 1923 was: Births, 57,747; deaths, 37,266; marriages, 13,889. In 1924 there were 124 local school districts. In 1922 the aided schools numbered 4552, with 137,581 European pupils, 160,085 non-European pupils, and 10,011 teachers. The trade between the province and the United Kingdom according to the provisional figures for 1924 was: Exports from United Kingdom to province £13,242,414; exports to the United Kingdom £12,490,873. The chief imports from the United Kingdom in 1923 were wearing apparel, cotton goods, and iron and steel goods; the chief exports to the United Kingdom were: Wool, diamonds, and hides.

**CAPE VERDE (vård) ISLANDS.** A group of fourteen islands off the western coast of Africa belonging to Portugal. Area, 1480 square miles; population according to the census of Dec. 31, 1922, 149,793. The chief products are: Coffee, hides, millet, and medicinal substances. A small military force is maintained on the islands. The estimated public revenue in 1922-23 was 4,215,400 escudos. This amount was equally balanced by the expenditures. The imports in 1923 were 63,206,354 escudos and the exports, 1,616,074 escudos. The government is administered by a governor whose seat is at Praia, the capital.

**CARINTHIA.** A former crownland of the Austrian Empire, but since the downfall of the Dual Monarchy, a province of the new republic of Austria. Area, 3688 square miles; population according to the census of 1923, 370,432, as compared with 396,200 at the census of 1910. Carinthia has 5.67 per cent of the entire population of the Austrian Republic. Capitol, Klagenfurt, with a population in 1923 of 27,423.

**CARNEGIE CORPORATION OF NEW YORK.** Founded by Andrew Carnegie, and chartered under the laws of the State of New York, June 9, 1911, this corporation was formed for the purpose of promoting "the advancement and diffusion of knowledge and understanding among the people of the United States." The original endowment was \$125,000,000, an amount to be somewhat increased upon the final settlement of Mr. Carnegie's estate. The income of this principal fund is applicable only within the territorial limits of the United States, but the Corporation holds also a special fund of \$10,000,000, of which the income is applicable in "Canada and the British colonies." The programme of the

Corporation is chiefly concerned with library service, the place of the arts in American life, adult education, scientific research, and educational studies. Although the Carnegie Corporation is an educational foundation, it is not an operating agency, and its activities are limited to financial coöperation with existing institutions and associations.

During the year 1924-25 the Corporation granted 67 applications. Eleven grants involving \$340,500 were made during the year in the field of library service, 24 involving \$514,500 in fine arts, six involving \$237,000 in adult education, and 12 involving \$213,500 in research and studies. Ten of the 14 grants involving \$847,145, not in the classifications just mentioned, were renewals or increases of grants made in former years. It was also decided to augment the endowment of the Carnegie Institution of Washington by \$5,000,000 through a series of payment distributed over five years. The total of grants authorized for the year was \$8,121,145.

The Corporation made two major appropriations during the year 1924-25, as a result of its preliminary inquiry into the place of the arts in American life. The first was a general grant of \$48,000 for the support for one year of a system of scholarships and fellowships in the arts, to become effective for the year 1926-27. In addition the Corporation set aside \$100,000 to be used for the purchase of teaching equipment for departments of fine arts in colleges and universities located in various parts of the United States and Canada. Four endowment grants of \$50,000 each were made during the year in support of the fine arts departments of four colleges of first rank, and the Corporation coöperated financially with a number of national organizations operating in this field.

Five grants for the development of college libraries were made during the year, as well as four grants in support of library school activities. In addition, the Corporation financed studies in library service by the American Library Association, and its Commission on the Library and Adult Education, and by the League of Library Commissions.

In connection with its general preliminary inquiry in the field of adult education, the Corporation was financing a three-year study of the learning process in terms of age levels, which is supplementary to a preliminary investigation on adult education previously undertaken. Special projects, in the form of experiments and demonstrations, financed by the Corporation, were conducted by a few adult education agencies during the year.

Other important research problems during the year that were supported by the Corporation related to such matters as the nature of water, to pyorrhea, and to the production of insulin at various centres. A grant was made for an investigation of otosclerosis. Financial participation was given in the Restatement of the Law being formulated by the American Law Institute; also in the engineering study of the Society for the Promotion of Engineering Education; in the economic studies of the Institute of Economics; in the work of the National Bureau of Economic Research; the Institute for Research in Land Economics and Public Utilities; and the Food Research Institute. Other studies included that of classical education by the American Classical League, of modern foreign lan-

guages in the United States and Canada sponsored by the American Council on Education, and that of medical education by the Association of American Medical Colleges.

The Trustees of the Carnegie Corporation were: James Bertram, Nicholas Murray Butler, Louise M. Carnegie, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, Frederick P. Keppel, Russell C. Leffingwell, John C. Merriam, John A. Poynton, Henry S. Pritchett, and Elihu Root. Officers of Administration: Elihu Root, Chairman of the Board; Robert A. Franks, Vice-Chairman and Treasurer; Frederick P. Keppel, President; James Bertram, Secretary; and Morse A. Cartwright, Assistant to the President. Headquarters were located at 522 Fifth Avenue, New York City.

**CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE.** See PEACE.

**CARNEGIE INSTITUTE.** See ART EXHIBITIONS.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A non-sectarian institution of technical education at Schenley Park, Pittsburgh, Pa.; founded in 1900. The enrollment for the fall of 1925 was 5479, including 2162 registered in the regular day courses, and 2912 in the evening courses. For the summer session 502 students were registered. The faculty numbered 282, of whom 230 were on full time, and 52 on part time. The endowment of the institution was \$15,932,750, and the annual income \$749,852.17. The institution has a campus branch of the Carnegie Library of Pittsburgh which has 450,000 volumes. President, Thomas Stockham Baker, Ph.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** An organization founded in 1902 to encourage in the broadest and most liberal manner investigation, research and discovery, and the application of knowledge to the improvement of mankind. The results of its investigations are made known through regularly established channels of publication, such as the scientific journals, through its own *Year Book*, and in a series of monographs issued by the institution. During the years 1902-1925, 527 volumes were published in this series, 18 being authorized during 1925 at an aggregate cost of \$54,700; 13 additional volumes were in press at the close of the year. The *Year Book* includes statements relating to current advance of researches and reports of progress of the following established departments of research: Department of Embryology, Department of Genetics, Geophysical Laboratory, Department of Historical Research, Department of Meridian Astronomy, Mount Wilson Observatory, Nutrition Laboratory, Laboratory for Plant Physiology, and the Department of Terrestrial Magnetism.

In addition, reports also appear in the *Year Book* concerning investigations undertaken by a number of individuals, or groups of individuals, who are working upon special projects, among which may be mentioned the ecological researches of F. E. Morley and his associates in Middle American Archaeological Research, the biological studies of T. H. Morgan and his colleagues at Columbia University, the studies in physiological chemistry of T. B. Osborne and L. B. Mendel at the Connecticut Agricultural Experiment Station, and the work of the Advisory Committee in Seismology of which Arthur L. Day is chairman.

In the President's annual report, which also

appears in the *Year Book*, mention was made of the gift of \$5,712,500 which had been authorized by the Carnegie Corporation of New York for purposes of research under the auspices of the Institution. Five million dollars of this amount was to be added to endowment in yearly increments of \$1,000,000 beginning with the Corporation year 1926-27, and continuing until the total sum is paid, the remaining \$712,500 becoming available as interest on the entire contribution. Reorganization of plans of the Department of Embryology was making possible proposals relating to development of this work which had long been under consideration. Dr. Carl G. Hartman, formerly professor of zoölogy at the University of Texas, was to study growth of the embryo in certain of the highest animals, and for this purpose a colony of macaques, or small monkeys from India, was to furnish exceptional opportunity for observation in expectation that important advances in knowledge of physiology or function of the embryo might be made with special relation to research on physical factors involved in human behavior.

During 1925 patents were granted to Dr. F. G. Benedict, Director of the Nutrition Laboratory, and Mrs. Benedict on a simplified form of respiration apparatus, and to Dr. John A. Anderson of the Mount Wilson Observatory on a seismometer for recording and measuring earth tremors. These patents have been assigned to the Institution, and arrangements for manufacture and sale of the instruments were to be made without financial profit by the Institution. The increasing value of seismological research was emphasized particularly by reason of recent earthquake disasters in California. Many agencies were co-operating with the Institution in these studies and the California Institute of Technology in Pasadena added to its equipment a special building for seismological research to be occupied by the Carnegie Institution. During the year important lectures and exhibits relative to the work of the Institution were held in the Administration Building in Washington.

An amount of \$28,864,122.94 had been received by the Institution from all sources since its foundation and the sum of \$28,542,996.33 was expended during this period. At the annual meeting of the Board of Trustees on Dec. 11, 1925, an appropriation of \$1,457,760 was authorized for purposes of research and publication in 1926 and at the same time Mr. George J. Baldwin of Savannah, Ga., and Mr. Whitefoord Cale of Nashville, Tenn., were elected to fill vacancies in the Board caused by the resignations of Mr. Charles Payne Fenner and Dr. Henry P. Walcott.

**CAROLINE ISLANDS.** See GERMAN NEW GUINEA.

**CARRIERS.** See TYPHOID FEVER.

**CARTER, HENRY ROSE.** American sanitarian, assistant surgeon-general United States Public Health Service, died September 14. He was born at Clifton Plantation, Caroline County, Va., Aug. 25, 1852, and was educated at the University of Virginia graduating as civil engineer in 1873, remaining for post-graduate work in mathematics and applied chemistry. In 1879 he took the degree of M.D. at the University of Maryland School of Medicine, and in the same year entered the United States Marine Hospital Service, later known as the United States Public Health Service, as assistant surgeon. He rose

by successive grades until by special act of Congress he became assistant surgeon-general on Mar. 4, 1915. He devoted himself especially to sanitation problems in connection with yellow fever and malaria when in 1888 he served at the Ship Island Quarantine Station on the Gulf of Mexico. He had charge in several yellow fever epidemics in Southern States. He was the discoverer of the extrinsic incubation of yellow fever which had an important bearing on later experiments demonstrating that this disease is carried by mosquitoes. In 1889 he inaugurated the quarantine system in Cuba, and from 1904 to 1909 he was director of the hospitals in the Panama Canal Zone. He made a special study of impounded waters as affecting malaria and wrote many articles in the Public Health Reports and medical journals pertaining to yellow fever, impounded water, malaria, and related topics. He was a member of the Rockefeller Yellow Fever Commission sent to Central and South America in 1916, and in 1917-18 he was in charge of the anti-malaria measures for United States Army Cantonments carried on by the United States Public Health Service. In 1920-21 he was sanitary adviser to the Peruvian Government, and was a member of the Yellow Fever Council of the International Health Board in addition to many other responsible positions. His work as a sanitarian was well known in Europe and in 1904 Maj. Sir Ronald Ross, the famous British sanitarian, presented his name for the Nobel prize.

#### CASE SCHOOL OF APPLIED SCIENCE.

An engineering school at Cleveland, Ohio; founded in 1881. The enrollment for the autumn of 1925 was 610. The faculty numbered 60. The productive funds of the institution amounted to \$3,500,000. The library contained 23,000 volumes. President, Charles Sumner Howe, Ph.D., D.Sc., LL.D.

#### CASUALTY INSURANCE. See INSURANCE.

#### CATHOLIC UNIVERSITY OF AMERICA.

A Roman Catholic institution of the higher learning at Washington, D. C.; founded in 1867. In it are included graduate schools of sciences, law, and philosophy. The institutions affiliated with it are the Catholic Sisters College for the training of teachers; Trinity College for the higher education of Catholic young women; and the houses of study of 16 religious orders. The enrollment for the fall of 1925, excluding that of the schools of theology and canon law, in the university proper was 744, while there were 2311 in the university and all its affiliated institutions. In the 1925 summer session there was a registration of 448, which did not include the summer school at San Francisco, California, conducted under the auspices of the university, and in which were enrolled approximately 300. In the fall of 1925 the number of members on the faculty totaled 112, of whom 29 had the rank of professor, two promotions having been made from the rank of associate professor to that of professor. The productive funds amounted to \$2,700,000, and the income for the year was \$656,000. In 1925 the Chemical Laboratory Auditorium was completed, and the John K. Mullen Memorial Library was under construction. Among the important gifts of the year was an additional \$130,000 from John K. Mullen, Denver, Colorado, toward the erection of the John K. Mullen Memorial Library; \$60,000 from Mar-

quis Maloney, Philadelphia, Pa., for the completion of the auditorium of the Martin Maloney Chemical Laboratory; \$42,000 from the Hierarchy of the United States for the erection of a building to serve as a home for ecclesiastical professors. The library contained 250,000 volumes. Rector, Rt. Rev. Thomas J. Shahan, S.T.D., J.U.L., LL.D., Titular Bishop of Germanicopolis.

#### CATTLE. See LIVESTOCK.

#### CATTLE TICK. See VETERINARY MEDICINE.

**CAUCASUS**, kă'ka-sūs. The name applied to the indefinite region in southeastern Europe, comprising the isthmus which separates the Sea of Azov and the Black Sea from the Caspian Sea; formerly a general government of the Russian Empire. It was divided into two districts of Trans-Caucasia and Cis-Caucasia, of which the former, at the beginning of 1919, was distributed among the three republics of Armenia, Azerbaijan, and Georgia. These afterwards separated and were respectively incorporated under the constitution of 1923, in the Union of Soviet Republics, and are now known as the Transcaucasian Federation of Soviet Republics.

#### CAVALRY. See MILITARY PROGRESS.

**CELEBRATIONS.** During 1925 celebrations in the United States were chiefly devoted to anniversaries of important events in American history, especially the sesquicentenary events connected with the War of the Revolution.

Among the more noteworthy of these were:

**APRIL 19-20. PATRIOTS' DAY, THE 150TH ANNIVERSARY OF THE LEXINGTON-CONCORD BATTLE.** Its celebrations began on the evening of April 18 with the lighting of lanterns in the Old North Church, after which services were held in commemoration of the 150th anniversary of Paul Revere's ride, with addresses by Vice-President Charles G. Dawes, Mrs. Nathaniel Thayer, great-granddaughter of Paul Revere; Dr. William H. Dewart, rector of Old North Church; and Bishop William Lawrence of the Protestant Episcopal Church. The exercises on the 19th included decorating the graves of Paul Revere and William Dawes, Jr., and the rededication of Faneuil Hall, restored to its original appearance, at which function Mayor Curley presided and General Pershing made the principal address. A bronze tablet was placed on the site of the home of William Dawes, Jr., the ancestor of Vice-President Dawes.

On the 20th a repetition of the ride of Paul Revere was enacted and the messenger dressed in colonial attire, after receiving a scroll of parchment signed by Mayor Curley and General Pershing, left North Square reviewing stand at 10 o'clock in the morning and repeated the famous ride. Along the route, stops were made at Brookline, Cambridge, and Arlington where suitable exercises were held, and finally Lexington was reached where a military parade was reviewed by General Pershing and Vice-President Dawes. At Concord addresses were made by these distinguished guests of the Commonwealth and a reproduction of the battle was given. Down a snow-covered grassy slope a little band of Minute Men and militia, clad in the Colonial buff and blue, marched to the tune of "The White Cockade," played by its fifers. On the banks of the Concord River a still smaller company of British Grenadiers stood guarding the Old North Bridge. At the approach of the Colonials the Red Coats retreated across the bridge, their fifers playing "Yankee Doodle," and

some of them began to rip up the planks with their bayonets. Shouts of defiance were followed by a British volley and two Minute Men fell. The Colonials aimed their flint locks and returned the fire. For a few moments muskets blazed on both sides. Then the British regulars turned and fled and the farmer soldiers took possession of the bridge.

A medal designed by Anthony de Francisci commemorating the Paul Revere sesquicentennial was struck by the American Numismatic Society and there was also a medal struck in commemoration of the celebration of Lexington. A series of Lexington-Concord commemorative postage stamps were issued in honor of this celebration by the Government as follows: 1 cent, green, showing Washington taking command of the army under the elm at Cambridge; 2 cent, red, showing the battle scene of Lexington and Concord; and 5 cent, blue, showing a reproduction of the statue of the Minute Men at Concord.

MAY 18. THE 150TH ANNIVERSARY OF THE SIGNING OF THE MECKLENBERG DECLARATION OF INDEPENDENCE. This event was commemorated in a celebration held in Charlotte, N. C., during the week May 18-23. The principal feature of this event was a pageant participated in by more than 800 persons that was presented each night of the week, enacting the historical background of the Mecklenberg fight for freedom from England and the signing of the declaration a year before the American declaration. An open-air amphitheatre, with a seating capacity of 8000 was built for the staging of the pageant. On the 20th, the actual anniversary day—for the Declaration was signed on May 20, 1775, on receipt of the news of the battles of Concord and Lexington—the exercises included a military parade which was reviewed by Gov. Angus W. McLean, after which addresses were made by Hon. Adam M. Wyant of Pennsylvania, member of the congressional commission for the celebration, and Miss Sara Schuyler Butler of New York, member of President Coolidge's commission. This day was designated as "Independence Day." Other days received appropriate names, as "Carolina Day," etc. Addresses by distinguished speakers were made at the meetings that were held each night during the week.

JUNE 6-9. CENTENNIAL OF THE ARRIVAL OF THE FIRST NORWEGIANS TO FOUND IN THE UNITED STATES A PERMANENT HOME. This celebration was held in St. Paul, Minn. Similar in its purpose to the sailing in 1620 of the *Mayflower* of Plymouth with its band of pilgrims in pursuit of religious freedom, early in the last century a party of 52 men and women who were Norwegian Quakers, seeking relief from the cruelties of the state church in Norway, sailed on July 4, 1825 on the *Restaurationen* from Stavanger, Norway, and arrived in New York on October 9. A large gathering of Norwegian-Americans from all parts of the United States and Canada met in St. Paul, and at this celebration President Coolidge was an honored guest. The public exercises extended over four days and the great event was a memorable speech by the President. Norway was officially represented by the Minister of Social Affairs, Lars Oftedal; the Storting's representative, C. J. Hambro, president of the University of Oslo; Prof. Frederick Stang representing the Norwegian

colleges; and there were others, representatives of institutions and organizations. Congress authorized the issuing of a commemorative medal, and two postage stamps—one a two cent stamp printed in red, had for its central design the sloop *Restaurationen* with a smaller vessel in the background, and the other a five cent stamp printed in blue, had as its central design a Viking ship—were authorized in honor of the celebration. In June the celebration of the centenary of the Norwegian Emigration to the United States was continued in Norway at the ancient fortress of Akershus, following the arrival of 800 Norwegian-Americans, when speeches were made by King Haakon, the American Minister, and the President of the Storting.

In September a similar celebration with appropriate exercises was held in Seattle, Wash., by the Norwegian settlers in the extreme northwest. During October 9, 10, and 11, a series of commemorative events were held in New York City. These began with a national Norse play at the Academy of Music in Brooklyn on October 9. On the 10th the grand opening took place in the 71st Regiment Armory, in Manhattan, where Governor Smith of New York, Governor Silzer of New Jersey, the Minister of Norway, Bryn, and the President of the Norwegian Senate, Wefring, made addresses. On the morning of the 11th services were held at the Brooklyn Academy of Music by Bishop Peterson of Norway, who came specially to the United States for the event. In the evening there was a banquet in the St. George Hotel in Brooklyn.

JUNE 17. THE 150TH ANNIVERSARY OF THE BATTLE OF BUNKER HILL. This sesquicentennial was celebrated in Boston and vicinity with an impressive succession of ceremonies. On March 11, President Coolidge appointed the Bunker Hill Sesquicentennial Commission to consist of Mrs. Helen Rogers Reid of New York, the Rev. Charles W. Lyons of Washington, and Isaac T. Mann of West Virginia. The commission was authorized by Congress to arrange for Federal participation in the celebration of the 150th anniversary of the battle of Bunker Hill.

The exercises proper began with daylight salutes at the monument and were continued by a parade with 15,000 persons in line, led by a contingent of nearly 1000 sailors and marines, which was reviewed by Mayor Curley and his official guests and associates. Of considerable interest were the exercises held in Faneuil Hall under the auspices of the Bunker Hill Association at which Charles E. Hughes of New York delivered the oration; his predecessors on similar occasions having been Daniel Webster and Edward Everett. Also at the foot of the monument patriotic exercises were held at which the chief event was the delivery of an ode to Bunker Hill by Edwin Markham. In Charlestown a historic pageant was given in which famous American events since 1600 were depicted. Minor celebrations of a patriotic nature were also held in various suburban places in the vicinity of Boston. A commemorative medal designed by Julio Kilenyi, was issued in honor of this celebration.

JULY 3. SESQUICENTENNIAL OF WASHINGTON'S TAKING COMMAND OF THE ARMY. The final sesquicentennial celebration of the early events of the Revolution that occurred in the vicinity of Boston, was that of the date when Washington took command of the Continental

Army under the historic elm. The exercises began with a religious service in Christ Church, Cambridge, at which Bishop William Lawrence delivered a historic address. Early in the afternoon a large parade, headed by President Coolidge and his party, passed over the historic ground, and was reviewed by President Coolidge, Governor Fuller, Mayor Curley, and others. Numerous floats were in the procession, representing historic features that were of pertinent interest. There followed a pageant depicting the historic event of 150 years previous in elaborate detail which passed in front of the presidential stand. Then the school children sang the sesquicentennial hymn written to the tune of the Lohengrin wedding march, and last of all President Coolidge delivered an address prepared for the occasion and in which he stressed Washington's great passion for scientific agriculture, a phase of his career hitherto somewhat ignored.

**JULY 8. THE 167TH ANNIVERSARY OF THE BATTLE OF TICONDEROGA.** This was celebrated by the St. Andrew's Society of Glens Falls, N. Y., by the unveiling of a tablet at Fort Ticonderoga in commemoration of the gallantry of the Black Watch Regiment. The tablet is erected on the spot where the French line was established in the battle between the French and the British on July 8, 1758. The inscription is: "The Saint Andrew's Society of Glens Falls, N. Y., erected this tablet to commemorate the heroic gallantry of the Forty-second Regiment of Foot, better known as the 'Royal Highlanders,' or the 'Black Watch,' who, on July 8, 1758, lost here in killed and wounded over 600 of the 1000 men engaged."

**AUGUST 17-22. CENTENNIAL OF FORT VANCOUVER.** The centenary anniversary of the settlement of the fur-trading post of Fort Vancouver, at Vancouver, Wash., on the Columbia River was celebrated August 17-22. This settlement was made by a band of venturesome *voyageurs* of the British Hudson's Bay Company, chief among whom was Dr. John McLoughlin who was not only the builder, founder, and first chief factor of Fort Vancouver but also commandant at this historic frontier fort for 20 years, being during that time the real ruler of the vast territory of Oregon and Washington. In addition to the usual military and literary exercises, a special pageant entitled: The "Coming of the White Man," written by Dwight A. Parrish, was an important feature of the event. A commemorative silver half dollar was coined by the U. S. Government in honor of the celebration.

**SEPTEMBER 5-12. CALIFORNIA DIAMOND JUBILEE.** During this week there was celebrated California's Diamond Jubilee in commemoration of the seventy-fifth anniversary of the admission of California into statehood. It began September 5 with a costume ball in the Civic Auditorium, San Francisco, under the direction of Gen. Thornwell Mullaly. On the 6th there was a fashion show pageant and on the 7th the Labor Day parade. A military parade was the leading event of the 8th, and on the 9th, Admission Day, there was a pageant parade portraying the history of California as well as a musical and literary program in the Civic Auditorium. The remaining events were largely sporting exhibitions, or of a musical character, and the celebration closed on the 12th with an electric night parade and a ball at the Audi-

torium. Vice-President Dawes was the guest of the occasion and he was given a banquet on the 9th. A commemorative half dollar was authorized by the Government in honor of the celebration.

**WASHINGTON BICENTENNIAL.** Plans for the proper and adequate celebration of the bicentennial anniversary of the birth of George Washington were slowly developing during 1925. Subsequent to the account contained in the *YEAR BOOK* for 1924 (p. 133) and after the convening of Congress, a bill was passed creating a commission of 19 members to consist of the President of the United States, the President of the Senate, and Speaker of the House, as ex officio commissioners; Senators Fess, Ohio, Spencer, Missouri (later deceased), Glass, Virginia, and Bayard, Delaware; Representatives Hawley, Oregon, Tilson, Connecticut, Garner, Texas, and Byrns, Tennessee. Those appointed by the President were: Mrs. Anthony Wayne Cook of Pennsylvania, president-general of the Daughters of the American Revolution; Mrs. Mary Sherman of Colorado, president-general of the Federation of Women's Clubs; Henry Ford of Michigan; Hanford MacNider of Iowa, former national commander of the American Legion; C. Bascom Slemple, former secretary to President Coolidge; A. Lawrence Lowell, President of Harvard; Edgar B. Piper, Portland, Oreg., publisher; Frank A. Munsey, New York, publisher, and John Hays Hammond of Washington, engineer. Of this commission Senator Fess became vice-chairman and Representative Tilson, secretary. This commission met at the White House on February 16, on the call of President Coolidge, when he said: "The two hundredth anniversary of General Washington's birth will be an occasion of such significance, not only to our country, but to the entire world, that it is manifestly fitting that the American nation should appropriately observe it. But beyond this, it is felt that as the life, the career and the achievements of Washington belong not to a single nation, but to all humanity, it is proper that the nation founded under his leadership should invite all other nations and peoples to join it in the observance of this anniversary. Every consideration of national pride in him as an American, of gratitude for the distinctions which he brought to us as a people, and of satisfaction in the universal recognition which has been freely rendered to his name and memory, dictate that this nation should take the lead in such a proper acknowledgment as will make the approaching bicentennial an occasion of universal inspiration. For the present, it is impossible more specifically to suggest the purposes and character of the commemoration which it is proposed to arrange. The commission will in due time take proper measures to enlist the interest of the nations in the observance of this inspiring anniversary." A preliminary report from the committee was transmitted to Congress in February, but to the end of the year no further public announcements had been published. See **EXPOSITIONS**.

**CELTIC STUDIES.** See **PHILOLOGY, MODERN**.

**CEMENT.** The preliminary statistics for 1925 showed an increase of production of Portland cement amounting to 8 per cent over 1924, and also an increase of some 7 per cent in shipments. The stock at the end of December in

1925 amounted to 18,429,000 barrels, as compared with 14,123,000 barrels at the end of 1924. The accompanying table shows the estimates of production and shipment of finished Portland cement in 1925, by districts, as compared with the corresponding figures for 1924.

<sup>a</sup> Began producing and shipping June, 1924.

<sup>b</sup> Began producing December, 1924.

**CENSUS, UNITED STATES.** The Bureau of the United States Census during the fiscal year 1924-25 had as its major duties the collection of detailed reports concerning agriculture from about 6,370,000 farms, the tabulation of statistics of manufacturers, including forest products, from data collected at the biennial session of 1923, covering 350 industries; the collection of certificates of births and deaths, covering all the details available and required by law; and the issuing of reports giving detailed statistics relative to marriages and divorces recorded for the calendar years 1922-23 and the obtaining of financial statistics from various cities and States.

According to Director William A. Steuart of The Bureau of Census, the outstanding work during the year was the census of agriculture taken as of Jan. 1, 1925. This was the first mid-decennial census taken under the act of Mar. 3, 1919, and requiring the appointment of a total temporary force of 26,401 persons, including 204 supervisors, 23,945 enumerators, and 2252 clerks for the offices of the supervisors and in Washington. Various agencies were used to obtain statistics, including other government services, and the enumeration was systematically made. A census of manufacture under the provisions of the act of Mar. 3, 1919, was taken in 1921 and 1923 and a similar census was to be taken for 1925. During the year statistics were tabulated from the data collected at the biennial census for 1923 from 196,000 establishments and particular attention was paid to the preparation of a correct list for the tabulation to be made in 1925

as there was considerable turnover, or mortality, so that the records must be carefully kept.

The Census Bureau during the year collected data in regard to births and deaths and summarized the information received from the various localities and in the case of deaths, the mortality by separate diseases. These figures were of importance as the foundation of public health work and as indicating the most promising direction for the expenditure of funds appropriated for such work and clearly show what degrees of success have attended previous campaigns for better health. These statistics showed decreases in the infant mortality rate and in the death rate from diphtheria, tuberculosis, and other diseases where efficient campaigns have been carried on, and at the same time indicated the work to be done in such fields as cancer and heart disease. See VITAL STATISTICS.

The Bureau of the Census also published every four weeks telegraphic returns of automobile fatalities from cities of 100,000 population or more and also endeavored to collect data which would permit the publication annually of two sets of death rates from motor vehicle accidents, one referring to the number of deaths reported from each locality, regardless of where the accident occurred and the other reporting the number of deaths due to accidents in each locality, regardless of where the deaths occurred.

The Census Bureau undertook also a Survey of Current Business to supply business men with current basic statistics in important lines of industrial and commercial activity. At the close of the fiscal year 1924-25, 103 trade and industrial operations were supplying the bureau with regular statistical reports for publication in the Survey of Current Business. The data in these reports was collected by the associations directly for the separate establishments and were sent to the bureau for publication. The information thus secured was published biennially, being made available for all persons, irrespective of their interests or industrial affiliations.

**CENSUSES, STATE.** During the year of 1925 the States of Florida, Rhode Island, South Dakota, Iowa, Kansas, Massachusetts, New York, and Wyoming made a census of the population of their respective citizens. These enumerations were used by the Bureau of the Census at Washington in making estimates of the population of the States as of July 1, 1925.

**CENTRAL AMERICA.** The name generally applied to the southern portion of the North American continent lying to the north of the Panama Canal and south of Mexico and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and San Salvador. See the articles on these respective countries.

**CEREAL DISEASE CONFERENCE.** See BOTANY under *Plant Diseases*.

**CEYLON, sē-lon'.** A British island in the Indian Ocean off the southern extremity of Hindustan. Its extreme length from north to south, i.e., from Point Palmyra to Dondra Head, is 266 miles; its greatest width 140½ miles from Colombo on the west coast to Sangemankande on the east. Its area is 25,332 square miles; population, according to the census of 1921, 4,504,549, as compared with 4,106,350 in 1911. The registered movement of population in 1923 was as follows: Births, 181,437; deaths, 141,891; marriages, 23,239. The chief cities with their populations in 1921 are: Colombo, 244,163; Jaffna,

42,436; Galle, 39,073; and Kandy, 32,047. In 1923 the number of vernacular schools were: Government schools, 1039, attended by 105,916 boys and 45,299 girls; aided schools, 1826, attended by 125,930 boys and 81,152 girls; unaided schools, 1010, attended by 14,885 boys and 5242 girls; English and Anglo-vernacular schools, 358, attended by 49,513 boys and 14,001 girls.

The total acreage of the island is 10,212,400, of which about 3,000,000 acres are under cultivation and 733,000 acres are pasture land. In 1923 the approximate areas under the principal products were as follows: paddy, 750,000 acres; other grain, 102,000 acres; cacao, 33,200 acres; cinnamon, 25,000 acres; tea, 418,000 acres; coconuts, 900,000 acres; rubber, 390,000 acres. In 1923 the livestock numbered 2000 horses, 1,383,000 horned cattle, 59,000 sheep; 50,000 swine, and 158,000 goats. Plumbago is the chief mining interest. At the end of 1923 there were 20 mines working. The exports in the same year amounted to 213,000 cwt. Monazite is of some commercial importance and there are resources of gold and thorium, although they have not been extensively developed. Gem quarries abound throughout the island and among the stones found are moonstones, rubies, cat's-eyes, and sapphires. The native manufactures include weaving and the making of tortoise shell boxes, earthenware, lacquer work, jewelry, carving, etc. They are not of much commercial importance however. The chief manufactures on a large scale pertain to agricultural products, including the extraction of cocoanut oil.

In 1923 the exports were valued at 351,198,748 rupees; imports, 292,159,784 rupees. The chief exports were tea, rubber, copra, and cocoanut oil; the chief imports, cotton manufactures, rice, and coal. The shipping entered and cleared in 1923 amounted to 16,253,000 tons, of which 10,309,000 were British. At the end of December, 1923, 734 miles of railways were open to traffic and several extensions were under construction. The administration, as embodied in an Order in Council of December, 1923, is in the hands of a governor, aided by an executive council of seven members and a legislative council of 49 members (12 official and 37 unofficial). Of the unofficial members, 23 are elected to represent territorial divisions, two to represent the Europeans, two the Burgher Community, one the Chamber of Commerce, one the Western Province Tamils, three the Mohammedans, and two the Indians. Governor at the beginning of 1925, Sir Hugh Charles Clifford.

The Maldive Archipelago, made up of 17 groups of islets, 400 miles west of Ceylon and sparsely settled by a mixed race of probably Aryan original stock, is tributary to Ceylon. The islands are covered with cocoanut palms and yield millet, fruit, and cocoanut produce. Communication is mainly by native craft with Ceylon and the mainland. The population numbered over 70,000 at the 1921 census. The islanders are civilized and are great navigators and traders.

**CHAMBER MUSIC.** See MUSIC.

**CHANDLER, CHARLES FREDERICK.** American chemist and educator, died at Hartford, Conn., August 25. He was born at Lancaster, Mass., and after studying at the Lawrence Scientific School of Harvard University went abroad to study at the Universities of Göttingen and Berlin, and in the laboratories of Woehler and

of Heinrich Rose. His first teaching position was as director of the Chemical Department of Union College, Schenectady, N. Y., in 1857. In the following year he became professor of chemistry at the New York College of Pharmacy. In 1864 in the newly organized School of Mines of Columbia College Chandler became professor of analytical and applied chemistry and was an important factor in the development of this technical school. With Professor Egleston, Professor Newberry and several others Chandler organized a school of applied science based in a large measure on the French School of Mines, and as it flourished other courses besides those of mining engineering were added. He served as dean of the School of Mines from 1864 until 1898. The school during his incumbency grew to fill an important need in training practical men of high scientific attainments to assume engineering, manufacturing, and other technical responsibilities, and there was a demand for its graduates. The courses in chemistry, in particular, were developed by Dr. Chandler so that the graduates were recognized as men of unusual training and many of the graduates at once assumed important positions both as scientists and technologists. In 1876 Dr. Chandler became professor of chemistry and medical jurisprudence in the College of Physicians and Surgeons, which later became intimately connected with Columbia University. Chemist of the Board of Health of the City of New York in 1865, he became in 1873 president of that body, and accomplished many important reforms such as the segregation of slaughterhouses and the rule that plans of tenement houses be submitted to the Board of Health. He also carried out a system of inspection safeguarding the milk supply of the city, and other important reforms. He served as president of the American Chemical Society in 1881 and 1889 and in 1899 he was president of the British Society of Chemical Industry. He was a member of the National Academy of Sciences and president, 1899-1900, of the Chemists' Club of New York. In 1870 he established the *American Chemist*, a monthly magazine which was issued from 1870-1877. His more notable papers include *Report on Petroleum as an Illuminator* (1871); *Report on the Waters of the Hudson River* (1872); and *Manual of Qualitative Analysis* (1873).

**CHAPMAN, CARLTON THEODORE.** American artist, died February 12. He was born at New London, Ohio, September, 1860, and after studying at Oberlin College attended the art school of the National Academy of Design and Art Students' League of New York. He also studied at the Académie Julien in Paris. He made a specialty of marines and landscapes and in particular depicted naval battles of the United States from the time of John Paul Jones. He received many medals and honors including a silver medal at Boston, 1892; a medal at the Chicago Exposition, 1893; the Atlanta Exposition, 1895; the Buffalo Exposition, 1901; and the Charleston Exposition, 1902. He was elected a member of the National Academy of Design and served as member of the International Jury of Awards at the St. Louis Exposition of 1904. During the Spanish American War of 1898 he was a war correspondent and artist for *Harper's Weekly* and some of his most interesting work depicted the battleships and other craft of that time. Among his pictures are "The

Derelict" and "The U. S. S. *Gloucester* and the Spanish Torpedo Boats" (1904); "A Squally Day—North River," "The Walls of New York," and "Off Ellis Island" (1905); "The *Argus* and the *Pelican*," "The *Bonhomme Richard* and the *Serapis*," and "The Lighthouse" (1910); "O'er the Dark Sea," "The Pacific Coast," and "October" (1911); "The Mystic Pool" and "Battle of Cape St. Vincent" (1912).

**CHARITIES.** See CHILD LABOR; OLD AGE PENSIONS; RED CROSS; RELIEF FOR WAR VICTIMS; RUSSIA; SOCIAL WORK; UNEMPLOYMENT; YOUNG MEN'S CHRISTIAN ASSOCIATION; YOUNG WOMEN'S CHRISTIAN ASSOCIATION and the various articles on religious bodies and societies with charitable activities.

**CHASE, RT. REV. FREDERIC HENRY.** Bishop of Ely, and a leading British scholar, died September 23, at Bexhill. He was born, Feb. 21, 1853, in London and was educated at King's College School, and Christ's College, Cambridge, graduating with high honors in 1876. After his ordination in 1877 he returned to Cambridge in 1879 as curate of St. Michael's, and in 1881 was appointed theological lecturer at Pembroke College. In 1884 he was made first vice-principal of the Clergy Training School at Cambridge. Becoming principal in 1887, he served until 1901. In 1893 he was appointed theological lecturer in Christ's College and in 1901 he was made president of Queens' College, and a few months later Norrisian Professor of Divinity. In 1902 Dr. Chase was elected vice-chancellor of the University. In 1905 he became Bishop of Ely, serving until 1923 when ill health forced his resignation. From his earlier days Bishop Chase was known as an authority on the New Testament and early Christian literature, and later was the champion of orthodoxy and conservatism in the church, resisting inroads of the modernists. He was chairman of the Lambeth Conference Committee of 1920 on "the position of women in the councils and ministrations of the Church." His works in addition to articles in religious encyclopedias and reviews, include: *Chrysostom* (1887); *The Lord's Prayer in the Early Church* (Texts and Studies, 1. iii.) (1891); *Old Syriac Element in Codex Bezae* (1895); *Syro-Latin Text of the Gospels* (1897); *Clement of Alexandria* (a lecture) (1897); Articles on "St. Peter," "I Peter" and "II Peter" in *Hastings' Dictionary of Bible* (1900); *Credibility of the Book of the Acts* (1901); Essay on the "Gospels in the Light of Historical Criticism" in *Cambridge Theological Essays* (1905), (republished separately with Preface) (1904); *Confirmation in the Apostolic Age* (1909); *Belief and Creed* (1918); *The Creed and the New Testament* (1920); and *What did Christ teach about Divorce?* (1921).

**CHAUTAUQUA INSTITUTION.** An educational movement established in 1874 by Lewis Miller and Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. The institution always has been non-sectarian in principle, though the original idea of the organization was a Sunday school for teachers; the purpose was to conduct a summer school where a series of correlated lectures and entertainments were presented during the months of June, July, and August. The three general fields of activities are: the general assembly, consisting of an educational and popular series of lectures and addresses, concerts and dramatic

entertainment, etc.; the summer schools, offering a course of formal classroom instruction; and a home reading circle in which a set of four books is designated for reading during the year, besides a news narrative appearing in a monthly review. In 1925 there were in the summer schools 18 departments, 125 instructors, and 2500 students, while the attendance at the annual session was estimated at 50,000. *The Round Table*, the official monthly bulletin, is principally informative of the organization's teaching purposes. The first Tuesday in August each year "Old First Night" is celebrated in commemoration of the original assembly. Financial support is obtained largely through individual gifts. Permanent buildings are owned by the Institution at Chautauqua, N. Y., where the general summer assemblies are held, and the Chautauqua Press is located. The value of the property and buildings was estimated at \$1,250,000. Officers: George E. Vincent, Honorary President; Arthur E. Bestor, President; William L. Ransom, Chairman of Trustees; Shailer Mathews, Chairman of Executive Board; Charles E. Pierce, Secretary; and Jessie M. Leslie, Treasurer.

**CHEESE.** See DAIRYING.

**CHEMICAL FOUNDATION.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL INDUSTRIES.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL SOCIETIES.** See CHEMISTRY, INDUSTRIAL.

**CHEMICAL WAR SERVICE.** See MILITARY PROGRESS.

**CHEMISTRY.** The progress of chemistry continued uninterrupted in 1925. During the year announcement was made of the discovery of three new elements but their properties as well as those of their compounds received little attention. The advance in the progress of the science was distinct but there was no wonderful or startling discovery. It was simply a year of steady advancement.

**NEW ELEMENTS.** Dr. Walter Noddack and Dr. Ida Tacke, assisted by Dr. Otto Berg, announced from Berlin, Germany, on June 15, their discovery of two new elements (contained in the mineral columbite), which they named "masurium" after the East Prussian lakes, and "rhenium," after the river Rhine. Both elements are exceedingly rare, comprising about one-billionth of the earth's crust. Only three elements are now undiscovered of the 92 enumerated by Mendeleeff. The elements just discovered are numbered respectively 43 and 75 on the Mendeleeff list. The discovery was announced before the Czech Academy of Sciences in November by Prof. Jaroslav Heyrovsky, professor of physical chemistry in the University of Prague, of a new element to which the name of bohemia was given and its place corresponds to the number 75 in the classification of elements. It will be noted the atomic number of this element is the same as that of rhenium mentioned above.

**ATOMIC WEIGHTS.** There were a number of revisions of the atomic weights of the elements during the year as the following items will show. E. Moles in an important paper (*Zeit. Phys. Chem.*, vol. 115, p. 61) on "Fundamental Atomic Weights" discussed modern physico-chemical and chemical values for the atomic weights of hydrogen, chlorine, bromine, and sil-

ver, respectively. He contends that there is no discordance between the values obtained for hydrogen, chlorine, and bromine by physico-chemical methods and those obtained by purely chemical methods, and the mean values are given as hydrogen, 1.00777; chlorine, 35.458; bromine, 79.918. The atomic weight of silver, according to the author cannot be less than 107.880, but is somewhat greater than 107.882.

P. J. Weatherill in the *Journal of the American Chemical Society* (vol. 46, p. 2437) reports that from antimony trichloride prepared by the action of chlorine on pure antimony in a vacuum, he determines the atomic weight of antimony to be  $121.748 \pm 0.00086$ . The atomic weight, of silicon was reviewed by O. Hönigschmidt and M. Steinheil, who report that by determining this factor from four analyses of silicon chloride a mean value of 28.105 with a mean deviation of  $\pm 0.003$ . Mlle. Gleditsch finds that no difference can be detected in the atomic weights of chlorine contained in carefully purified silver chloride from (1) volcanic ammonium chloride produced in an eruption of Vesuvius, (2) water from a depth of 1573 meters (5160.74 feet) in the Calumet and Hecla mines near Lake Superior, and (3) ordinary barium chloride. In consideration of the occurrence of hafnium with zirconium, O. Hönigschmidt, E. Zintl and F. Gonzalez have redetermined the atomic weight of zirconium. They find the mean value for the atomic weight of this element determined by use of the bromide to be 91.22. P. Bruylants, F. Lafortune and L. Verbruggen reported to the Chemical Society of Belgium that after numerous determinations they found the atomic weight of selenium to be 79.23. As a means of fifteen experiments A. Classen and G. Strauch found the value of 208.980 for the atomic weight of bismuth. This confirmed the value 209 found by Classen and Ney and contradicted that of 208 given by von Schneider and Gutbier. The atomic weights of carbon and silver were redetermined by G. Dean who reported that from 21 experiments a mean value of  $12.002 \pm 0.0001$  was obtained for carbon if silver be 107.88 and nitrogen 14.008. This was determined from silver cyanide. The mean of the experiments, using the cyanate gave  $12.003 \pm 0.001$ . By combining the cyanide and cyanate series, new independent values for the atomic weight of silver gave 107.871 and the equivalent of cyanogen equals 26.008, involving no other assumption than that oxygen equals 16. Those veteran workers in this branch of chemistry, O. Hönigschmidt and E. Zintl report the atomic weight of hafnium to be 180.8, while G. Hevesy finds it to be  $178.6 \pm 0.1$ . A later study by these authors using hafnium bromide gives a value of  $178.6 \pm 0.08$  as their result.

The atomic weight of boron was redetermined by H. V. A. Briscoe and P. L. Robison who in the *Journal of the London Chemical Society* (vol. 127, p. 696) reported that the mean value of the atomic weight of boron from California was found to be 10.840 and that from boron from Tuscany and Asia Minor 10.820. These values indicate that a partial separation of the isotopes 10 and 11 has occurred in nature, the American boron containing 84 per cent and the Eurasian 82 per cent of the heavier isotope. Atomic weight determinations based on the analysis of fused borax were open to criticism according to these authors.

Two American chemists, F. H. Driggs and B. S. Hopkins determined the atomic weight of the rare element holmium to be 163.47. R. Ruer and K. Bode reported their determinations of the atomic weight of copper, using cupric oxide and they agree with previous results in showing that 63.546 as the atomic weight of copper is trustworthy. According to H. Krepelka and N. Nikolic the mean of five determinations of the ratio  $\text{AlCl}_3$  is to 3Ag and of two determinations of the ratio  $\text{AlCl}_3$  is to  $3\text{AgCl}$  gave 26.971 as the atomic weight of aluminum when 35.458 and 107.880 were taken as the atomic weights of chlorine and silver respectively.

**ANALYTICAL CHEMISTRY.** Under this heading are included new methods or improvements in methods of analysis, both qualitative and quantitative, as well as improvements in apparatus used in various methods of analysis.

According to F. L. Hahn and H. Wolf (*Ber. Deut. Chem. Gesell.*, vol. 57, p. 1858) the complete Separation of Arsenic and Antimony is possible by distillation of solutions of the chlorides, provided the distilling flask is placed on an asbestos board pierced with a small hole and heated with a small flame that touches only that portion of the glass that is invariably covered by liquid. The operation is tedious and requires great care. A rapid and quantitative separation is obtained, however, if the flask is provided with a fractionating inset which is illustrated in the original article. In the *Chemiker Zeitung* (vol. 48, p. 893) K. Kieper described a new method for the Volumetric Determination of Zinc. He finds that when an excess of standard sodium sulphide solution is added to the ammoniacal zinc solution, then after heating the mixture, the precipitate is filtered off. The filtrate containing the zinc is cooled, acidified with acetic acid, and titrated with iodine. Automatic Gas Analysis is the title under which L. Lowenstein (*Zeit. Physiol. Chem.*, vol. 110, p. 799) describes a method for the accurate determination of small quantities of hydrogen, methane, etc., in pressure of a large excess of oxygen (or vice versa) in which the gases after passing through a combustion chamber, enter a hair hygrometer, the alterations in the length of the fibre being an indication of the water content, that is of the hydrogen or oxygen content of the original gas.

The conductivity of water was found by F. Bordas and F. Touplain (*Ann. Falsif.*, vol. 17, p. 576) to afford the best physical test of its composition. According to these authors the presence of even small numbers of hydrogen and hydroxyl ions allows the passage of a current, and dissolved gases, particularly carbon dioxide, appreciably increase the conductivity. If however, as much as 300 mg. of salt to the liter is present the effect of the dissolved gas disappears. J. W. Springer (*Zeits. Anal. Chem.*, vol. 65, p. 315) described the Electrolytic Determination of Zinc especially in the presence of copper as follows: The nitric acid solution of the two metals is neutralized with ammonia, sulphuric acid is added, and the copper deposited on a rotating cathode from the boiling solution. The electrolyte freed from copper is then neutralized with sodium hydroxide, treated with a further 10 grams of the alkali, and electrolyzed for 20 minutes, using a rotating cathode of amalgamated brass gauze.

A new Method for the Detection of Citric Acid is described by Rodillon (*Report. Pharm.*, vol. 35, p. 233) as follows: The solution to be tested is boiled with a small quantity of potassium dichromate solution, and a mixture of acetic acid and sodium nitroprusside is added after cooling. Ammonium hydroxide solution free from acetone is added without mixing, when acetone produced from the citric acid generates a violet red color at the surface of contact. Alternatively the acetone may be detected by the iodoform reaction. In the *Zeitschrift für Anorganische Chemie* (vol. 140, p. 253) M. Dimitroff describes a new Test for Chlorine, Bromine, Iodine, etc., as follows: The substance is oxidized by potassium permanganate in acid solution in a flask so fitted that air can be passed through the solution during the process and passed together with the halogens evolved, but into a solution containing one or two drops of 0.1 normal ammonium bromide in 10 c.c. of 2 normal sulphuric acid. Here any chlorine from the original substance replaces bromine in the solution. One to two drops of sodium bromate are now added while air (now pure) is still passed through. The bromide is oxidized and the bromine passes off while the chloride remains unaffected, thus a precipitate with silver nitrate indicates chlorine in the original substance.

Color Standards for Use in the Determination of Glyoxalines were studied by G. Hunter, who reported in the *Biochemical Journal* (vol. 19, p. 42) that he finds commercial Congo-red and methyl-orange must be purified before use as artificial standards in colorimetric work. Therefore in his article he gives details for the preparation of a color standard made from pure Congo-red and methyl-orange that is most suitable for the determination of histidine or carnosine. In the *Journal of the Society of Chemical Industry* (vol. 44, p. 115) A. O. Jones described a new two-bulbed absorption pipette in which the bulbs are joined by rubber tubing in place of the usual rigid glass tube, and a funnel and stopcock are attached to the top of the absorption bulb. By this means the gas in the pipette may be washed with more than one reagent without transferring it to the burette, one pipette can be used for all the reagents, and fouling of the mercury by the reagents is lessened.

E. B. Johnson and L. M. Dennis (*Journ. Amer. Chem. Soc.*, vol. 47, p. 790) for the determination of Germanium recommend that this rare metal be precipitated from acid solutions as the disulphide, the precipitate then dissolved in ammonia, oxidized with 3 per cent hydrogen peroxide, and weighed as the dioxide. A Portable Gas Analysis Apparatus was described by H. D. Murray (*Journ. Chem. Soc.*, vol. 127, p. 769) as follows: A gas burette is connected by means of a three-way stopcock to a sparking chamber provided with a mercury reservoir; this is similarly connected to a pipette having two in-leads, one through which the gas is drawn, reaching to the bottom of the bulb; suitable absorbents are drawn up into the pipette as required; the analyses are carried out in the usual way.

H. ter Meulen (*Recueil des Travaux chimiques*, vol. 44, p. 271), a Dutch chemist, described an improved method for the Determination of Nitrogen in Oil, Coke, and Proteins.

He stated: The material is thoroughly mixed with seven times its weight of sodium carbonate and heated in a current of hydrogen saturated with water vapor at 100 C. The whole of the nitrogen is converted into ammonia, which is determined in the usual way. Proteins give figures by this method generally slightly higher than those obtained by the Kjeldahl Method, but pure organic substances give figures corresponding exactly with the theoretical.

W. W. Reed in *Chemistry and Industry* (vol. 44, p. 422) described a new form of Apparatus for Determining Carbon Dioxide. He finds that instead of washing out the carbon dioxide by aspirating air through the apparatus that the gas may be withdrawn by suction from the bottom of the flask, the calcium chloride tube being sealed to another tube, the height of which above the liquid is adjustable.

According to R. Fricke (*Zeit. Anorg. Chem.*, vol. 44, p. 267) the Separation of Gallium from Aluminum and Iron may not be conveniently effected from large amounts of iron or aluminum by precipitating the latter with excess of ammonium hydroxide except in cases when the gallium is nearly pure. According to R. Meurice (*Ann. Chim. Analyt.*, vol. 7, p. 161) the Determination of Potassium may be effected by precipitating the potassium as hydrogen tartrate in the presence of alcohol (99 per cent methyl alcohol containing only traces of acetone was used) and after thoroughly washing the precipitate, the potassium is determined by titration with sodium hydroxide solution in the presence of phenolphthalein. If the proportion of potassium chloride is between 1 and 0.8 grams dissolution of the precipitate in the alcohol is negligible and results are accurate to 0.5 per cent. The presence of nitrates and magnesium does not effect results and sulphates merely lengthen the time of precipitation.

For the Rapid Determination of the Acid Value of Oils, S. Somazzi (*Chem. Zentrbl.*, vol. 2, for 1924, p. 1530) recommended that exactly 1 gram of oil be shaken in a graduated pipette with an equal volume of ether and alcohol to complete solution, when the acid is titrated with 0.1 normal sodium hydroxide, using phenolphthalein as indicator. In the *Chemical News* (vol. 131, p. 17) W. W. Scott recommends for the Determination of Lead in Minute Quantity, as in baking powder, food, etc., that the lead in the material under investigation be converted into sulphate, extracted by means of ammonium acetate, converted into sulphide, and the sulphide determined colorimetrically by comparison with standard solutions. To determine lead in water, aluminum sulphate and sulphuric acid are added, and then ammonia; the lead is occluded in the precipitated aluminum hydroxide, and may then be determined by the method indicated above.

Under the title of "Separation of the Alkalis in Silicate Analysis," O. Cantoni points out (*Zeit. Anal. Chem.*, vol. 67, p. 33) that in the method of Berzelius for decomposing silicates by hydrofluoric and sulphuric acids time may be saved and a preliminary separation of the iron, alumina, and alkaline earths effected by evaporation of the sulphuric acid completely to dryness followed by ignition of the crucible to a dull red heat. The cold mass, when extracted with water leaves a residue free from alkalis and the solu-

tion may be treated immediately with barium chloride to remove sulphuric acid and convert the alkalis into chlorides. The analysis is finished as usual.

**BIOCHEMISTRY.** This branch of chemistry treats of life; the composition of various compounds, whether animal or vegetable, that are produced by life, their functions, and their effects on other substances. Its most important branch is probably the one that has to do with medical science.

A conspicuous discovery announced in January by Dr. Herbert M. Evans of the University of California, was of vitamin X which he obtained as a result of studies with guinea pigs, rats, and tadpoles. In his announcement he called attention to the small pituitary gland at the base of the brain called the "hypophysis." Science had already met with success in removing that gland from animals and substituting fluid extracts from it for injections given the same animals. It was found that when animals were treated with this fluid, provided it was not given by the mouth, but under the skin or in body cavities where it could not come in contact with the digestive tissues, and was administered daily, rather than at infrequent intervals, it was possible to turn normal animals into giants. Experiments were being made to purify the pituitary gland fluid so that it may be used in human cases as a restorative. Concerning his success in regulating propagation of animals with glandular nutrition the discoverer claimed that it would be difficult to make any statement regarding the practical significance of the work, primarily because of the fact that the new vitamin is abundantly distributed in common foods.

In September it was reported that A. Katsumi Takahasi and other investigators, working in the laboratory of Prof. U. Suzuki in the Institute of Physical and Chemical Research at Tokio, announced having extracted and analyzed vitamin A from cod-liver oil, spinach, and green laver, a seaweed. It comes out finally as a yellowish red oil, transparent and viscous, with a characteristic odor and a slightly bitter taste, resembling somewhat the yellow matter of carrots and green leaves. It is not so unstable as had been supposed, for it can be distilled in a vacuum without decomposition. To this compound its discoverer gave the name of biosterin.

S. Leites (*Biochem. Zeit.*, vol. 150, p. 183) under the title "Endocrine Glands and Blood Calcium," reported that the blood calcium of the rabbit falls after removal of the thymus and parathyroid glands—slowly in the former case, rapidly in the latter—whilst a temporary rise followed by a fall in blood calcium is produced by thyroidectomy or by removal of testes or ovary. Administration of glandular preparations to the operated animal corrects these abnormalities. According to K. Myrback and B. Everett (*Zeit. Physiol. Chem.*, vol. 139, p. 272) the experiments of von Furth and Lieben on the destruction of lactic acid by yeast were confirmed. According to M. Richter-Quittner (*Wien. Med. Woch.*, vol. 74, p. 948) a study of the Mineral Content of Blood Plasma shows that calcium salts administered *per os* or intravenously cause an increase in calcium and a decrease in sodium, not only in the plasma, but also in the serous body-fluids. Administration of sodium causes retention of water, while in the

case of calcium diuresis with elimination of sodium in the urine is produced.

An interesting study of the Effect of Methyl and Ethyl Alcohols on the Growth of Barley Plants was made by A. N. Puri (*Ann. Bot.*, vol. 38, p. 745). He found that ethyl alcohol was more toxic to barley plants than was methyl alcohol. The former favored the growth of ear shoots at the expense of leaves, while the latter had the reverse effect. One curious fact was found and it was that the resistance of plants to ethyl alcohol increases with age. K. Gollnitz-Meier and C. Kroetz (*Biochem. Zeitsch.*, vol. 154, p. 82) studied the Chemistry of the Blood during Sleep, and found that the sensitivity of the respiratory centre is diminished, acidosis occurs, and liquid rich in sodium chloride and phosphate but poor in proteins, passes from tissues to blood. The Biochemistry of Cancer Formation is the subject to which R. Bierich and A. Rosenbohm (*Biochem. Zeitsch.*, vol. 152, p. 193) had given much attention. They found that the cancer cells in the epithelium by degradation of carbohydrates produce lactic acid which diffuses into the connective-tissue below where it alters the protein of the collagen fibres into a gelatin-like substance which promotes the further growth of the cancer cells.

C. Benguerel (*Ann. Chem. Anal.*, vol. 7, p. 40) describes a new method for the Detection of Urobilin and Urobilinogen in Urine as follows: The urine which has been slightly acidified with acetic acid, is shaken with an ethereal alcoholic solution of zinc acetate, and the fluorescence developed is examined with an arc light against a black background. The transformation of urobilinogen may take a few minutes. Two Italian chemists, P. Mazzocco and V. Morera (*Compt. Rend. Soc. Biol.*, vol. 91, p. 30) found that the Effect of Insulin on the Composition of the Blood is as follows: After administration of insulin to dogs the total nitrogen, inorganic phosphorus, and alkaline reserve of the blood decrease. No decrease occurs in residual nitrogen, calcium, potassium, or magnesium. Normal composition is restored after a few hours.

A. A. Kalushski in a study on Sulphur as an Accessory Fertilizer showed that in experiments with millet, sulphur used in conjunction with mineral phosphate had a favorable effect on yield. A valuable study on the Effect of High Fat Diets on Content of Uric Acid in Blood was made by V. J. Harding, K. D. Allin, B. A. Eagles, and H. B. Van Wyck. (*Journ. Biol. Chem.*, vol. 63, p. 37.) They found that the administration of a diet of which the fat content is sufficiently high to produce a ketosis brings about an increase in the concentration of uric acid in the blood. This increase can be partly accounted for by decreased excretion consequent on decreased blood volume; the highest concentrations of uric acid were observed in the blood of those individuals who excreted the largest amounts of acetone.

R. E. Liesegang in studying the Calcium Chemistry of Teeth (*Deut. Zahnartztl. Woch.*, vol. 27, p. 103) found that the carbon dioxide and other acids produced by intracellular respiration prevent the deposition of calcium carbonate and calcium phosphate in the tissues. The connective-tissues in which the calcium salts of bone and teeth are deposited are relatively

poor in cells. It is not necessary to postulate specific calcium fixers. The transparent zone in dental caries is the result of local hypermineralization.

In the *Journal of the Society of Chemical Industry* (vol. 44, p. 95) A. Renshaw gives an account of the discovery, commercial preparation and purification, physiological effects, and standardization of insulin. He finds that incubation at 37°C. appears not to destroy the activity of insulin. The Significance of Copper in the Animal Organism was made the subject of an interesting study by G. B. Zanda (*Biochem. Therap. Sperim.*, vol. 11, p. 7). He finds by using the hematoxylin test and the phenolphthalein blood reaction for copper that this element, i.e., copper, was found in all the organs of dogs, and of most other animals examined. Considerable amounts were found in the feathers of birds, and appreciable quantities in the shells of snails. No copper was found in butterflies, fibrin, dog's urine, or in egg-white. He concludes that copper is a definite constituent of animal tissues.

Under the title of "Uroflavine, A New Pathological Constituent of Urine," H. Reinwein (*Zeit. Ges. Exp. Med.*, vol. 42, p. 228) reported that urine obtained in certain diseases of the liver, after concentration, was rendered alkaline and extracted by shaking out with trichloroethylene, whereby a basic constituent, insoluble in water, was obtained which yielded an oily chloroaurate. The urine was further extracted three times with trichloroethylene after acidifying with sulphuric acid. After distilling off the solvent a brownish-yellow residue was obtained of which the portion insoluble in water yielded uroflavine having the composition,  $C_{20}H_{22}O_5N_2$ , and consisting of yellow rosettes with a melting point of 244°C. This new compound gives a strong diazo reaction and is not identical with bilirubin or its derivatives.

A curious study was made by P. Mazé on the Influence of Fluorine and Iodine on Reproductive Power of Rats and on the Growth of Young. (*Comptes Rendus*, vol. 180, p. 163.) He found that rats fed on a balanced diet containing skimmed milk powder are not able to reproduce unless potassium iodide and fluoride are added to the diet, when they are also enabled to feed their young sufficiently to promote growth. Phosphates appear to play no part in conferring reproductive power.

The study of the properties of insulin continued to be a favorite one, and J. A. Collazo and J. Lewicki (*Biochem. Zeitschrift*, vol. 158, p. 136) investigated the Effect of Insulin on the Lactic Acid of the Blood. They report that insulin administered in large quantities to starving normal animals causes at first, as a result of dyspnoea, a rise in blood lactic acid which however has nothing directly to do with the physiological activity of insulin. Following moderate doses of insulin, there is usually in normal starving men and rabbits a fall in the level of this acid in the blood. With dogs, even larger doses produce no rise in the blood lactic acid, provided respiration is artificially controlled. The simultaneous administration of insulin and sugar, the more normal physiological process, usually produces an increase in blood lactic acid.

The Phosphorus Content of the Blood of Ruminants was studied by H. D. Kay (*Biochem.*

*Journ.*, vol. 19, p. 447) who found that the main shortage of phosphorus in the blood of the cow, goat, and sheep, as compared with the blood of rodents or of man is in the fraction not hydrolyzable by bone enzyme. The quantity of phosphoric ester hydrolyzed by bone enzyme is low for all three ruminants.

The nature and occurrence of Soil Acidity were discussed and methods for the determination of acidity and lime requirement examined practically by E. Kureckmann. (*Zeit. Pflanz. Dung.*, vol. 54, p. 1.) He reported that in the light of the classification of acidity into three forms: active, exchange and hydrolytic (Kappen) variations in soil acidity due to origin, position, moisture, and humus content are examined and recorded. According to H. Colin and A. Grand-sire (*Compt. Rend.*, vol. 181, p. 133) who studied the amount of Mineral Matter in Green and in Chlorotic Leaves, albinism or congenital chlorosis in leaves leads to a higher ash content, although the percentage of dry matter is smaller than in normal green leaves. The ash of chlorotic leaves contains less calcium and more potassium. These differences are not found in etiolated or autumnal leaves, and thus do not always accompany an absence of chlorophyll.

In the *Comptes Rendus* (vol. 181, p. 236) A. Pictet, W. Scherrer, and L. Helfer reported the results of their studies of the Presence of Argon in Living Cells. They find that the traces of argon produced in the fermentation of dextrose are always present in the yeast. The following quantities of argon are present in 1 gram of the dried tissues named: yeast, 0.28-0.31 c.c.; sheep's brain 0.86 c.c.; coagulated ox-blood 0.84 c.c. Since neither fibrin nor hemoglobin obtained from ox-blood contains argon the presence of the latter in the blood clot is not due to superficial absorption. Possibly the argon is occluded in the cells and escapes when these are ruptured.

**INORGANIC CHEMISTRY.** Under this heading is included the chemistry of the so-called mineral compounds, and also the division known as physical chemistry which treats of the application of physical laws to inorganic compounds.

A brilliant piece of investigation in the last-named field is concerning the green line in the aurora borealis which has always been of the greatest interest. J. C. McLennan of the University of Toronto showed that an artificial production could be accomplished when the cathode rays were passed through a partly exhausted tube containing about 25 parts of helium to one of oxygen. Thus the origin of all the observed colors in the northern lights are now known, and much important evidence becomes available concerning the composition of the upper atmosphere.

F. W. Aston in discussing the Rarity of the Inert Gases on the Earth, pointed out in *Nature* (vol. 114, p. 786) that it is considered probable that the apparent rarity of the inert gases, as compared with the abundance predicted by their positions on the mass-number curves, is in fact real. In collisions of bodies resulting in the formation of a solar system, such atoms unconstrained by chemical combination would collide and rebound indefinitely, gravitating towards the larger masses, such as the sun. The Reducibility of certain Metallic Halides by means of Hydrogen was studied by F. de Carli (*Att. R. Accad. Lincei*, vol. 33, p. 94) who made

measurements of the proportions of the halides undergoing reduction at various temperatures when a definite quantity of hydrogen is passed over stannic, stannous, cupric, cuprous, lead, and cobalt halides. The chlorides are reduced in smaller proportion than the bromides and these in smaller proportion than the iodides, and the halogens are given up the more readily by the metal with the higher than by the same metal with lower valency.

F. Simon after an extended study of the Chemical Constants of Monatomic Gases, reports (*Zeit. Phys. Chem.*, vol. 110, p. 572) that a comparison of the recently determined values of the chemical constants of fourteen elements with the theoretical values showed that the deviations increase with increasing heats of vaporization. The Melting Point of Platinum was redetermined by F. Hoffmann for use as a thermometric fixed point by means of comparisons at three wave-lengths of the intensities of the black body radiation from an iridium resistance furnace, maintained successively at the melting points of gold and platinum. The value adopted for the melting point of platinum is  $1771 \pm 2^\circ$ .

According to F. M. Kannehstine the Life of Metastable Helium atoms is  $\frac{1}{140}$  second. He also found (*Astrophys. Journ.*, vol. 59, p. 133) that the critical frequency was independent of the pressure over a large range of pressure, a condition which is considered to be caused by a long-lived abnormal atom. The departure of the critical frequency-pressure curve from a straight line at low pressures is interpreted from the point of view of diffusion of the atoms from the arc space. The abnormal atoms are stable in pure helium, but revert to the normal atoms in the presence of impurities, that is in circumstances in which the selective principle is violated.

M. Brutzkus discusses in the *Comptes Rendus* (vol. 180, p. 197) a Method of Producing Chemical Reactions. He finds that a chemical reaction may be directed or accelerated by means of continuous and simultaneous variations of pressures, temperature, and concentration opposite to those resulting from the desired reaction, whereby a series of impulses is given to the reaction. Metals and metal oxides which catalyze gaseous reactions probably alter the conditions of pressure and concentration by differential absorption of the reacting gases, and of temperature by rapid conduction of the heat liberated, thus preventing the reversible reaction from setting in. Internal combustion engines provide the best means of studying chemical reactions under such conditions.

In an interesting study on the Number of Free Electrons with a Metal, E. H. Hall (*Proc. Nat. Acad. Sci.*, vol. 11, p. 36) stated: The relations existing between the atoms, the free electrons, and the positive ions within a metal are essentially those of dissociation equilibrium, there being certain essential mechanical differences between the condition of the ions within a solid metal and those in a liquid solution which render the third law of thermodynamics inapplicable. The number of free electrons may be as great as 2 or 3 per cent of the atoms at the ordinary temperature and the alteration of the number of free electrons with rise of temperature need not be in accord with the reaction isochore equation. The "ionizing poten-

tial" of metals varies from 0.125 volt in cobalt to 0.33 volt in iron at  $0^\circ$ , a much smaller quantity than the ionizing potential of the corresponding metal vapor.

There may be a practical value of importance in the study by A. L. Norbury on the Effects of certain Elements on the Electrical Resistivity of Copper, in which he claims that the effect of dissolved elements on the electrical resistivity of copper is small when the affinity of the element for copper is small, but the resistivity of the metal is increased greatly when the alloying element has a greater affinity for copper.

K. Honda, a Japanese chemist of the Tohoku University, finds that neither the properties which are variable, nor the method of production, which is not always known, are suitable criteria for Definitions of Steel and Cast-Iron, but that steel may be completely defined as "an iron-carbon alloy with a content of carbon lying between 0.035 and 1.7 per cent. The lower limit is given by the solubility of carbon in iron at the ordinary temperature, the upper limit being the maximum solubility of carbon—in iron at high temperatures." On the same grounds cast-iron is defined as an "iron-carbon alloy with a content of carbon lying between 1.7 and 6.7 per cent," the upper limit in this case representing pure cementite.

The Physical Properties of Nacreous Sulphur were studied by H. Whitaker (*Journ. Physical Chem.*, vol. 29, p. 399) who reported that when sulphur condenses on a glass plate in droplets, these droplets gradually assume various crystalline structures. Nacreous sulphur forms six-sided plates having the three pairs of opposite sides parallel. The colors shown by these plates are due to interference. The plates gradually disintegrate on ageing, which is probably due to their passing into the more stable octahedral variety.

The Structure of Alloys is always an appealing subject, and A. Westgren and G. Phragmén had turned their attention to it. They found that an ideal solid chemical compound was defined by the chemical identity of the structurally equivalent atoms. In an ideal solid solution all the atoms are structurally equivalent. These two types of structure are to be regarded as limiting cases; most metallic phases represent intermediate stages. Many alloys can be regarded as solid solutions in intermetallic compounds, the formulas of which may be obtained by means of the X-ray spectrograph. Certain structural types are found in several different alloys. Thus the X-ray spectrograms (by the powder method) for certain phases of the copper-zinc, silver-zinc, silver-cadmium, silver-aluminum, copper-tin, and silver-tin systems correspond with the interference forms of the latter with the closest possible hexagonal packing of spheres. Agreements of this type bring out important relationships between different systems of alloys.

A. F. O. Germann reported in *Science* (vol. 61, p. 70) that he found Carbon Monoxide to be a Product of Electrolysis. His results show that the specific conductivity of carbonyl chloride at  $25^\circ\text{C}$ . is  $0.007 \times 10^{-8}$ . Electrolysis of a solution of aluminum chloride in carbonyl chloride results in the solution of carbon monoxide and chlorine.

The physical properties of "permalloy" a nickel-iron alloy containing about 80 per cent

nickel were studied by E. M. Deloraine who found (*Journ. Phys. Radium*, vol. 6, p. 20) that the maximum permeability is obtained by heating the material at 900° for an hour, allowing it to cool slowly, reheating at 600°, and allowing it to cool more rapidly. Its magnetic properties are affected by heat treatment, by mechanical strain, and by the presence of impurities of which carbon is chief. The initial permeability at the ordinary temperature of this alloy may be more than 30 times that of soft iron. Among the uses for which the alloy is recommended is for use in submarine telegraphy as it is capable of transmitting four times more rapidly than an ordinary cable.

W. D. Bancroft and R. P. Allen (*Journ. Phys. Chem.*, vol. 29, p. 364) have continued their interesting studies on Metallic Lustre, and find that when light of sufficient intensity seems to come from a single surface and there are suitable variations of intensity in space or time, metallic lustre is obtained. Substances such as solid dyes, potassium permanganate, etc., which show selective surface reflection are so opaque for the rays thus reflected that the light comes practically from a single surface.

H. Alterthum, W. Fehse, and M. Pirani discussed the Melting Point of Carbon in the *Zeitschrift der Electrochemie* (vol. 31, p. 313). They applied their method for the determination of the melting point of difficultly fusible metals to the melting point of graphite. The graphite in the form of a rod 140 mm. long and 37 mm. diameter, broadened at each end and with a hole (18 mm. deep and 3 mm. diameter) bored at an angle to the axis of the rod is surrounded by a water-cooled jacket through which hydrogen at 800 mm. pressure is passed and is heated by an alternating current (8000 amperes and 9 volts). The melting point was found to be 3760° absolute  $\pm 65^\circ$ , a value in good agreement with other determinations.

J. K. Hunt and F. Daniels made a study of the Rate of Decomposition of Nitrogen Peroxide at Low Concentrations. They discussed critically in a paper in the *Journal of the American Chemical Society* (vol. 47, p. 1602) the various theories put forward to explain unimolecular reactions. They showed the decomposition of nitrogen peroxide is unimolecular, and they determined the rate of decomposition at 35°, 45°, and 55° at pressures ranging from 280 to 0.01 mm. The specific rate of reaction is independent of concentration over the range investigated and is not influenced by nitrogen dioxide or by the presence of a large excess of nitrogen.

The Selective Photo-elective Effect on Strontium was studied by R. Döpel (*Zeit. Physik*, vol. 33, p. 237) who found that when strontium was deposited as a mirror on glass by distillation and full precautions taken to exclude any hydrogen or moisture, the maximum photo current was produced at 350 $\mu$  which is distinctly shorter than that for barium, and also it showed the characteristic change with the angle of incidence of the plane of polarized light.

According to R. C. Burt who has made a study of the preparation of Sodium by Electrolysis through Glass (*Journ. Opt. Soc. Amer.*, vol. 11, p. 87), it is possible to introduce pure metallic sodium into the high vacuum of an electric light bulb by using the thermionic emission from the filament. The exterior of

the bulb is partly immersed in a bath of molten sodium nitrate, between which and the filament a potential difference is maintained the filament being negative. Currents up to 0.3 ampere may be passed through the glass, and .03 grams of sodium per hour deposited in the bulb. Sodium lamps may be prepared this way giving a sodium spectrum free from impurity lines, even those of potassium. Ions other than those of sodium will not pass through the glass, and if potassium nitrate or lithium nitrate is substituted in the bath of molten salt, the bulb breaks after passage of a current for a short period.

**MINERALOGICAL CHEMISTRY.** This division of chemistry deals more particularly with the composition of the earth's surface, and especially of minerals and rocks.

Scientific work bearing on the relation of the chemical nature of the earth's surface to the interior continues to be carried on in the geophysical laboratory of the Carnegie Institution of Washington. One of their experts, H. S. Washington, has devoted much attention to the Radial Distribution of Certain Elements in the Earth. His studies seem to show that the central core of the earth is composed of nickel-iron which gradually merges into a shell of silicates. Orthosilicates lie nearest the centre, but silicification increases towards the surface so that metasilicates, alkali polysilicates, and pure silica are obtained. Iron and magnesium increase at first from the border of the nickel-iron core until they reach a maximum in the metal-free shell composed chiefly of olivine and pyroxene. Above this they decrease steadily until they are almost negligible in the granitic upper part of the crust. As regards the relative progression of calcium, sodium, and potassium, calcium begins to appear near the core with very little sodium and no potassium. It reaches a maximum and then falls off toward the surface, whilst sodium becomes more important and potassium finally appears about the middle of the crusted shell and gradually becomes more abundant than sodium. The elements in the order of abundance which makes up 98.6 per cent of the earth's crust are: oxygen, silicon, aluminum, calcium, sodium, potassium, and magnesium. The earth as a whole is composed chiefly of seven elements which in the order of their abundance are iron, oxygen, silicon, magnesium, nickel, calcium, and aluminum.

The new minerals include:

**Dumontite** is a new radioactive mineral which occurs in pockets of the compact torbenite of Chinkolobwe in the Belgian Congo. According to A. Schoep who first described it, its composition corresponds to the formula  $2\text{PbO} \cdot 3\text{UO}_3 \cdot \text{P}_2\text{O}_5 \cdot 5\text{H}_2\text{O}$ . A description of a new vanadium mineral from Sincos, Peru, is published by W. T. Schaller of the U. S. Geological Survey. It is called *sincosite* and has a composition corresponding to the formula,  $\text{V}_2\text{O}_5 \cdot \text{CaO} \cdot \text{P}_2\text{O}_5 \cdot \text{H}_2\text{O}$ . Another new mineral is *dussertite* which comes from Djebel Debar Mountain, Algeria. It is described by J. Barthony as an arsenical mineral similar to arsenocsiderite with a composition shown by the formula  $[\text{AsO}_4]_2 (\text{FeAl})_2 (\text{Ca Mg})_2 [\text{OH}]_2$ . A Schoep who has devoted so much attention to the analysis of radium minerals, especially those from the Belgian Congo has described *sklodowskite*, a new uranium mineral and its relation to uranotile. He finds that *sklodowskite* has a composition that agrees

closely to the formula  $\text{MgO} \cdot 2\text{UO}_3 \cdot 2\text{SiO}_2 \cdot 7\text{H}_2\text{O}$  and it is therefore the magnesium analogue of uranotile. J. Parry and F. E. Wright report a new hydrous calcium silicate consisting of clear colorless crystals from Kimberley, South Africa, to which they have given the name *afwillite*. Its composition is indicated by the formula  $3\text{CaO} \cdot 2\text{SiO}_2 \cdot 3\text{H}_2\text{O}$ . A Lead Sulphobismuthite of Volcanic Origin, for which the name *Cannizzarite* has been proposed, was found in the fumaroles in Vulcano of the Lipari Island. It is crystalline and has a composition corresponding to the formula  $\text{PbS} \cdot 2\text{Bi}_2\text{S}_3$ .

**ORGANIC CHEMISTRY.** This branch of chemistry continued to be the most attractive to students, and the number of researches that were published far exceed those of any other department of chemistry. Among the many investigations published during the year the following have been chosen as illustrating the development of organic chemistry.

The Compagnie Nationale de Matières Colorantes et de Produits Chimiques obtained a British Patent (No. 208721) for the preparation of perylene. According to the specifications perylene is obtained by distilling a mixture of *beta* dinaphthol or its phosphoric or chlorophosphoric esters with a metallic salt, as for instance, zinc dust or reduced iron. The reaction may take place in the presence of water vapor in the case of *beta* dinaphthol itself, or of an inert or reducing gas, as for instance, hydrogen.

In the *Journal of the Society of Chemical Industry* (vol. 43, p. 346) G. T. Morgan and A. R. Bowen described their studies of the two Higher Fatty Acids: Eicosanoic and Stearic Acids. They find that hydrolysis of cocoa butter cannot be used as a method for obtaining eicosanoic acid, no acid higher than stearic being isolated. The graph showing the relationship between melting point and composition of mixtures of stearic acid and eicosanoic acids indicates the formation of a compound  $\text{C}_{18}\text{H}_{36}\text{O}_2 \cdot \text{C}_{26}\text{H}_{52}\text{O}_2$ . Mixtures of 50 per cent of each acid are inseparable by fractional distillation. A distinguished French chemist, G. Patart, described (*Comptes Rendus*, vol. 179, p. 1330) a method for the Synthesis of Methyl Alcohol by Reduction of Carbon Monoxide as follows: Gas containing 1 volume of carbon monoxide to 1.5-2 volumes of hydrogen is circulated over zinc oxide at 400-420  $^\circ\text{C}$ ./150-200 atmospheres; the liquid obtained in cooling part of the circuit to 20 $^\circ$  consists almost entirely of water and methyl alcohol.

In the *Journal of the London Chemical Society* (vol. 125, p. 215) B. D. Shaw discussed the Fission of the Pyridine Nucleus during Reduction. He finds that pyridine is reduced by sodium and alcohol first to 1:4 dihydropyridine is confined by the formation of glutardialdoxime with a melting point of 175 $^\circ\text{C}$ ., in good yield when hydroxylamine hydrochloride is added to the reduction liquor and the solution boiled for a few minutes. The pyridine is purified with permanganate and dried over calcium carbide; the alcohol is distilled through a column packed with calcium carbide. Amyl alcohol gives a slightly higher yield.

The separation of Proteoses Derived from Egg Albumen was investigated by G. V. Rudd who finds (*Austral. Journ. Exp. Biol. Med. Sci.*, vol. 1, p. 179) that the proteoses which result

from the peptic digestion of egg-albumen are divided into primary proteoses which are precipitated by half-saturation, and secondary proteoses precipitated by complete saturation with ammonium sulphate. The primary proteoses are subdivided into hetero-proteoses, insoluble, and proto-proteoses, soluble in water; the secondary proteoses into alpha-deutero-proteoses, insoluble, and beta-deutero-proteoses, soluble in alcohol of 67 per cent volume. The smallest fraction was that of the proto-proteoses.

Concerning the Preparation and Properties of Purified Oleic Acid and some of its Salts, A. Lapworth, L. K. Pearson, and E. N. Moltram stated (*Biochem. Journ.*, vol. 19, p. 7) that when olive oil is hydrolyzed with alcoholic sodium hydroxide and the resulting mixture is nearly neutralized with acetic acid; then treated with aqueous lead acetate and the lead precipitate dissolved in toluene; then the solution is further treated with dehydrated lead acetate; after filtering, the toluene solution is decomposed with hydrochloric acid, again filtered and the solvent removed by distillation, the resulting fatty acids are then fractionally distilled and the barium salt prepared from the middle fraction. After several recrystallizations from a mixture of toluene and amyl alcohol, the salt is decomposed. The oleic acid thus obtained contains 2 per cent of palmitic acid and small quantities of impurities. The latter can, however be removed by draining on a porous plate in a vacuum. The properties of this pure preparation are given.

From the Philippine Islands there came a paper on the Essential Oil of Calantas Wood in which W. L. Brooke (*Philippine Journ. Sci.*, vol. 26, p. 1) gives the physical constants of the odoriferous essential oil of calantas wood which botanically is *Toona calantas* and in which paper the author also shows that cardinene is one of its principal constituents.

In the *Comptes Rendus* (vol. 180, p. 926) A. Couder described his investigations on the Action of Ammonia on Cyanamide. He finds that ammonia is energetically absorbed by cyanamide at the ordinary temperature to form a colorless liquid which appears to be a solution of cyanamide in liquid ammonia, from which crystals of dicyanodiamide are slowly deposited, the change to the dimeride being complete at 0 $^\circ$  in about 20 days. Various physical determinations demonstrate the absence of any polymerization in the fully prepared solution, yet if the ammonia be driven off the residue is dicyanodiamide. This is interpreted on the assumption that ammonia and cyanamide form a complex which dissociates irresistibly into ammonia and dicyanodiamide.

R. W. West during the year completed his study on the Reduction of Aromatic Nitro Compounds. He found (*Journ. Chem. Soc.*, vol. 127, p. 494) that reduction is effected by the addition of iron filings to a boiling solution of the nitro compound in methylated spirit and hydrochloric acid. The amino compound may be purified by steam distillation or isolated as its hydrochloride and it is claimed that the method gives good yields of pure products.

N. Weiderpass reported on the Esthonian Oil of Peppermint in a scientific publication from Dorpat, Esthonia, as follows: Esthonian peppermint, *Mentha peperita*, var. *alba* et *nigra* yields

an essential oil having  $d_{20}^{20}$  0.9086;  $[\alpha]_D^{20}$  -17.63°;  $N_D^{20}$  1.4584; saponification number 0.808; ester number 10.384; acetyl number 180.41. It contains total menthol 50.21 per cent, methone 17.21 per cent, l. and d. limonene cineole, and the methyl esters of valeric and acetic acids. The dry plant contains up to 0.5 per cent of oil.

"Rhamnicoside, a New Glucoside, the Source of China Green, found in the Bark of the Stem of Purgative Buckthorn," is the title of a paper by B. Bridel and C. Charaux that appeared in the *Comptes Rendus* (vol. 180, p. 1047). Their report showed that by extraction of the glucosidic complex with 90 per cent alcohol, rhamnicoside,  $C_{28}H_{30}O_{15} \cdot 4H_2O$ , is obtained as colorless needles having no definite melting point,  $\alpha_D$  -78.12° in alcohol at 70°. It is hydrolyzed by dilute sulphuric acid with production of equimolecular quantities of dextrose, xylose, and rhamnicogenol,  $C_{12}H_{12}O_6$ , while boiling water leaves the two sugars combined together as primeverose. The glucoside, heated with dilute aqueous sodium hydroxide yields a clear solution and colorless crystals, both of which are extremely sensitive to light which produces an intense violet color in the solution. Evaporation leaves a green residue, a still brighter color being obtainable by substituting calcium or barium for sodium hydroxide in the process. The solution and the residue have strong tinctorial properties, and it is clear that China green is derived from this glucoside. A list is given of the species of *Rhamnus* from which the glucoside is derived.

From the studies of S. Kato and O. Shinoda (*Mem. Coll. Sci. Kyoto*, vol. 7, p. 339) On the Spontaneous Decomposition of Lecithin, it appears that Ovolecithin undergoes spontaneous decomposition on long keeping. The fatty acids are gradually separated, leaving a substance rich in phosphorous and nitrogen but poor in carbon and hydrogen.

Yajaine, A New Alkaloid (*Journ. Soc. Chem. Industry*, vol. 44, p. 205) was obtained by A. M. Barriga Villalba from the plant known in the Putumayo and Caqueta river territories of Brazil as "Yaje." It contained 1.5 per cent of an alkaloid yajaine and 0.025 per cent of a secondary alkaloid yajenine. An acid yielding well-crystallized calcium salts is also present, together with coloring matter readily oxidized to a scarlet substance on exposure to air. The alkaloids are obtained by extraction with dilute hydrochloric acid and precipitation with calcium hydroxide, and extraction of the dried calcareous precipitate with alcohol. The more insoluble yajaine crystallizes out in oblique rhomboidal prisms with a melting point of 206°C and having a composition corresponding to the formula  $C_{14}H_{15}ON_2$ . Both the alkaloid and its salts are optically inactive. Both in human beings and in animals the alkaloid in small doses produces anaesthesia; larger doses in guinea-pigs produce convulsions and death, the toxic dose being about 0.2 gram to the kilogram body-weight.

Two Italian chemists D. Ganassini and U. Santi in answer to the question Does a Bismuth Cacodyl exist? reported (*Boll. Chim. Farm.*, vol. 64, p. 289) that when a mixture of bismuth trioxide with anhydrous sodium acetate is strongly heated, a gas results which contains bismuth, has an alliaceous odor, exhibits marked resistance towards physical and chemical agents,

and is very difficult to purify. Its chemical composition had not been determined, but it is probably a bismuth cacodyl or its oxide.

Among the discoveries of the year is Vasicine, An Alkaloid Present in *Adhatoda vasica* Nees, which J. N. Sen and T. P. Ghose announce in the *Journal of the Indian Chemical Society* (vol. 1, p. 315). They find that vasicine,  $C_{11}H_{13}ON_2$ , which is extracted from the leaves of *Adhatoda vasica* by means of alcohol or a mixture of ammonia and chloroform forms needles which have a melting point of 190-191°C., is optically inactive, and contains no methoxyl groups. It gives characteristic precipitates with the alkaloid reagents and these authors describe the following derivatives hydrochloride (+2H<sub>2</sub>O), melting point 204°; chloraurate  $B.HAuCl_4$ , orange; chloroplatinate yellowish-brown,  $B_2H_2PtCl_6$ ; hydriodide (+2H<sub>2</sub>O) melting point 195°; sulphate  $B_2H_2O$ ; methiodide, melting point 187°, which is converted by aqueous barium hydroxide into hydroxymethyl-vasicine, with a melting point of 100°C.

E. Späth and R. Seka who have restudied the Constitution of Tritopine, which was isolated by Kauder in 1891 in very small amounts from the minor alkaloids of opium, reported (*Berichte*, vol. 58, p. 1272) that it is identical with laudanidine. As the latter substance is closely related to laudanine these authors recommend that the name be retained and the term tritopine be removed from the literature.

The discovery of Argemone Oil was announced in the *Journal of the Indian Institute of Science* (sec. 8A, p. 29) by S. N. Iyer, J. J. Sudborough, and P. R. Ayyar. They found that by the extraction of the seeds of *Argemone mexicana* with light petroleum 29.4 per cent of a pale yellow oil was obtained. The refractive indices and iodine values of hardened samples of the oil are similar to those for the rape oils, but this is not due to the presence of acids such as behenic, lignoceric, or erucic, but to some hydroxy-acids. The completely hardened oil retains an acetyl value, whilst the acids or methyl esters from it have no acetyl value, so that the acetyl value of the oil, namely 39, may be attributed to the presence of hydroxyoleic acid and to diglycerides. The acids from the completely hardened oil are palmitic and stearic, whilst in the original oil are found in addition palmito-oleic, oleic, linoleic, linolenic, and ricinolenic acids. See PHYSICS; MINERALOGY.

**CHEMISTRY, INDUSTRIAL.** No startling event during 1925 marked the steady progress of the year in industrial chemistry. Conditions favorable to the advancement of the recently created chemical industries in the United States continued, and at the same time conditions were not unfavorable in Germany so that a conclusion as to whether the trend for supremacy was in America or abroad was not available at the end.

**ORGANIZATIONS.** The American Chemical Society held its spring meeting in Baltimore, Md., during April 6-11, under the presidency of James F. Norris. The registration showed that there were 1524 persons present. The section of Gas and Fuel Chemistry was advanced to the rank of a division. Ira Remsen, long Professor of Chemistry at the Johns Hopkins University, was nominated for honorary membership. The evening meetings dealt with discoveries in which the sciences of physics and chemistry had been closely associated. Robert W. Wood, Professor

of Experimental Physics at Johns Hopkins, told of the use of ultra-violet rays for transmission of signals by invisible light. C. H. Viol of the Standard Chemical Corporation of Pittsburgh described novel industrial applications of radium. C. F. Jenkins of the Jenkins Laboratories of Washington, D. C., presented new methods for the transmission of photographs by radio. There was a trip to the Aberdeen Arsenal, where the Army staged a demonstration of chemistry as applied to warfare. There was a reunion of all Johns Hopkins men in honor of Dr. Ira Remsen, founder of the Johns Hopkins Department of Chemistry. In March past President L. H. Baekeland sent a check for \$10,000 to the treasurer of the endowment fund of the Society in keeping with a pledge made by him "to contribute as many dollars as there are members who give at least \$1" for that purpose. The autumnal meeting was held in Los Angeles, Calif., during August 3-8. The registration reached almost 1000 and the titles of nearly 150 papers were on the programme. Evening addresses were made by Alexander Findley of the University of Aberdeen on "The Twilight Zone of Matter," and by W. R. Whitney of the General Electric Company on "Matter—Is there Anything in It?" This meeting was a specially entertaining one in consequence of the arrangements made for the members of the eastern States to visit places of interest both on the way out and on the way back.

The American Electrochemical Society held its spring meeting in Niagara Falls, N. Y., during April 23-25, and its autumnal meeting in Chattanooga, Tenn., during September 24-26. F. M. Becket was elected president at the April meeting.

The American Institute of Chemical Engineers held its spring meeting in Providence, R. I., during June 22-23, while its later meeting was held jointly with the British Institute of Chemical Engineers in Leeds, England, during July 13-16. Charles L. Reese was president during the year.

The 44th annual general meeting of the Society of Chemical Industry was held in Philosophical Hall, Leeds, England, during July 13-18 with Pres. W. J. U. Woolcock in the chair. During the year 407 new members were elected and the membership now stands at 4865 as compared with 4830 in 1924. The treasurer reported a deficit of about £725. Important symposiums on Coking Practice, and Smokeless Fuel were held during the meeting. The presidential address was on Dyestuffs. Mr. W. J. U. Woolcock was reelected president and London was chosen for the place of meeting in 1926.

The London Chemical Society held its annual meeting on March 25, and at that time the membership of the Society was reported as 3963 as against 3978 in 1923. The financial conditions showed decided improvement and £210 were given as the excess of income over expenditure. The President, William P. Wynne, delivered a retiring address on Universities as Centres of Chemical Research. As his successor, Arthur W. Crossley, director of research to the British Cotton Research Association, was chosen.

The sixth annual conference of the International Union of Pure and Applied Chemistry was held in Bucharest, Roumania, during June 22-25. There were more than 100 delegates present including Edward Bartow, Miss E. P. Carr, J. B.

Ekerley, G. Lansing, J. F. Norris, C. L. Parsons, W. A. Patrick, A. M. Patterson, A. Seidell, C. P. Smyth, and G. L. Wendt from America. Sir William Pope was the president. Reports of ten committees as follows: 1. The Reform of Biochemical Nomenclature; 2. Analytically Pure Reagents for Research; 3. Annual International Tables of Constants and Numerical Data on Chemistry, Physics, and Technology; 4. Solid Combustibles; 5. Liquid Combustibles; 6. Ceramic Products; 7. Bromatology; 8. Scientific and Industrial Property; 9. Industrial Hygiene; and 10. Nitrogen, were presented and discussed. The scientific sessions included a symposium on the Nitrogen Problem, and addresses on Auto-oxidation and Catalytic Phenomena, by Charles Moureu, and on The Relation between Chemical Constitution and Physiological Action, by Ernest Fourneau. The meeting place in 1926 will be Washington, D. C., and Ernest Cohen of Holland was elected president.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES. The tenth Exhibition of Chemical Industries was held in Grand Central Palace, New York City, September 29-October 4. The outstanding feature of the exposition was a Court of Chemical Achievement in which were shown those exhibits that furnish the strongest proof of the activity of chemical research in the United States. Various departments of the federal government were honored by selection, and some of their displays showed in detail the value of their research. The Department of Agriculture showed a miniature grain elevator which produced minute dust explosions. An inert gas was introduced and the electric sparks failed to cause explosions. Another display was sprayed rubber, recently developed after three years' experimentation. Through this process not only is there produced a stronger and cleaner rubber than heretofore has been known, but it permits the importation to the United States in tank steamers in its original form. There also was a series of exhibits under the head of Chemistry's Contribution to the Textile Industry, which showed the advance registered in the United States by artificial silk, known generally under the name of "rayon." In 1924 the domestic output alone reached 38,050,000 pounds, and new plants are under construction. The actual making of synthetic fibres which form the basis of artificial silk was shown among the novelties. A special course in practical chemical engineering was given. It was divided into two groups involving separate series of lectures and demonstrations. Section 1 was for students who were not familiar with the processes of chemical engineering, having completed only the theoretical portions of their course. The second section was for advanced and graduate students and for men in the industry who desire what might be termed a very brief postgraduate course. In addition to the foregoing addresses were given on The Application of Research to Industry by Arthur D. Little; Sources of Information for Chemists and Engineers, by H. E. Howe; Buying and Selling the Products of Chemistry, by William Haynes; and the American Chemical Industry of Today, by Charles H. Herty.

BENEFACCTIONS. Late in 1924 announcement was made of the probating of the will of Elizabeth Blee Frasch, widow of Herman Frasch, inventor of a process of mining sulphur by steam. After certain minor bequests, Mrs. Frasch di-

rected that the residue of her estate amounting to upwards of \$5,000,000 be held in trust by the United States Trust Company and the income be used for "research in the field of agricultural chemistry, with the hope of attaining results which shall be of practical benefit to the agricultural development of the United States." It was provided that the trustee after advising with the American Chemical Company select one or more incorporated institutions in the United States and pay the income to them on the condition that they agree that the money would be devoted to research in agricultural chemistry.

Of paramount importance was the statement made in February that a centre for fundamental chemical research in solving the problems of medicine and one of the greatest chemical educational institutions ever established was to be founded in Georgetown University, Washington, D. C., with an initial endowment of \$5,000,000 and as many more millions assured as are needed to carry on the work. The endowment fund will all be raised by the end of 1925, and the chemical-medical research plant is expected to be in operation within three years, directed by experts in organic, inorganic, and physical chemistry, pathology, bacteriology, pharmacology, and biochemistry, to whom associates in each line of endeavor were to be assigned. Under their guidance research fellows and graduate students engaged in the preliminary work of the investigations were to be afforded a rare training for a future career in the service of chemical medical research.

Of worthy consideration was the offer made by Dr. Herman A. Metz of New York City, who has promised \$100,000 for the discovery of a commercial formula for synthetic morphine, but with the condition that the discoverer must relinquish all rights to the formula and turn it over to the United States government, which would then permit manufacture of morphine for medicinal purposes under licenses and supervise its distribution. According to Dr. Metz poppies, from which opium is distilled, were grown chiefly in India. The British government maintained an opium monopoly through which the drug was sold to unofficial distributors. To preserve an open opium market England on occasion has made war, and it was this interest that caused her to block the International Opium Conference at Geneva. If morphine could be made in the laboratory more cheaply than it can be reduced from the poppy pod, poppy-growing would no longer be profitable, the British opium monopoly would disappear and a contentious issue of international politics would no longer exist.

**MEDALS.** The Grasselli medal awarded annually by the American section of the Society of Chemical Industry "for the paper presented before that section which offers the most useful suggestion in applied chemistry" was presented on Dec. 5, 1924, to B. D. Saklatwalla, general superintendent of the Vanadium Corporation of America, in recognition of his paper on Ferrous Alloys Resistant to Corrosion. On January 16 the Perkins medal of the American section of the Society of Chemical Industry awarded annually "to the chemist who has most distinguished himself by his service to Applied Chemistry" was given to Hugh Kelsea Moore, technical director of the Research Laboratory of the Brown Company, Berlin, N. H. The Chandler medal conferred from time to time on an eminent chemist

in recognition of his achievement in science was presented on February 13 to Edward Calvin Kendall, head of the chemical section of the Mayo Foundation for Medical Education and Research in the University of Minnesota. He delivered the lecture on The Influence of the Thyroid Gland on Oxidation in the Animal Organism. The Nichols medal given "for the research published during the current year which is most original and stimulative" by the American Chemical Society was on March 6 presented to Edward Curtis Franklin, Professor of Organic Chemistry in Stanford University. The Willard Gibbs medal of the Chicago Section of the American Chemical Society was given in 1925 to Moses Gomberg, Professor of Organic Chemistry at the University of Michigan, for his work on the conception of valence in organic chemistry. The Cannizzaro prize in chemistry of the Accademia dei Lincei of Rome was in 1925 given to Irving Langmuir of the Research department of the General Electric Company in Schenectady, N. Y. On July 14 the medal of the Society of Chemical Industry was conferred upon Walter F. Reid who advanced industrial chemistry by his studies of smokeless powder, linoleum, and cement.

**ACTIONS OF THE UNITED STATES ON GERMAN PATENTS.** This famous legal controversy which has been before the courts since the autumn of 1922 (See YEAR BOOK for 1924, p. 144) was at the close of the year before the Federal Circuit Court of Appeals for the Third Circuit in Philadelphia, Pa. On March 27 this court dismissed the suit of the government to recover from the Chemical Foundation, Inc., the seized German dye patents, copyrights, and trade marks sold to the foundation by the alien property custodian during the administration of President Wilson.

The patents and other rights, approximating about 5000, were sold to the foundation for \$250,000. The government not only contended that the price was inadequate, but that the sale was irregular, and the result of conspiracy on the part of certain officers of the government during the Wilson administration. The validity of certain acts of President Wilson, Frank L. Polk, counselor of the State Department, and other officers, was questioned, but the appellate tribunal affirmed the lower court in dismissing the complainant's contentions. In summing up the conspiracy charge the Court of Appeals said: "The government has insistently pressed its charge of conspiracy throughout the proceedings in the trial court and here on appeal. We have, therefore, kept the subject constantly before us in our study of the case and in our deliberations. It will be enough to say that we have found no evidence that sustains either the charge of conspiracy first made against representatives of the industry or the charge of conspiracy later made against officers and agents of the government."

Notwithstanding the government lost in both the District Court of Delaware and in the Circuit Court of Appeals on May 27, 1925, the government filed in the Supreme Court an appeal in its suit to recover German patents from the Chemical Foundation.

**CHROMIUM.** A process of chromium plating, producing wearing surfaces harder than any other known metal, with a finish having 20 times the life of nickel plate, has been perfected by Colin G. Fink of Columbia University, as announced in May. Next to the diamond, the

new plating will be the hardest substance in existence. Chromium has been used hitherto only as an addition to steel to produce an extremely hard alloy. The price of chromium varies from 60 cents to \$1 a pound, so that the new surface can be produced at a cost not much exceeding that of nickel plate. It will not rust nor tarnish.

**GOLD.** The announcement in July, 1924, by A. Miethe, a German chemist, of his discovery of a process by which it was possible to transmute mercury into gold, failed to arouse much interest among chemists owing to the prohibitive cost of the process. Nevertheless, the methods followed by Miethe were studied in the United States at the Kent chemical laboratory of the University of Chicago and elsewhere. In February it was publicly announced that H. Nagaoka of Japan had been successful in accomplishing a similar result. The process by him is as follows: By using a mercury lamp the anode of which is exposed in air for more than 200 hours, under the electromotive force of 226 volts, there was obtained about 0.5 gram of soot, from which one milligram of gold was isolated. A white metal was found in the soot which is supposed to belong to the platinum group. The method by which he succeeded in obtaining gold from mercury is similar to that used in the United States and Germany to accomplish the same result. Dr. Nagaoka, who visited the United States in June, said that he was skeptical about the reports that Miethe had obtained gold from quicksilver. He said that the amount of electricity used by Dr. Miethe was not sufficient to break down the mercury atom into gold, and that he suspected the gold to be a contamination. It might have come from the quicksilver, it might have come from the silica glass used in the experiment, or it might have come from the carbon electrode. He said: "I do not believe it was the result of any changes in atoms."

In August reports from Germany said that by the improved process, electrical discharges are sent between mercury electrodes in a dielectric, like paraffin. The gold is found in the mercury atomized in the spark path in the ratio of 1 part of gold to 10,000 parts of mercury. From 1 kilogram of mercury  $\frac{1}{40}$  of a gram of gold can be obtained. Virtually all the quicksilver is recovered and is used over and over again. Watching Professor Nagaoka at Tokio, who discovered the gold-producing process independently of German savants, Professor Haber is quoted as saying that he has confirmed the results by repeating the experiment himself. In the autumn in consequence of experiments made at the New York University, it was announced that they had resulted "in a complete failure to confirm the transmutation of mercury into gold, as announced by Professor Miethe."

**MOLYBDENUM.** The improvement in the market during 1924 for this metal has resulted in the resumption of operations in the Kvina Molybdenum Mines, Christianssand, Norway. These mines have been idle for five years because of slight demand. Repairs were begun on the property in 1924, and during the present year work was resumed in the mines. The Knaben Molybdenum Mines, another Norwegian mining property which suspended operations, also began work during the year.

**PLATINUM.** The discovery of what is believed to be the richest platinum mine in the world was made in the summer near Johannesburg,

Transvaal, South Africa. It appears that an old prospector was sent out to the region which is 200 miles from Rand Reef, where gold mines are, with instructions to mine for tin. He mined for a long time unsuccessfully; for every time he panned he found a white substance which he threw away. At last the substance occurred so persistently that it was taken to an assayer who declared it to be platinum. Geologists who have been over the mine agree that it is the largest platinum deposit in the world and as the cost of platinum which came from Russia previously was due to its extreme scarcity, the price in the future will probably be materially reduced.

**POTASSIUM.** Official information reached Washington on March 20, indicating that French and German potash interests had entered into an agreement as to both markets and price levels. But it was not until May 7 that these countries signed the agreement covering the potash industries in the two countries. A new feature of this agreement is that the contracting parties, instead of maintaining the prices which have been asked, will lower prices in order to stimulate the existing markets and open new markets for the Franco-German potashes. It will be remembered that the French potash industry is entirely Alsatian and the accord practically reestablishes the pre-war monopoly of the Kali-syndicat, which monopoly now is shared by France and Germany to their mutual satisfaction. Potash concerns are among the very few German industries that have not suffered materially as a result of the post-war financial and industrial crises. During the first six months of 1925 the amount of potash sold by the German industries amounted to 730,000 tons, which is almost three times the amount disposed of during the same period of 1924 and also represents a vast increase over the total of 520,000 tons of the pre-war record year 1913. Every ounce of the stock left over from last winter has been sold, and all the concerns to-day are working at full blast. This showing of the German potash business is regarded as quite remarkable in view of the fact that Germany's world monopoly of the business suddenly was broken by the loss of the Alsatian mines in France, followed by the discovery of promising potash deposits in Texas, Spain, Galicia, the Balkans, Mexico, and elsewhere.

**RADIUM.** Announcement was made in March that the experts of Middlesex Hospital, London, England, had devised an improvement making it possible to increase the curative value of any given quantity of radium many thousands of times. The discovery consists in bottling radium gas known as radon, in tiny glass tubes. Radium emits three kinds of rays, known as alpha, beta, and gamma, but hitherto only the gamma rays have been harnessed. The present success concerns the beta rays, which the experts now are capturing, purifying, condensing, and confining in glass tubes a little thicker than a human hair, to which the name "seeds" is given. These beta rays, which have a profound effect upon the tissues of the body, hitherto have run to waste, but now, bottled, they can be used in conjunction with the gamma rays, and it is from this use that greater results are expected. The alpha rays are very weak and are regarded as negligible. While radon is the most expensive substance in the world, it is found that \$25 to \$50 worth can be used to treat conditions which

would require the application of from \$2000 to \$4000 worth of radium. Radon has the disadvantage, however, of short life, losing half of its activity in about four days, half of the remainder in the next four days and so on, whereas radium decays to the extent of only half of its weight in 1700 years.

**BROMINE.** It was announced in March by the American Chemical Society that a 4000-ton floating chemical plant would leave Delaware, April 13, to extract bromine from the ocean. It was estimated by experts of the Society that there was one pound of bromine in every 1700 gallons of sea water. The Atlantic Ocean will be used as a reservoir of bromine because other sources are insufficient for the demand. The ship will draw aboard and discharge sea water at the rate of 7000 gallons a minute. If the venture is successful it will revolutionize bromine production. This commodity has previously been obtained by laborious processes from mineral springs and potash deposits in Germany. Bromine is used in ethyl gasoline, motion picture photography, medicine, and elsewhere.

**HELIUM.** Tests conducted at the Bureau of Mines experiment station in Pittsburgh, Pa., during the year show that helium when mixed with oxygen forms a respirable atmosphere similar to normal air, and indicate that the use of the helium-oxygen mixtures are likely to find a new and important use in diving and tunneling activities. The mixtures reduce the time of decompression, the process by which divers and compressed-air workers are restored to normal conditions after finishing their work. As a consequence, the hazard of compressed-air illness or caisson disease, to which tunnel workers and divers are peculiarly subject, is greatly minimized. Helium not only has the advantage of being less soluble than nitrogen, but also diffuses more rapidly in the body fluids and tissues, resulting in rapid elimination of the gas from the tissues during decompression, and minimizing the risk of formation of the dangerous bubbles. The substitution of helium for the nitrogen ordinarily present in normal air has been found to result in an atmosphere which is as breathable as that provided by nature.

**SILICON STEEL.** According to Sir Robert Hadfield the use of silicon steel has saved more than enough money to build the Panama Canal, and is now eliminating an annual wastage of more than 5,000,000 tons of coal. This alloy invented early in the century was given the name of "low hysteresis steel" and in a technical description published by the Engineering Foundation in England the inventor says: "Magnetic hysteresis is the tendency of magnetic materials to persist in any magnetic state which already exists. It leads to loss of energy, which appears as heat when the magnetic state of the object is changed. This and other losses are greatly reduced by silicon steel. The first experimental transformer made with silicon steel in 1903 weighed 30 pounds. The first one made for service has been in successful use in Sheffield, England, since 1905. Its core weighs 830 pounds; if made of the best transformer iron then available, it would have weighed 1120 pounds and its electrical energy losses would have been more than one-third greater at the beginning. With silicon steel, the losses continued to decrease until they were much less than one-half what they would have been with the iron. With the iron core the losses would have increased, at least for

a time. Electrical manufacturers now regularly make transformers, the larger ones of which each contain thousands of pounds of this steel."

**MOTOR FUEL.** In France persistent efforts were being made to produce an artificial gasoline and at Creil a laboratory has been established where experiments are conducted on an industrial scale under the direction of Daniel Berthelot. The most promising of the processes under investigation is that mentioned last year (*YEAR BOOK*, p. 147) the basis of which is the manufacture of gas from the action of water on coke, which releases hydrogen and carbonic oxide as the first phase. The second phase, by hydrogenation, gives methane or marsh gas. The methane is converted into acetylene, which in turn is converted by catalysis into liquid hydrocarbon, that is to say, gasoline. Molasses has again been advised as a base for a new motor fuel, and an alcohol-ether product to displace gasoline is the recommendation of E. C. Freeland. He says: Ether is very volatile, has a high vapor pressure, an extremely wide range of explosive mixture with air and burns with no solid product of combustion. A fuel mixture from molasses can be successfully used in gasoline engines, giving great power, feed, and flexibility, combined with smoothness of operation and ease in starting. In Philadelphia a new motor fuel designed to meet the high compression type of motors was being investigated in July. The new substance was described as more volatile than gasoline and without the detonation of explosion. The nature of the fuel makes it impractical for all filling stations at once, but special equipment is being installed in a number of garages.

A new liquid motor fuel, called carbonan has been invented by a Russian engineer named Makhonin. This fuel has attracted much interest in countries not producing oil since coal tar and the tar oils produced by the destructive distillation of wood and peat may be converted into a high-grade motor fuel. Coal tar is used as a raw material without any other treatment than separation of the benzene preceding it. Carbonan, which is not inflammable at ordinary temperature, can be used in explosion motors without changing the construction of the carburetors. A statement from the French navy where the fuel has been tried in submarine motors, declares that carbonan gives 10 to 15 per cent higher efficiency than benzene. Makhonin is of the opinion that it will show a still higher efficiency, about 40 per cent more than benzene, in a motor especially designed to suit the new fuel.

**ALCOHOL.** The question as to the value of alcohol as a food has again been discussed and Dr. F. G. Benedict, director of the Boston Nutrition Laboratory of the Carnegie Institution of Washington, has published a report in which he contends that among the clearly proved facts that further study is not likely to modify to any degree, is included the observation that alcohol in not too large doses—that is, about 72 grams daily—is oxidized in the human body, and the energy that it furnishes in its oxidation may contribute to keeping the body warm, to replacing other nutrients in the diet, and possibly to the performance of muscular work. It was found that seventy-two grams of alcohol, contributing 500 calories to the daily ration, are more completely burned than 500 calories supplied in the form of almost any

other substance, with the possible exception of pure sugar. This has been demonstrated clearly by actual measurements of the heat output of man inside a respiration calorimeter, first, when subsisting on an ordinary diet, not containing alcohol, and then under exactly the same experimental conditions when 500 calories of fat or carbohydrate, or both, were replaced by 500 calories of alcohol. This interpretation of alcohol as a food is, then, based on the demonstration that it can replace fat and carbohydrate in no small measure in the diet. However, there are two functions of food that cannot be filled by alcohol. It is highly improbable that alcohol becomes a part of organized tissue, and its exact function in the energy required for the performance of muscular work is by no means clear. We know that fat, carbohydrate, and protein do become a part of organized tissue and do contribute to the performance of muscular work.

According to Dr. Henry H. Rusby, Dean of the College of Pharmacy of Columbia University: Men can do more work under the influence of alcohol, but they cannot do it as well. It reduces fear but does not give courage. The moderate use of beer is probably better justified than that of any other beverage except water. Beer is taken largely for the carbon dioxide gas and the stomachic and digestive properties of hops and malt.

**SYNTHETIC METHANOL.** This product originally produced in Germany in 1913 failed to make any impression on the American wood distillation industry until early in 1925 when the imports from Germany made it possible to sell that product for a little more than half the price of the American wood alcohol. According to information from Europe the technology of the German process was analogous to that of the Haber-Bosch ammonia process. Carbon monoxide gas and hydrogen are combined under pressure of 200 atmospheres and at a temperature around 400° C. in the presence of a catalyst, probably finely divided pure zinc oxide. In the same manner, ammonia is synthesized by the Haber-Bosch process at a pressure of 200 atmospheres and a temperature of around 600° in the presence of a catalyst (iron oxide activated with calcium oxide). The chemical engineering involved in both processes is the important factor. Information from official sources in Germany showed that 578 metric tons of methanol were exported from that country to the United States during the first five months of the year. In April Secretary Hoover was quoted as saying: "That an American industry was threatened, but that six American manufacturing groups were hurriedly endeavoring to change over processes and acquire necessary rights for the manufacture of the new product."

In August it was announced that a young chemist connected with the U. S. Tariff Commission had discovered among the seized German patents, now owned by the Chemical Foundation, one known as Patent No. 1201850 which was filed with the Patent Office in Washington on Feb. 11, 1914, by Alwin Mittasch and Christian Schneider, representing the Badische Anilin and Soda Fabrik Corporation of Ludwigshafen-on-the-Rhine, Germany. This patent was one of 13 filed at various times between June 10, 1912, and June 14, 1914. All were interrelated, but none by itself seemed of importance. Scattered through the thousands of patents in the Patent

Office, they attracted little attention. The patents themselves were granted at later dates, "twelve-o-eighteen-fifty," as the key patent is commonly called, being granted Oct. 17, 1916, just before the United States entered the World War. It is understood that the du Pont Company, which obtained a license to produce under the seized German patent, began operations in a plant at Clinchfield, W. Va., but abandoned that intention and is erecting a "pilot" factory at Charleston, W. Va., for the manufacture of synthetic methanol.

According to *Industrial and Engineering Chemistry*, the production of synthetic methanol in Germany was calculated at about 1000 tons monthly, and the Oppau plant was to go on a commercial production basis. By autumn it was expected that production would reach 2000 tons monthly, making an estimated total in 1925 of 15,000 tons. Of this, at least one-third will be used by the Interessen Gemeinschaft and the reduced cost of this raw material will give them an advantage in the cost of producing methyl dyestuffs. It was claimed that the production costs are now about 13 per cent of the cost of methanol by the wood distillation process. Indeed it was said that at one plant the cost had been reduced to 3 cents per kilogram. Fifteen thousand tons of methanol is equal to 5,000,000 gallons or more than half the amount of methanol produced in this country now by wood distillation. With the increased German production of 2000 tons a month, the production in 1926 should be 8,000,000 gallons, which is more than the United States produces now by wood distillation. It is probable that in 1926 the Germans will be obliged to compete with synthetic methanol produced in this country, as the du Pont Company expects to be able to make it.

According to Prof. Reid Hunt of the Medical School of Harvard University, German methanol which was being imported in such quantities as to arouse fear that America's \$100,000,000 wood distillation industry would be wiped out, was dangerous to life. He says: It can confidently be predicted that the use of synthetic methanol as a beverage or as an adulterant will be followed by the same disastrous effects to life and vision as have characterized such uses of wood alcohol. Those who were circulating the report that the synthetic methanol was not poisonous were not only stating an untruth but were assuming a grave responsibility, for death or blindness will inevitably be the fate of a number of those who might be misled by such statements and attempt to use synthetic methanol as a beverage.

**PURIFICATION OF ILLUMINATING GAS.** The removal of hydrogen sulphide from city gas is required by law in nearly every State and municipality and as the purification of gas by iron oxide is a somewhat complex problem, the Bureau of Mines made a study of conditions affecting the activity of iron oxides in removing hydrogen sulphide from gas. The report issued in February shows that several tests have been devised for estimating the purifying value of iron oxides from the amount of hydrogen sulphide that they are capable of decomposing under certain prescribed conditions. In some tests the sulphiding of the oxide is intensive, making necessary the use of pure hydrogen sulphide. In other tests the sulphiding is much slower, the content of hydrogen sulphide being the same as in practical operation, but the rate of gas flow

much higher. Although the work described, the result of a cooperative arrangement between the Bureau of Mines, the Illinois State Geological Survey, and the Engineering Experiment Station of the University of Illinois, demonstrates the effects of certain conditions in oxide activity, the authors do not claim that their method will definitely indicate the ultimate value of a fresh sample of an unknown material. Activity is changeable and is affected by many conditions. The method can be used to compare the activity of one material with the activity of another at the time of testing.

**DANGEROUS GASOLINE.** In consequence of several deaths ascribed to the poisonous nature of tetra-ethyl gasoline, that substance was subjected to examination by various chemists, notably those of Columbia University, a report by whom was submitted to the surgeon-general of the U. S. Public Health Service. As a result on May 5 the Ethyl Gasoline Corporation announced that it would suspend indefinitely deliveries of tetra-ethyl lead for resale to the public in ethylized gasoline. Deliveries to the United States government and to foreign governments and for research and experimental purposes were not to be affected by this action. By way of explanation it was said that the ethyl gasoline business is not an ordinary commercial enterprise conducted in the expectation of a present profit. Rather it is, and has been, and for a long time to come must necessarily be operated at a loss. The effort to discover a commercial method of increasing the efficiency of motor fuel and at the same time of conserving the supply of gasoline has engaged the study of scientists for years. The discovery that an admixture of a minute proportion of tetra-ethyl lead with gasoline would accomplish these results constituted a most important economic development, and was recognized as one of the outstanding achievements of this decade. Later it was claimed that chemical industries "can scarcely afford to sit idly by and view with equanimity the casual manner in which the fortunes of one of its branches have been rudely thrown into the balance by the hysteria of a newspaper and a physiologist. Whatever the merits or demerits of tetra-ethyl lead and ethylized gasoline, the products should not be summarily condemned as a menace to health, nor should the manufacturers be pilloried as inconscient profiteers without a thoroughgoing investigation." Accordingly a conference was called in Washington on May 20 by Surg.-Gen. Hugh S. Cumming of the Public Health Service to include physicians, pathologists, representatives of the automobile industry, and chemists. Meanwhile, Dr. H. Zangger of the University of Zurich charged that American gasoline, now almost universally employed in Europe in motor cars and lorries, was poisoning Continental cities. He said that he had analyzed street dust in Zurich and found it impregnated with tetra-ethyl lead which had been thrown out by motors into the air and had settled upon the ground. He estimated that thousands of pounds of this dangerous dust of lead oxides were deposited yearly in the principal streets of Zurich and other European cities to menace public health, as the metal dust directly attacks the nervous system. It is not only breathed in by pedestrians, but also enters their pores.

**PREVENTION OF FIRES.** Dr. Charles L. Jones of the Mellon Institute of Industrial Research

perfected a method of extinguishing fires with carbon dioxide in the form of snowflakes which would be particularly effective with fires in enclosed spaces, such as mines, ships, etc. His method was as follows: When liquefied carbon dioxide is passed from cylinder pressure to atmospheric pressure the liquid boils, its latent heat of vaporization being supplied by the cooling of the gas and the residual liquid until the liquid is solidified to snow. The snow continues to sublime until its vapor pressure becomes equal to atmospheric pressure, after which further sublimation can take place only through the addition of heat from an external source. The temperature is then 110° F. When the carbon dioxide is employed at this temperature it carries in suspension very finely divided carbon dioxide snow, and the flame is literally chilled out of existence. The carbon dioxide causes no damage to surrounding objects as do water and chemicals.

**RESTORATION OF METALLIC ART OBJECTS.** An interesting application of chemistry to art was announced by the Metropolitan Museum of Art in New York City in April. The process consists of the application of well-known electrochemical principles. Faint electrical currents operating for centuries turn the metal into rust. By subjecting the corroded objects to a stronger electrical current of the opposite polarity this effect is reversed and shapes and designs emerge from the formless rust. It was developed by Colvin G. Fink of Columbia University who contends that the process is useful for authenticating genuine antiques as well as for exposing frauds. An object supposed to be an ancient bronze of a man on horseback was subjected to electro-chemical action; a green antique finish of copper carbonate and glue came off, revealing a toy lead soldier astride a horse. More than 600 objects of bronze, silver, and alloys have been successfully treated.

**NEW WOOD PRESERVATIVE.** Wolman salts is the name of a wood preservative which has recently been introduced into the United States for the preservation of wood wherever wood is subject to decay. This preservative consists essentially of sodium fluoride and cresols. They are deadly to the many kinds of fungus that cause wood to rot. They are soluble in water, while creosotes are soluble only in oil. This is important because the cells of wood fibre naturally take up and conduct water, but tend to repel oils. Thus it is possible to treat wood with Wolman salts in about one-fourth the time necessary for similar treatment with creosote. Yet so harmless are the salts to the wood itself that treated wood may be made up into furniture of good appearance. It is used about the same as creosote, but it is odorless, clean, leaves no stains, can be painted or varnished and costs only about one-fourth as much as creosote. It also renders wood extremely fire-resistant. The new material is already being used by several American railroads for tie preservation and for preserving the timber of which wooden freight cars are made; also for the impregnation of mine timbers and telephone poles. Wolman salts were first used in Germany nearly twenty years ago where railroad ties impregnated with Wolman salts have been in the ground more than ten years and on examination of several thousand such Wolmanized ties show that ten more years of service may still be expected of them.

**ANTISEPTICS.** New and apparently important

antiseptics continue to be announced. In March Dr. Veador Leonard of the Johns Hopkins School of Hygiene described the results obtained by him in the use of "hexylresorcinol" which is 50 times more potent than carbolic acid in its power to kill disease germs in the genito-urinary tract. Three types of germs, known best by their production of pus and irritation, staphylococcus, streptococcus, and bacillus coli have been combated successfully by the new antiseptic. As hexylresorcinol is an irritant to the stomach, it is put up in olive oil solution in a gelatinous capsule. It is administered after meals so as to mingle with the food and prevent contact with the bare stomach walls.

**CONCENTRATED INSULIN.** Dr. John J. Abel and Dr. E. M. K. Geiling of the Johns Hopkins University, in the course of studies conducted by them to determine the exact chemical nature of insulin, a recent remedy for diabetes, succeeded in isolating a highly concentrated form of insulin from the commercial product. Their report says: "Considering a milligram of insulin to be capable of yielding 12 units, for the dosage of rabbits—the animals with which the scientists experimented—we have been able to separate from commercial insulin four different fractions, only one of which contains the insulin in a highly concentrated form. This fraction, when tested on rabbits, is able to reduce the blood to the convulsive limit of 40 units or more to the milligram. This product, readily attainable in quantity, will now serve as the starting point for the further purification of insulin. It is more than probable that the impurities which it still contains are as inert as those which have been removed. Later we shall give the results of the various chemical methods which are now being employed by us for the further purification of this highly active Fraction LV. This is regarded by physicians as the first step toward the production of pure insulin. If this is obtained it will be possible, it is believed, to produce the drug synthetically, in a pure form rather than depending on an extract from the pancreatic glands of animals and without the mixture of other substances which have no helpful part in the treatment."

**SYNTHETIC COCAINE.** An interesting question has arisen in England concerning the legal status of this compound (YEAR BOOK for 1924, p. 150) which came on the market early in the year. The artificial article, tartrate of dextro-pseudo-cocaine, is a product of German research, and it has been a question whether its possession and distribution are subject to the Dangerous Drug acts passed to check addiction to morphine, cocaine, ecgonine, heroin and their respective salts, and medicinal opium and preparations thereof above a certain strength. These are the articles specified in the statute, which provides for the addition by Order in Council of any drug which "is or is likely to be productive if improperly used of ill effects substantially of the same character or nature as, or analogous to those produced by morphine or cocaine." Notwithstanding statements to the contrary, the German synthetic "cocaine" is not at present regarded as coming under the acts and within their control. The official view is that it is chemically distinct from cocaine and therefore cannot be treated as such, although in fact it is an isomer of cocaine; nor, pending further investigations, can it be added to the list of drugs enumerated

on the ground of producing like effects to cocaine. Hence the conclusion is reached that the character and effects of this new artificial anæsthetic must apparently be established more substantially before the provisions of the acts can be applied to it.

**SIMPLIFIED COLOR PHOTOGRAPHY.** An entirely new method of color photography was described before the French Academy of Sciences on July 20, by J. L. Breton as a discovery by G. Rousseau. Instead of the old method, requiring three separate films in the cameras, provided with red, blue, and yellow screens and conducting reverse operations in developing a single plate, M. Rousseau discovered that he could get better results by a single exposure of three super-imposed films and the development of a single plate. By placing three films one upon the other in the camera, M. Rousseau found that the first film registered blue and violet; the second film registered green; while yellow, orange, and red went through the first two films and registered on the third. The advantages of the new process are that the films give absolutely identical views and the time exposure has been reduced to one twenty-fifth of a second—much faster than with the color screens and three separate exposures.

**LEATHER.** A report was published in April by Arthur W. Thomas and Stuart B. Foster of the Chemical department of Columbia University giving the results of study on the destructive and preservative effects of neutral salts upon hide substance. They found that magnesium and sodium sulphates show very definite preservative action. Hide powder suspended in concentrated solution of these sulphates for 70 days showed but the slightest evidence of hydrolysis. This indicates that the substitution of sodium sulphate for common salt in the commercial salting of hides and skins would result in the saving of hide substance. Calcium chloride, it was found, is exceedingly destructive to hides, and the presence of it in the salt used for hide preservation must be avoided.

Other studies show that imperfections in leather caused by microorganisms will be greatly lessened as a result of the war on bacteria whose ravages produce freckle-like spots, stains, buffed effects, and two common defects, known as hog grain and pipy grain. One type of bacteria, it was found, results from one kind of bacteria gaining the upper hand. Another type of bacteria channels along the blood vessel system of the skin leaving a very costly type of damage known as veins. After tanning, the greatest damage is done by molds. When leather is kept in the damp state very long, molds begin to develop and produce spots and stains. Some types of black molds lodge themselves in the hair follicles and then spread out in chains throughout the entire leather. These studies give the tanner a clearer idea as to how to prevent damage from microorganisms.

**NEW SUGARS.** Although the announcement of a synthetic sugar derived by passing the ultra-violet ray through formaldehyde was made by E. C. C. Baly in 1924 (YEAR BOOK for 1924, p. 149) its cost of production has thus far proved too great to make it available for commercial competition. The experts of the U. S. Department of Agriculture have continued their studies and have described a new process which the researches by Dr. R. P. Jackson of the Bureau of Standards confirms, making possible the crystallization of sugar extracted from such veg-

etables as artichokes. Lack of a process for crystallizing sugar drawn from such plants has been the bar to their utilization for this purpose. Sugar derived by this process from the artichoke, which was said to promise the cheapest source for its production, is in the levulose form and is one and one-half times as sweet as the sugar from cane and the sugar beet. Its production promises to be simpler and cheaper than that from cane or beet sugar. Dr. W. J. Spillman of the Department of Agriculture said that the artichoke offered the greatest advantages both of cultivation and of refining in utilizing the new process. The fact that its cultivation is materially cheaper and the yield by the acre heavier than that of either the sugar beets or cane is in its favor.

**TRADE CONDITIONS IN THE UNITED STATES.** The production of dyes decreased to considerable extent in the United States during 1924. The United States Tariff Commission gave out on September 6 a statement showing that American manufacturers had made great improvements in their product, producing dyes of fastness never before attained in the domestic product. This report attributed the production decline of 27 per cent from 1923 to 1924, to decreased activity in domestic textile mills. The 1924 coal tar dye production by 78 firms was placed at 68,679,000, against 93,667,524 pounds for 1923. Sales of these dyes in 1924 totaled approximately 65,000,000 pounds valued at \$35,012,400. The notable progress made in the manufacture of many valuable dyes of high degree of fastness, the report said, resulted in more than 60 dyes being produced in 1924 which were not made in 1923. Manufacturers spent upward of \$2,000,000 during the year in research work which was more than was expended in any other industrial field for such purposes.

The foreign trade of the United States in chemicals and allied products showed favorable progress during the first six months of 1925. The aggregate values of the exports, \$74,678,000, and of the imports, \$113,552,000, were, respectively, 11 per cent and 15 per cent above the corresponding totals for January-June, 1924. Over half of the total imports consisted of necessary crude materials, such as fertilizers and fertilizer materials (which accounted for 41 per cent of the total imports), gums, resins, and balsams (14 per cent), and China wood oil (5 per cent). The only class to record a smaller volume of trade was the botanical group. Although the imports of chemicals during the second quarter of the year were nearly \$8,000,000 below the value for the first quarter, the exports were \$2,000,000 above the first quarter total.

**TRADE CONDITIONS IN GERMANY.** Among high spots in the general development of the German chemical industry, events within the Interessen Gemeinschaft or German dye cartel stand out most conspicuously, because of the great prominence of this trust in local and world markets. Slow progress is being made toward consolidation within the cartel having for its object specialization of production by the several members, merging of sales organizations both at home and abroad, and retrenchment in general, with a view to lowering costs. Sales agencies have already been merged in certain foreign countries, notably in Czecho-Slovakia, Belgium, and Holland, and the Agfa and the Bayer Com-

panies, have effected an agreement assigning the sales of Bayer-controlled photographic and perfumery production to the Agfa and Agfa pharmaceutical production to Bayer; but despite reports to the contrary, the fusion movement to create a so-called "supertrust" has not been completed as yet, and it is still a question as to what form this fusion ultimately will take. Negotiations between the Badische Aniline and Soda Fabrik, Ludwigshafen am Rhein, leading Interessen Gemeinschaft member, and the Norsk Hydro, controlling a hydroelectric plant on the Glommsfjord in Norway, for the joint operation of a nitrogen-fixation plant, have not yet been concluded; the reason for delay is not known. It is supposed that such an operation would be exploited for creating surplus export reserves of nitrates. It is estimated that Germany's available supplies of fixed nitrogen from the Haber-Bosch plants, calcium cyanamide units, and coke and gas plants were 75,000 metric tons more fixed nitrogen in the fertilizer year 1924-25 than were consumed by the soil. This corresponds to 375,000 tons in terms of ammonium sulphate, out of which Germany exported in the calendar year 1924 about 100,000 tons of ammonium sulphate. The Haber-Bosch process of nitrogen fixation and the much-discussed new synthetic methanol, or wood alcohol, process are the most revolutionary achievements of the chemical industry of this century. The Badische Aniline and Soda Fabrik owns and operates both. The same concern has to its credit the discovery of alizarin or Turkey red (1869) and artificial indigo (1897).

The announcement was made in October of the merging into one corporation of the Badische Aniline, Lucius and Bruning, Friedrich Bayer, Anilin Fabrikation Gesellschaft, Weller Termeer and the Griesheim Elektron. The present total capital of these concerns is 641,600,000 marks common shares and 4,500,000 marks preferred. The five last named corporations were absorbed by the Badische Aniline, which increased its own capital sufficiently to carry through an exchange of shares and then altered its title to "Farbenindustrie Aktiengesellschaft," with headquarters at Frankfurt-on-the-Main. The new organization will control the manufacture and distribution of practically all Germany's aniline dyes, nitrogen, pharmaceutical, and photographic products, and organic and inorganic chemical derivatives, as well as the artificial silk industry.

**TRADE CONDITIONS IN FRANCE AND ITALY.** From a report published in March descriptive of the developments in France and Italy, the following information is taken: Prospecting for petroleum is going on in France with the support of the government. While the borings in Auvergne, Bresse, and Landes have not given tangible results, an important deposit has been revealed in Herault. Prospecting has been undertaken in the lower Seine, between Rouen and Havre. The presence of petroleum in the soil of Gabian, near Beziers, has been known for many years. Among ancient pharmaceutical products the oil of Gabian was reputed to be a remedy for skin diseases. Recent borings in this vicinity yielded from 10 to 40 liters an hour at 100 meters depth, and on boring deeper the flow reached one ton an hour.

Pre-war figures of consumption and production again were reached in Italy. Italian tech-

nologists were of the unanimous opinion that the national agricultural requirement of nitrogen was between three and five times the actual consumption. For this reason the government encouraged the production of nitrogen and also granted subsidies to several plants to utilize the nitrogen content of national fuels in the central power gas plants of the Mond type.

**OBITUARY.** Conspicuous among the losses by death to American chemistry during the year were those of William Francis Hildebrand who died in Washington, D. C., on February 7, and Charles Frederick Chandler who died in West Hartford, Conn., on August 25. Both were members of the National Academy of Sciences and were past presidents of the American Chemical Society.

**BIBLIOGRAPHY.** A very important summary edited by Jean Gerard, entitled *Ten Years' Progress in Science and Industry, 1914-1924*, was announced for publication toward the close of 1925. Its contents were to include chapters as follows: 1. Introduction: Chemistry and Industry; 2. The Evolution of the Science; 3. Scientific and Technical Progress; 4. The Industrial Effort of France; 5. French Economic Equipment and Organization; and 6. France's Colonial Effort. Each of these chapters contained an introduction by some well-known authority.

**CHESAPEAKE AND OHIO CANAL.** See CANALS.

**CHESS.** Four international chess tournaments were held during 1925, the most important being the one contested at Moscow in December. The standing of the first ten at the completion of the tourney was: Bogoljubow won 15½ games, lost 4½; Lasker won 14, lost 6; Capablanca won 13½, lost 6½; Marshall won 12½, lost 7½; Tartakower won 12, lost 8; Torre won 12, lost 8; Reti won 11½, lost 8½; Romanowsky won 11½, lost 8½; Genewsky won 10½, lost 9½; Gruenfeld won 10½, lost 9½. The first international tournament of the year was held at Berlin in January and was won by Johner of Switzerland. This competition saw the last appearance of the great German master, Teichmann, whose death came on June 15. The next tourney took place at Paris in February, Alekhine being the victor and the same player also gained the honors at the Baden-Baden in April. With Alekhine absent, Niemzowitsch and Rubenstein tied for first place in the Marienbad tourney held in May. The principal tourney in the United States during 1925, was the annual Western championship in which Kupchik of New York was the winner. Hermann Helms won the New York State title. In collegiate circles New York University for the second year in succession captured the inter-collegiate championship. Harvard, Yale, Princeton and the United States Military Academy organized a new league in 1925, known as the "H. Y. P. W." Chess League.

**CHESTNUT BLIGHT.** See BOTANY under Plant Diseases.

**CHICAGO, UNIVERSITY OF.** An institution of higher learning at Chicago, Ill.; founded in 1891, largely through gifts of John D. Rockefeller, who continued to aid the university until 1910. The university is located on the Midway Plaisance of the Chicago South Park system between Jackson and Washington Parks. It occupies for educational purposes including the site of Yerkes Observatory at Williams Bay, Wisconsin, 170 acres of land. There are over

50 buildings used for educational purposes connected with the university. It is closely affiliated with the Presbyterian Hospital, the Children's Memorial Hospital, the Otho S. A. Sprague Memorial Institute, the Memorial Institute for Infectious Diseases Founded in Memory of John Rockefeller McCormick, and the Country Home for Convalescent Children.

The net total registration for the autumn quarter of 1925, exclusive of the home study department (8000) was 7855, distributed as follows: graduate school of arts, literature and science, 1245; undergraduate school of arts, literature and science, 2759; divinity school, 213; medical courses, 191; Rush Medical College, 282; law school, 336; school of education, 163; school of commerce and administration, 407; graduate school of social service administration, 90; university college, 2407. The summer quarter enrollment for 1925 was 6595. The total net registration for the year 1924-25 was 13,890. The number of members on the faculty above the rank of assistant in the autumn of 1925 was 572.

The total productive endowment of the university (September, 1925), was \$32,249,239.89, and its total resources, including buildings and land, approximated \$60,000,000. In 1925 John D. Rockefeller, Jr., gave \$1,000,000 to the university for additional endowment of the divinity school. Other large gifts were \$500,000 from the Wieboldt Foundation for a modern language building, and \$1,000,000 from Douglas Smith, as an endowment fund for medical research, the income to be used for the investigation of the causes, nature, prevention, and treatment of disease. In the autumn of 1925, the university was engaged in a campaign to secure \$17,500,000 for endowment and new buildings, and by October, 1925, had succeeded in procuring subscriptions for over \$6,000,000 of this amount. In the summer of 1925 work was begun on the construction of the Albert Merritt Billings Hospital. There was an endowment of approximately \$17,000,000, including that of the affiliated institutions, available for medical instruction and research. In October, 1925, construction was well under way for the university chapel with seating capacity of 2000 people, a divinity school chapel, a theology building, a laboratory for experimental zoölogy, and a group of buildings for the medical schools at a cost of \$8,000,000. In September, 1925, the library contained 717,153 volumes, and approximately 250,000 pamphlets. President, Max Mason, Ph.D.

**CHILD LABOR.** On January 27, it was announced that more than one-fourth of the States had failed to ratify the Federal Child Labor Amendment, and that, therefore, it was lost. The States refusing to ratify were: Massachusetts (by popular referendum), Georgia, Kansas, Louisiana, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Texas, and Washington. Possibly the most potent reason adduced—it was, in fact, the reason why such a liberal paper as the *New York World* opposed the amendment—was that the amendment was an unwarranted interference with States' rights. Objection was taken to the tendency in the United States to centralize power

in the hands of the Federal government, at the expense of the States, and by many the Amendment's defeat was regarded as a recoil against the hasty action that had brought about the Prohibition Amendment. Another important factor was to be found in the opposition of the agricultural groups who considered the age limit of 18 set by the amendment as altogether too high. Investigations, in fact, continued to show that a considerable part of the work annually done by those migrating laborers who followed the harvest seasons from the South to the North, was carried on by minors. According to the Federal Children's Bureau, this state of affairs appeared particularly true in the beet sugar fields.

President Green at the A. F. of L.'s convention in October stressed this point as well when he charged the farmers with defeating the Amendment. The Executive Council of the A. F. of L. had said in its report that the enforcement of State laws was gradually being weakened and that the number of children being exploited in industry was increasing amazingly. Commenting on this condition, and the fear that the Amendment might be lost irretrievably, Mr. Green said: "Vicious propagandists, such as chambers of commerce, so-called manufacturers' associations, hostile textile employers, and those who profited from exploitation of child labor, were to blame. These had particular effect upon farmers and they influenced many well meaning people." Farmers, it appears, had been told that the Amendment would prohibit the labor of their own sons and daughters around the farm and house unless they had reached the age of 18. This Mr. Green called "malicious misrepresentation." The amendment was merely an enabling act and Congress would have to pass legislation first before it could become operative.

The A. F. of L. put on record its decision to continue an unending fight for the ratification of the Amendment. The fact is, opinion seemed fairly agreed that the Amendment was not defeated because it was considered an unwarranted interference with the conduct of private industry. The day of unchecked *laissez-faire* is about over in the United States, and if anything, defeat must be attributed to political reasons rather than to economic. At any rate, it is certain that nobody regards this setback as defeat and that proponents will continue to wage the fight first in the States, and if unsuccessful, again before the Federal tribunal. Regulation will come ultimately and in view of the enormity of the evil it seemed puerile to argue that State control is more desirable than Federal supervision. So said the friends of the Amendment, and they were willing to chance the evils of bureaucracy to keep children out of the factories.

The National Child Labor Committee estimated that there were at least 2,000,000 children under 15 years of age who were being gainfully employed. Even this figure, by many authorities, was held to be too low. One writer, on the basis of child population and school attendance, declared that there were 3,000,000 children from 7 to 16 employed, and 5,841,961 children between the ages of 7 and 18, in some industry. The investigations of the Children's Bureau revealed the fact that children were working on farms under particularly trying conditions. In Virginia, on the truck farms, a survey showed that children worked for wages ranging from 5 to 20 cents an hour, and that these earnings "seemed a meagre return for the hours of labor, the

physical strain of constant stooping, the exposure to heat and dampness, and for many the loss of time in school, that the work entailed." Other investigations showed that children as young as six years were working in the beet fields of Colorado and Michigan and that "of the 1022 children studied 678 had cases of winged *scapulae*" as a result of "taxing the muscles of an underdeveloped shoulder girdle in this period of their growth." In the cotton fields of California children as young as four picked cotton from sunrise to sunset; here 15,000 children were reported as working at the harvest-time.

It is interesting to quote the Children's Bureau on the causes of Child Labor:

Poverty and ignorance are both causes and effect of child labor. Although a large proportion of the children who go to work as soon as the law allows give dissatisfaction with school as the direct cause, nevertheless it is chiefly in homes where poverty, past or present, has caused a low standard of living or ignorance of the value of education that this dissatisfaction results in the child's leaving school for work. Physical deterioration, moral defect, and industrial waste, as well as poverty, result from premature unemployment. While the enactment and the adequate enforcement of good child labor and compulsory school attendance laws are essential to the proper protection of children against industrial exploitation and loss of educational opportunity, adequate family incomes and an educational system satisfactorily adjusted to the needs of adolescent children are prerequisites to the solution of the child labor problem.

In all, the Federal amendment received action at the hands of 43 legislatures of the States. The following is the action taken for the year. In Arkansas, Arizona, California, and Wisconsin both houses ratified; in New Mexico, one house ratified. In Montana the house of representatives voted for the amendment and the senate against it. In 21 States both houses rejected the amendment. These were: Connecticut, Delaware, Florida, Georgia, Indiana, Kansas, Maine, Massachusetts, Minnesota, Missouri, New Hampshire, North Carolina, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, and West Virginia. In nine States, in addition to Montana, one house rejected, viz., Idaho, Louisiana, Michigan, Nebraska, Nevada, North Dakota, Ohio, Oklahoma, and Oregon. In Iowa and Wyoming one house in each voted to postpone action. It was reported that in Colorado, too, one house had voted against.

**STATE ACTION.** The Amendment, of course, was at the end of the year still legally pending and adverse action may be rescinded by future legislatures. That the fight was to go on no one doubted, as long as exploitation of children continued and the State authorities took only a lukewarm interest. The following summary, prepared by the Children's Bureau, reveals how little was done by State legislatures meeting over the year. It should be mentioned that 42 State legislatures met during 1925.

**Michigan.** Raised to 18 the age up to which employment certificates are required.

**New Mexico.** Changed the maximum working hours for children under 16 to an 8-hour day and a 44-hour week; prohibited night work from 7 P.M. to 7 A.M.; prohibited the work of children in dangerous or injurious occupations; provided for a child-labor inspector.

**New York.** Reduced from 48 to 44 hours the weekly labor of children under 16.

**Tennessee.** Required a physical examination for the granting of employment certificates to children under 16.

**Texas.** Provided an 8-hour day for children

under 15; prohibited the employment of children under 15 between the hours of 10 P.M. and 5 A.M.

*Wisconsin.* Empowered the State industrial commission to regulate the labor of children under 16 in cherry orchards, market gardening, gardening controlled by canning factories, and the culture of sugar beets and cranberries.

*Wyoming.* Prohibited the employment of children under 16 in a number of designated hazardous occupations.

In Delaware, Illinois, Massachusetts, New Hampshire, North Carolina, Rhode Island, bills for the purpose of strengthening the labor code as affecting children were defeated.

**STATE CONTROL.** An interesting commentary on the success of State control of child labor was to be found in the study of the Consumers' League of New York. Devoting itself to the question of the enforcement of the State labor law, and covering the period June 30, 1924-June 30, 1925, the League found that though in 90 per cent of the cases brought to court conviction resulted, the majority of the defendants received suspended sentences only. The fact was, the proportion of sentences suspended was highest in child-labor cases, where, in the three years studied, at least 50 per cent of the defendants were released. Said the League: "Suspended sentences in 50 per cent of the convictions is not rigid law enforcement even though a considerable number of the violations were first offenses."

#### CHILD WELFARE RESEARCH. See EDUCATION IN THE UNITED STATES.

**CHILE**, chē'lā. A south American republic lying on the western Pacific coast of the southern part of the continent, extending from Peru to the southernmost point. Capital, Santiago.

**AREA AND POPULATION.** The extreme length is 2628 miles and the average width is 177 miles. The population, according to the census of 1920, was 3,754,723. The republic is divided into 23 provinces, subdivided into 82 departments and one territory (Magallanes). The populations of the principal cities at the census of 1920 were: Santiago, 507,296; Valparaiso, 182,242; Concepcion, 64,074; Antofagasta, 51,531; Iquique, 37,421; Talca, 36,079. The urban population made up 46.6 per cent of the total. The great majority of the inhabitants are of European descent. In 1920, the foreigners numbered 115,763, as against 134,524 in 1917. The natives comprise the Fuegians, for the most part nomadic and living in the southern territories; the Changos, civilized and employed as laborers, in the coast region; and the Araucans, who live in the valleys and on the western slopes of the Andes and number about 101,118. The movement of population in 1924 was: Marriages, 28,261; births, 155,431; deaths, 120,415. The population was estimated on Dec. 1, 1924, at 3,905,358.

**EDUCATION.** Education is free and since Aug. 26, 1920, compulsory in the primary grades. In September, 1924, the number of public primary schools was 3271 with 392,183 pupils. In 1922 the teachers numbered 8779. In the same year there were 15 normal schools with 2391 pupils and 420 teachers; 165 private and 162 public secondary schools with 23,025 and 37,237 pupils, respectively. There are various schools of mines, professional schools, and other special institutions. For higher education there are: The University of Chile, belonging to the state, with

faculties of law and politics, theology, science, medicine, pharmacy, physical and mathematical sciences, philosophy, literature, and fine arts; the Catholic University; and two industrial universities situated at Valparaiso and Concepcion. Other noteworthy institutions are the Pedagogical Institute, the National Conservatory of Music, the National Observatory, etc. There are in addition various lyceums and colleges maintained in the provinces.

**PRODUCTIONS, MINERALS, ETC.** Agriculture and mining are the principal pursuits of the country. The agricultural zone lies in the centre of the country with an area under cultivation placed at 42,133,663 acres. The climate admits of the raising of tropical products as well as of those of the temperate zone. Cereals are the leading crops, of which wheat is the most important. According to the Chilean Central Office of Statistics, the figures for production of the 1924 crops were as follows: White wheat, 6,601,452 metric quintals; summer wheat, 389,081 metric quintals; rye, 20,298 metric quintals; barley, 1,141,227 metric quintals; chick-peas, 19,469 metric quintals; oats, 466,276 metric quintals; beans, 432,071 metric quintals; peas, 95,305 metric quintals; potatoes, 2,704,781 metric quintals; maize, 363,891 metric quintals; and wine, 2,366,092 hectoliters. Fruit growing has latterly increased and covers an area of about 20,000 hectares. On Jan. 1, 1924, the livestock of Chile comprised: Horses, 329,454; asses, 33,580; mules, 43,816; cattle, 1,995,538; sheep, 4,569,166; goats, 525,106; and pigs, 263,330.

As to minerals, Chile is the second largest producer of copper in the world. Other minerals obtained are gold, silver, cobalt, manganese, coal, nitrate, borate, salt, sulphur, guano, and iron ore. By far the most important item of commerce is nitrate of soda, which is found chiefly in the nitrate section of the desert of Atacama. The production of nitrate in 1923 was 1,903,527 metric tons. During the same year 2,263,914 metric tons were exported. The iron resources have not been developed but are reported to be of great value. The deposits are found in the provinces of Atacama and Coquimbo. The coal region lies to the south of Valparaiso.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, the foreign trade of Chile during 1924 amounted to 964,719,639 gold pesos. This total represents an increase of 98,198,911 gold pesos or 11.3 per cent over the trade of 1923, as well as indicating the greatest volume of trade for any year within the period 1921 to 1924 inclusive. Chile showed an increase in both exports and imports for the year 1924 over those of 1923. Exports for 1924 totaled 601,462,206 gold pesos as compared with 537,210,473 pesos during 1923, a gain of 64,251,733 pesos or 11.9 per cent over the previous year. The total imports for 1924 amounted to 363,257,433 gold pesos as compared with 329,310,655 pesos for 1923, an increase of 33,946,778 pesos or 10.3 per cent over the previous year. A favorable balance of trade for the year 1924 is indicated, with the excess of exports over imports amounting to 238,204,773 gold pesos, an increase of 30,305,355 pesos or 14.5 per cent over the favorable balance of 207,899,418 pesos for 1923. The accompanying table shows the general upward trend of Chile's international business for the period 1921 to 1924:

**FOREIGN TRADE OF CHILE**  
(In Chilean gold pesos<sup>a</sup>)

Year	Imports	Exports	Aggregate trade	Favorable trade balance
1921	381,302,506	433,758,629	815,061,135	52,456,123
1922	237,181,578	381,609,595	568,791,173	94,428,017
1923	329,310,655	537,210,073	866,520,728	207,899,418
1924	363,257,433	601,462,006	964,719,639	238,204,773

<sup>a</sup> 1 peso = \$0.365.

During 1924 the United States was Chile's largest supplier, having furnished 85,357,027 gold pesos' worth of imports; Great Britain occupied second place, having furnished 75,820,788 pesos of imports; Germany was third with 51,220,001 pesos; and Belgium fourth with 36,163,147 pesos. In the same period the United States was Chile's best customer, taking 250,704,783 gold pesos' worth of products; Chile's second best customer was Great Britain, with 189,060,433 pesos of exports; Germany was third with 37,055,875 pesos; and France fourth with 28,546,348 pesos. The purchases of the United States from Chile during 1924 amounted to 250,704,783 gold pesos, representing an increase of 3,801,984 pesos, or 1.5 per cent increase over the total of 246,902,799 pesos purchased during 1923. Great Britain took 135,012,913 gold pesos' worth of exports during 1923 as against 189,060,433 pesos in 1924, representing an increase of 54,047,520 pesos, or 40 per cent, for 1924. During 1924 Germany purchased from Chile merchandise to the value of 37,055,875 gold pesos, representing an increase of 12,498,849 pesos, or 50.8 per cent, over the total of 24,557,026 pesos imported during 1923. France bought 28,546,348 gold pesos' worth of products from Chile during 1924, representing an increase of 6,498,905 pesos, or 29 per cent, over the total of 22,049,443 pesos in 1923.

During 1924 Chile imported merchandise from the United States to the value of 85,357,027 gold pesos as compared with 87,832,941 pesos in 1923, representing a loss of 2,475,914 pesos, or 2.8 per cent, as compared with the year 1923. From Great Britain Chile obtained during 1924 merchandise valued at 75,820,788 gold pesos, representing a loss of 3,179,334 pesos, or 4 per cent, from the total of 79,000,122 pesos imported in 1923. Germany supplied to Chile 51,220,001 gold pesos' worth during 1924, which was an increase of 7,226,982 pesos or 16.4 per cent over the total of 43,993,019 pesos in 1923. Belgium, in 1923, supplied but 19,248,584 gold pesos' worth of merchandise to Chile, whereas in 1924 the total value was 36,163,147 pesos, or an increase of 16,914,563 pesos, which is 87.8 per cent.

**FINANCE.** Almost the first act of the new Government Council of Chile (see below under *History*) was to officially decree a revised 1925 budget, providing for an appreciable increase in both gold and paper expenditures. The former budget provided for expenditures of 414,381,300 paper pesos and 70,693,433 gold pesos. After the figures had been approved by the Government Council strong pressure was brought to bear by the various Departments which prompted the council not to decree this budget into law until further studies had been made. According to the United States Bureau of Foreign and Domestic Commerce the revised budget estimated the ordinary receipts at 138,597,000 gold pesos and 216,096,034 paper pesos, and extraordinary revenues at 12,566,648 gold pesos and 49,294,159 paper pesos. Details of ordinary and extraordinary receipts follow:

## GOLD

	Pesos
Ordinary receipts:	
Duty on nitrate .....	77,740,000
Iodine and borax .....	1,500,000
Consular charges .....	5,000,000
Lighthouses .....	750,000
Santiago water supply .....	700,000
Revenue from treasury .....	1,500,000
Interest on municipal loans .....	1,407,000
Import duties and warehousing, deducting 15 per cent in accordance with special laws .....	50,000,000
<b>Total .....</b>	<b>138,597,000</b>

Extraordinary receipts:	
Interest on State railway loans .....	8,866,648
Valparaiso port works (loan) .....	2,600,000
Constitution port works .....	1,000,000
<b>Total .....</b>	<b>12,566,648</b>

**Grand total .....** 151,163,648

## PAPER

Ordinary receipts:	
Frontier customhouses .....	5,000,000
Parcel post .....	5,000,000
Transportation of packages .....	3,000,000
Income from tax on transport .....	1,000,000
Stamp paper, seals, and postage stamps .....	16,000,000
Postal and telegraph services .....	11,000,000
Tobacco .....	14,000,000
Alcohol, wines, and beer .....	9,000,000
Inheritance tax .....	3,000,000
Sewerage .....	8,600,000
Insurance companies' tax .....	2,000,000
Sale of fiscal lands .....	500,000
Rental of lands in Magallanes .....	200,000
Auction lands in San Antonio .....	1,000,000
Debtors from auctions .....	200,000
Proceeds from National Mint .....	1,000,000
Drinking water and drainage service .....	5,024,690
Arica-La Paz Railway .....	12,571,345
Income from treasuries .....	12,000,000
Interest from Vales .....	2,000,000
Tax on playing cards .....	600,000
Income tax .....	100,000,000
Receipts from identification service .....	4,200,000
Operation of the Port of San Antonio .....	4,200,000
<b>Total .....</b>	<b>216,096,035</b>

Extraordinary receipts:	
15 per cent import tax (balance of 1924 authorized by Law No. 281) ..	11,887,059
15 per cent import tax (calculating 1925 in accordance with Law No. 281) .....	15,665,000
Valparaiso drinking water .....	3,244,540
Service of irrigation bonds .....	2,961,760
Service of bonds, Law 3624 .....	10,000,000
Service of bonds, Law 4041 .....	2,000,000
Roads personnel (from roads receipts) ..	735,800
Iquique drinking water .....	600,000
Dredging of Valdivia River .....	500,000
Amusement tax decreed by Law No. 77 ..	1,700,000
<b>Total .....</b>	<b>49,294,159</b>
<b>Grand total .....</b>	<b>265,390,194</b>

Authorized expenditures amounted to 472,680,110 paper pesos and 82,042,057 gold pesos, distributed to the different departments as follows:

Ministry	Paper pesos	Gold pesos
Interior .....	81,480,896	111,666
Foreign Affairs, Worship, and Colonization .....	4,451,875	2,389,980
Justice .....	20,688,752	.....
Public Instruction .....	85,529,645	66,550
Treasury .....	72,981,150	65,567,580
War .....	80,602,428	79,000
Navy .....	45,735,322	6,029,475
Roads and Public Works ..	47,287,605	7,609,184
Agriculture, Industry, and Colonization .....	12,074,182	74,534
Hygiene and Social Service ..	21,898,755	114,088
<b>Total .....</b>	<b>472,680,110</b>	<b>82,042,057</b>

Balancing the receipts against the expenditures, the government anticipated that there would be a surplus of 74,857 paper pesos at the end of 1925. This is shown in the accompanying summary:

		Pesos
Gold		
Receipts	.....	151,163,648
Expenditures	.....	82,042,057
Surplus	.....	69,121,591
Paper		
Receipts	.....	265,390,194
Balance of gold at premium of 200 per cent	.....	207,364,773
Total	.....	472,754,967
Expenditures	.....	472,680,110
Surplus	.....	74,857

**COMMUNICATIONS.** The railways of Chile aggregated 5481 miles in 1923, 2976 miles being government owned and 2505 privately owned. See preceding YEAR BOOK. During 1925 Chile had approximately 9480 kilometers of track in operation, of which 5840 kilometers were owned by the state and 3640 by private companies. The balance sheet of the state railway, as of Dec. 31, 1924, showed a profit of 5,352,898 paper pesos, or less than half the profits of 1923. During the year the Chilean government was authorized to contract loans with domestic or foreign banks to enable them to form a working fund to regulate the payments which they have to meet and also to secure resources for executing new work and particularly the transformation of stations with reinforcement of railway bridges.

**GOVERNMENT.** Executive power is exercised by the president elected for five years by indirect vote, and legislative power by the national congress composed of the senate and chamber of deputies, the former having 37 members elected by the people of the provinces for six years, and the latter 118 members, chosen directly by departments for three years. The ballot is limited to persons who can read and write. For the vicissitudes of President Arturo Alessandri and his government see the sections on *History* in this and preceding YEAR BOOK.

**HISTORY.** For a discussion of the Tacna-Arica dispute see article on **ARBITRATION, INTERNATIONAL**. As noted in the previous YEAR BOOK a *coup d'état* in September, 1924, had overthrown the government of Pres. Arturo Alessandri and compelled him to flee the country. The government fell into the hands of a military junta. This lasted until Jan. 23, 1925, when a group of army officers, dissatisfied with military rule, surrounded the government's headquarters and took over the reins of control. Two days later this new group known as the "Junta Gobierno" cabled to former president Alessandri, who was then in Italy, and invited him to return to Chile and resume his position as president. He made a careful survey of the situation and cabled his acceptance of the offer after the acceptance of the following provisions: the immediate formation of a non-partisan civil government; freedom to exercise full constitutional powers and the return of the military to their proper duties; the calling of a Constitutional Assembly to reform the constitution; and the approval by this assembly of new laws regu-

lating the election of the Chamber, Senate, and President. He stated that if these conditions were accepted he would return and form a stable government. "I want to establish the strongest relationships between Chile and foreign countries that have been obtained since the promulgation of the Monroe Doctrine." On January 29, Armando Jaramillo, the leader of the Liberals and friend of Alessandri formed the following cabinet: Interior, Armando Jaramillo; Foreign Affairs, J. G. Gormaz; Justice, J. Maza; Finance, V. Magallanes; War, Col. Ibáñez; Navy, Rear Admiral Bahamondes; Agriculture, C. Vicuña; Public Works, F. Mardones; Public Health, Dr. Salas. This government, while awaiting the return of the former president was compelled to declare martial law in some of the provinces because of mutinies among some of the military forces in opposition to the government and to the recall of Alessandri. On March 20, the exile returned home and upon the assumption of his duties as president the political and commercial conditions of the country became stabilized. A plebiscite was held on August 31 to decide on the new constitution which had been drawn up largely as a result of the demands of President Alessandri when he was in exile. The people voted overwhelmingly in favor of the new instrument and paved the way for an orderly election in October for the office of president.

President Alessandri resigned his position on October 1 and turned the presidential powers over to Señor Borgoño. This was a rather unusual result of a political disagreement, following a dispute with Colonel Ibáñez, the Minister of War. On September 30 the cabinet resigned in order to assure a free presidential election on October 24. Colonel Ibáñez refused, and, consequently, President Alessandri himself resigned. After a series of conferences the various political parties announced on October 5 that the choice for the presidency was Emiliano Figueroa Larraín, who had seen considerable public service in the legislative body and in various cabinet positions. When this action was taken Colonel Ibáñez withdrew his name as a candidate for the office. Larraín was elected with practically no opposition on October 24. Dr. José Salas, his only opponent, who was nominated by the laboring classes, polled about 70,000 votes as compared with about 172,000 for Larraín. Slight disorder followed the election because of the activities of the Salas faction who claimed fraud. On November 22 general elections were held for the legislature. Little change resulted in the political alignment of parties, the Liberals or Democrats retaining control of both houses. See **ARBITRATION, INTERNATIONAL**.

**CHINA.** A Far Eastern state forming the eastern part of Asia, on the Pacific Ocean, under a republican form of government after Feb. 2, 1912.

**AREA AND POPULATION.** There are 18 provinces of China proper; the so-called new dominion of Sinkiang, the dependencies of Manchuria, Fentien, Kirin, and Heilungkiang; and the regions over which only nominal authority exists, viz., Mongolia and Tibet. According to estimates made in 1912 the total area is 3,913,560 square miles, though more recent estimates have placed it as high as 4,227,170; population, estimated at that time at about 325,000,000; but later estimates greatly exceed this figure. For example, the total, based on esti-

mates of the Chinese Maritime Customs of 1923, was given at 444,968,000, which figure does not include 19,290,000 assigned to Manchuria. In the same year the Chinese Post Office estimated the total population of China and the Outer Territories at 436,094,953.

There are similar divergences in the estimates of the population of the cities. According to the government estimate of 1921, the population of Peking and its suburbs was about 1,300,000. Another estimate places it at 924,334, including about 4000 foreigners. The estimates for the chief Chinese ports in 1923 given out by the Chinese Maritime Customs were as follows: Shanghai, 1,500,000; Hankow, 1,646,800; Canton, 900,000; Hangchow, 340,200; Changsha, 533,800; Soochow, 500,000. The total number of foreigners and foreign residents in China in 1923 according to the estimate of the Chinese customs authorities was 324,947, of whom 201,704 were Japanese, 85,856 Russians, 14,775 British, 9356 American, 3424 Portuguese, 3361 French, and 2233 Germans. The treaty powers in China down to the beginning of 1925 were as follows: Russia, Great Britain, United States, France, Norway, Sweden, Denmark, Netherlands, Spain, Belgium, Italy, Peru, Brazil, Portugal, Japan, Mexico, Chile, Switzerland, Bolivia, Persia, and Germany. Of these powers, Germany, Bolivia, Persia, and Chile have renounced the consular power.

**EDUCATION AND RELIGION.** According to the latest available statistics for education the total number of higher primary schools was 10,236 with 582,579 pupils; and of lower primary schools, 167,076 with 5,814,375 pupils. At the beginning of 1925 there were 10 government universities situated in Peking and other large cities. Tsing Hua College, a special institution, was established near Peking to prepare students for education in the United States, under the agreement on the part of the United States to return the Boxer indemnity for that purpose. In May, 1924, the United States returned the balance of the American Indemnity, amounting to \$13,655,473, for this purpose. In September of the same year a Chinese-American Board of Trustees was appointed to administer this fund. There is a modern university for Chinese under British direction at Hongkong which is attended by students from many parts of China.

There are three forms of native religion, Confucianism, Buddhism, and Taoism. Besides these three there are Mohammedans in all the provinces, whose number has been estimated at 5,000,000 to 10,000,000. Roman Catholicism in 1923 maintained 57 bishops, 1481 European priests, 1071 Chinese priests, and the native Roman Catholics numbered 2,208,800. The Protestant missions in 1920 had 6636 engaged in their service and the native Protestants numbered 618,601.

**PRODUCTION.** China is essentially an agricultural country and the total area of arable land has been placed at 192,060 square miles; about four-fifths of the population are engaged in agriculture, the holdings being for the most part small. Primitive methods of cultivation prevail. The culture is intensive and in respect to vegetables has reached a high stage of perfection. Among the principal crops are wheat, barley, corn, millet, and other cereals; peas, beans, rice, sugar, indigo, cotton, silk, tea; and a great variety of fruits. In 1924, 5,422,359

acres were under cotton and the yield was 8,049,093 piculs. The following summary of industrial conditions in China was supplied by the United States Bureau of Foreign and Domestic Commerce: China, though yet a nation of handicrafts, during the last decade has witnessed marked progress in the development of more modern industrial enterprises within its borders. With the outbreak of the World War many commodities which China formerly secured from Europe could not be obtained, and, in consequence, factories were established in various parts of the country. Many of these factories are capitalized by British, German, and Japanese interests, and exist in or near the foreign-protected treaty ports. Their success in the production of foreign-type articles for home consumption gave much encouragement to the expansion of manufacturing along Western lines, until in 1925 manufactured goods of modern type were even beginning to find markets abroad. In 1921 the value of factory products exported from China amounted to 3,724,813 haikwan taels. In 1924 it totaled 18,810,291. Shanghai, the outstanding port and commercial city, is also the centre of industrial development, although much progress has been made in some other districts. A good illustration of the industrial progress is the expansion of the electric light and power plants. Prior to 1910 the use of electricity industrially in China was in an embryonic stage. In 1925 the number of electric power and lighting plants combined was estimated at nearly 400. There are few towns of any importance that do not have a lighting plant.

The greatest progress has been made in the textile industry, especially in cotton spinning and weaving. Chinese cotton goods are slowly gaining favor at the expense of the more costly foreign weaves. Chinese piece goods manufactured in Japanese-owned mills are being exported to Hongkong for South Africa and other countries to which they are suited. In 1924 the number of spindles in China was estimated at more than 3,000,000, as compared with 1,619,000 in 1919. The number of looms had increased from 13,403 in 1923 to 15,000 in 1924. Machinery of the most modern type finds an expanding market in the equipment of Chinese textile plants.

One of the oldest of all Chinese industries is that of silk, but its development has been handicapped by indifference to scientific methods of culture and production. The Japanese, owing to their readiness to adopt modern methods, long since usurped China's place as the leading silk-exporting country of the world, but in recent years some new methods and a good many improvements in the old ones have been introduced in China. Silk filatures and weaving plants of modern character are found in many parts of China. In 1923 it was estimated there were approximately 225 steam filatures in the country.

The increase in the number of modern flour mills is an interesting phenomenon of the industrialization of China. Harbin, alone, has 34 flour mills, with a capacity of 300,000 tons per year. In 1924 there were 160 mills throughout the country, with a daily capacity of about 270,000 fifty-pound bags. In 1924 there were 53 major companies engaged in the shipbuilding industry, with Shanghai as the centre. These firms

are turning out large ocean-going vessels, not only for use at home but also in foreign countries. Iron foundries, collieries, and machine shops are usually large enterprises, mostly in the hands of foreigners, or developed by foreign capital, and their expansion depends to a great extent upon the development of railways. Other industries that are expanding with less intimate relation to railway activities are sawmills, completely equipped with dry kilns and modern machinery; cement plants; sugar refineries; distilleries for the production of alcohol; and tanning, canning, and tobacco factories—most of which have been established within the last ten years.

**COMMERCE.** China's foreign commerce for 1924 showed a considerable increase over that of 1923 despite numerous adverse factors, there having been an increase of 113,800,000 haikwan taels in the total value for the year. China's imports are mostly products wholly or mainly manufactured. During 1924 they were valued at 1,018,210,667 taels, an increase of 94,807,790 taels when compared with 1923. Imports of cotton piece goods and yarn amounted to 188,501,000 taels in 1924, an advance of almost 15,000,000 taels over 1923. Imports of metals and minerals of all kinds totaled 67,800,000 taels, compared with 44,900,000 taels. Throughout the year imports of machinery were dull and aggregated only 9,411,611 taels, a decrease of practically 6,000,000 taels from those of 1923. Flour imports increased from 27,232,948 taels in 1923 to 30,097,693 taels in 1924, and at the same time receipts of wheat totaled 17,689,749 taels—an increase of more than 7,500,000 taels compared with 1923. Rice and paddy imports amounted to 63,248,721 taels in 1924, a decrease of 35,000,000 taels. Kerosene imports in 1924 reached a value of 57,811,062 taels, against 58,291,716 the year before.

The export trade of China was valued at 771,784,468 haikwan taels—a gain over the previous year of 18,867,052 taels. Exports from China

#### PRINCIPAL IMPORTS AND EXPORTS OF CHINA

<sup>a</sup> The average exchange rate of the haikwan tael in 1923 was \$0.80; in 1924, \$0.81.

are chiefly raw materials. There was a decline of approximately 32,000,000 taels in the export of raw silk and cocoons. The tea crop was the most disappointing for many years, and exports dropped from 22,905,341 taels in 1923 to 21,127,221 taels for 1924. Exports of raw cotton amounted to 40,420,414 taels, compared with 32,605,771 taels in 1923. The accompanying table supplied by the United States Bureau of Foreign and Domestic Commerce shows the value of the principal commodities imported or exported by China during 1923 and 1924.

Exports from China to the principal countries during 1924 showed a substantial increase in all but two instances, those to the United States and Hongkong registering decreases compared with the previous year. The most interesting features of China's import trade were larger imports from the United States and smaller imports from British India. China's purchases in the United States amounted to 190,956,942 taels in 1924, an increase of 36,500,000 taels over 1923, and an advance to 18.4 per cent of China's total imports as compared with 16.3 per cent in 1923. Imports from British India, on the other hand, declined almost 17,000,000 taels, the percentage of receipts from British India dropping from 5.8 in 1923 to 3.7 in 1924. The following table shows the origin of China's imports and the destination of exports in 1923 and 1924:

#### DIRECTION OF CHINA'S FOREIGN TRADE

Countries of origin or destination	Haikwan taels (000's omitted)	Per cent of total <sup>a</sup>	Haikwan taels (000's omitted)	Per cent of total <sup>a</sup>
<b>Imported from</b>				
	1923		1924	
Japan	211,024	22.3	234,761	22.6
Hongkong	248,083	26.2	243,919	23.5
United States	154,447	16.3	190,956	18.4
Great Britain	120,397	12.7	126,011	12.1

Germany	11,914	1.6	15,949	2.1

<sup>a</sup> Per cent of total imports or exports for the year.

**FINANCE.** There has been virtually no budget in China since 1919. An estimate of the revenue in 1923 was 528,036,517 Chinese dollars and the expenditure, 548,678,840 dollars. In April, 1925, the Chinese government created a commission for the consideration of the financial reorganization of the country. The commission was to be composed of (a) the Minister of Finance, Minister of Communications, chairman of the board of credit, director general of the wine and tobacco administration, and the director of the salt administration; (b) high authorities, military and civil of each province and administrative district; and (c) 10 to 16 members at large to be appointed by the chief executive from those "educated and experienced in finances." Chief among the problems before the commission are the balancing of the budget and the reorganization of national and local taxation so as to provide separate sources of revenue for each. Other considerations are the reorganization and consolidation of the foreign and domestic loan service and the preparation of an authoritative statement of the total indebtedness of the country; the provision of funds to pay

troops to be disbanded; and the general audit of the government's expenses.

According to the *Commerce Reports* of the United States Department of Commerce, the treaty Powers have agreed to grant China tariff autonomy effective Jan. 1, 1929, provided China abolishes the likin tax on the interior movement of commodities prior to that date. The economic effects of this action are likely to be most important. China's whole position as a capital importing country may eventually, in the course of years, be vitally affected by the industrial development that tariff autonomy may bring. In granting China the right to control its own tariff policy the Powers who are dominant in the country's import trade probably have realized that their best interests lie in the economic development of China. The demand for tariff autonomy has been only one significant indication of the economic factors underlying the present nationalist movement. Growing opposition to foreign loans and concessions and the demand for equalization in the taxation of foreign and domestic goods are other indications. The era of foreign penetration seems to have ended and the era of intensive self-development to have begun.

On Jan. 1, 1923, the foreign debt amounted to 2,067,881,404 Chinese dollars, of which 1,356,536,690 dollars represent interest-bearing funded foreign debt, and 486,741,572 dollars floating debt. The internal debt at that time was 252,036,595 dollars. The annual charge of the debt is estimated to be 165,386,076 dollars.

COMMUNICATIONS. During 1923, 182,722 vessels of 131,304,556 tons entered and cleared Chinese ports and were distributed by nationality as follows: American, 4994 of 5,968,261 tons; British, 44,055 of 51,965,230 tons; French, 1948 of 1,839,731 tons; Italian, 396 of 200,172 tons; Japanese, 25,063 of 33,288,617 tons; Russian, 368 of 255,138 tons; Chinese, 102,245 of 32,433,847 tons.

At the end of 1922 there were more than 7503 miles of railway in China, excluding 1857 miles in Manchuria.

GOVERNMENT. According to the constitution of Oct. 10, 1923, legislative power is vested in a parliament, which consists of a senate of 264 members and a house of representatives of 596 members. Executive power is vested in a president aided by a cabinet. The presidency was vacant at the beginning of the year, the chief executive being Tuan Chi-jui, installed Nov. 24, 1924. The cabinet appointed at the same time was constructed as follows: Interior, Kung Sing-Chau; Foreign Affairs, Tang Shao-Yi; Agriculture and Commerce, Yang Shi-Kan; Education, Wang Chu-Lin; Communications, Yeh Kung-Cho; War, Wu Kuan-Sing; Navy, Liu Chien-Chang; Justice, Chan Shih-Chow; Finance, Li Sze-Hao.

### HISTORY

CIVIL WAR. The internal dissension which was rife during 1924 continued almost unabated during 1925, with varying changes of fortune on the part of the combatants. During the first month of the year the centre of the struggle moved from North China to the Yangtze River. Marshal Lu Yung-hsiang was ordered to drive Marshal Chi Hsieh-yuan out of the province of Kiangsu. Marshal Lu was aided by battalions of "white" Russians. At the beginning Chi was

compelled to flee to the neighborhood of Shanghai and take refuge in the foreign settlement. Here he formed an alliance with Sun Chuan-fang and struck a successful blow at the Peking leader of the district. The fighting in the neighborhood of Shanghai necessitated the sending of foreign warships to its vicinity in order to protect foreign property and to prevent the looting of the foreign section of the city. Lu in the meantime had been pursuing Chi and defeated him at Wusih. Chi was compelled to flee to Japan with his family on January 28. This defeat placed control of the Shanghai district in the hands of the Peking government, which abandoned the arsenal at that city and forbade the stationing of troops nearby in order to remove one of the chief causes of fighting between rival provincial governors in the surrounding districts.

DEATH OF DR. SUN YAT-SEN. On March 12, Dr. Sun Yat-sen (q.v.), the best known revolutionary leader of China, died. He was the organizer and chief mover in the anti-Manchu and republican forces. In 1911 when the republic was established he was the first president. He stepped aside to permit Yuan Shih-kai to become president because Dr. Sun felt that he had far more ability as an administrator than he himself possessed. At the time of his death he was in alliance with men who were formerly bitter enemies, notably, Tuan Chi-jui and Marshal Chang of Manchuria.

REORGANIZATION CONFERENCE. On February 1 a conference was convened in Peking to discuss the ills of the country, chiefly the settlement of the military difficulties. The conference, which held its meetings in secret, was dissolved on April 21. Virtually nothing was accomplished beyond providing for the election of a Citizens' Conference, which was to make suggestions concerning a new constitution and report its decisions to a commission appointed by the Peking government to draft a new constitution. A provisional senate was to be convened to give a slight degree of *de jure* government to the rule of Marshal Tuan Chi-jui, who became chief executive, when President Tsao Kun was compelled to resign.

ANTI-FOREIGN DISTURBANCES. During the summer, serious anti-foreign activities were prevalent in the neighborhood of Shanghai. Strikers from Japanese mills and students of schools in the city organized a big demonstration on May 30, parading through the streets of the city, particularly in the foreign section, and demanding various reforms. The police were compelled to fire into the mob as a protection against destruction of foreign property. Rioting followed for the next three days and several deaths were reported. The foreign settlement prepared for a state of siege and naval vessels of several foreign nations were rushed to the scene; it was not until a week later that the situation was under control. The Chinese government protested against the action of the police to the foreign legations but were told that the police merely did their duty. In certain quarters the labor unrest and anti-foreign activities were laid at the door of Bolshevik Moscow, although this was strenuously denied in the Russian papers. Competent observers reported that it was quite obvious that the Western nations were losing their prestige in China and had been since the World War. Canton and Peking were also disturbed by anti-foreign demonstrations during this

period. The period of active demonstration' was followed by a period of peaceful demonstration and a practical boycott of British and Japanese goods. The Chinese seemed to be particularly incensed against these two nations and a demand for war against Great Britain was heard in various quarters. See **MILITARY PROGRESS**.

**CHRISTIAN CHURCH.** A church originating in three religious movements, that of the Rev. James O'Kelly of Virginia, who opposed Methodist Bishops in 1792, and those of the New England Baptist, Abner Jones, who organized a separate church in 1801, and of the Kentucky group, formed in 1804. The component bodies eventually united, all holding that minor points of belief should be subordinated to Christian brotherhood. A General Convention meets every four years, and was to convene at Urbana, Ill., in October, 1926. Biennial conventions are held in districts, each of a number of States. The church carries on home and foreign missions, denominational work, publication, Evangelism, Christian unity work, social service, and other general activities. Its home mission field includes new Americans in the East, the lumber camps in Washington, Indians, mountaineers, and negroes; its foreign field, Japan and Porto Rico. It maintains eight educational institutions. Its publishing house, at Dayton, Ohio, issues among other periodicals, the oldest religious newspaper in the United States, the *Herald of Gospel Liberty*. In 1924 the Christian Church had 1134 churches, 1172 ministers, and 103,294 members. It raised a total revenue of \$1,274,123. Its Sunday schools, numbering 946, had 94,271 pupils.

**CHRISTIAN ENDEAVOR, UNITED SOCIETY OF.** An international, inter-racial, and interdenominational movement for young people which was founded in 1881 for the purpose of training converts for church membership and church work. It meets biennially, and in 1925 convened for its 30th Convention at Portland, Ore., July 4-9. A World's Christian Endeavor Convention was to be held in London, England, July 16-21, 1926, and an International Convention was to take place in Cleveland, Ohio, July 2-7, 1927. Four departments comprise the activities of the society: Junior, Intermediate and Young People's Societies and Alumni Councils. Statistics for 1923 showed 79,157 societies, of which 46,560 were in the United States, 4090 in Canada, and 28,507 in foreign countries. For 1925 the enrollment in the various groups of the society was: Comrades of the Quiet Hour, whose members covenant to spend a definite portion of each day in prayer, 238,478; the Tenth Legion, whose members make the tenth their minimum gift for religious work, 70,705; and Life Work Recruits, composed of young people who have agreed to give themselves to full time service in the Christian ministry or in missionary work, 8002. The Alumni Department of the Society was established in 1919; it is composed of Christian Endeavor Experts who have passed a definite examination in Christian Endeavor methods and principles. In 1921 there was a membership of 31,641, and in 1923 the alumni fellowships numbered 240. For the 1923-25 period, the Friends-of-Christ Campaign was undertaken; it aimed to bring to a knowledge of Jesus Christ and into

His church a number equal to 50 per cent of the active membership of the Society; gratifying progress was reported to have been made with this programme in 1925. Reports of the work in foreign countries during the year also were encouraging: 5200 societies were listed by the British Christian Endeavor Union, with over 150,000 in their membership; Germany reported 1600 societies, or an increase of 147 over the previous year; Hungary had 20 societies; Poland, 137; China, 2000; India, 1200. Of the denominations, the Presbyterians led in the number of societies in America, the Methodists in Great Britain, and the Lutherans in Germany and Northern Europe. The *Christian Endeavor World* (weekly) is the official publication of the Society. Officers for the current biennial period were: President Emeritus, Rev. Francis E. Clark; President, Daniel A. Poling; Vice-Presidents, Howard B. Grose and William Hiram Foulkes; Clerk, Clarence C. Hamilton; Treasurer, A. J. Shartle. Headquarters of the Society are at Mount Vernon and Joy Streets, Boston, Mass. Edward P. Gates is General Secretary.

**CHRISTIAN SCIENCE.** The first church of this movement was founded by Mrs. Mary Baker Eddy in Boston in 1879 and was given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as the First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook for the movement, *Science and Health with Key to the Scriptures*, published in 1875. Christian Science is a system of metaphysical or spiritual healing discovered by Mrs. Eddy in 1866. In 1925 there were over 7828 practitioners of Christian Science in the United States and other countries who devote their entire time to healing the sick through prayer. The Sunday services of the church are conducted by a first and second reader, the first reading from the textbook, and the second reading from the authorized version of the Bible. A Board of Directors administers the affairs of the Mother Church. The annual meeting was held in Boston, June 8. Reports indicated expenditures totaling \$1,158,084.17 in the General Fund of the Church during the year, and \$422,343.13 in the Permanent Special Funds. During the fiscal year ending May 31, 17 churches and 75 Christian Science societies, including four university societies were recognized as branches of the Mother Church; 21 new organizations are located in Europe, South Africa, Tasmania and New Zealand. The total number of recognized branches, including 28 college and university societies, was 2202. Three departments conduct the principal activities of the movement: the Board of Education, Board of Lectureship, and Committee on Publication. The educational board instructs and authorizes students to teach Christian Science. The Board of Lectureship consists of 23 members who deliver free lectures on Christian Science throughout the world. During the year, 3257 lectures were delivered, of which 2945 were in the United States and Canada, and 312 in foreign fields. The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the author-

ized literature of the Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a Board of Trustees according to the Manual of the church. The publishing society issues the daily paper of the movement, *The Christian Science Monitor*; other periodicals of the Scientists include: *The Christian Science Journal*, *The Christian Science Sentinel*, *Der Herold der Christian Science*, and *Le Herault de Christian Science*. The Benevolent Association of the church conducts a sanatorium, where more than 1600 guests were provided for during the year. A training course is also conducted for nurses. The headquarters of the church are at 105 Falmouth Street, Boston. David Newton McKee was president of the Mother Church for the year ending May 31, 1925.

**CHRISTIANS.** See DISCIPLES OF CHRIST.

**CHRISTMAS ISLAND.** A British island in the Indian Ocean, lying 190 miles southwest of Java, annexed to the Straits Settlements in 1889. Area, 62 square miles; population, estimated at 1100 in 1921. Christmas Island is of importance because of its very large deposits of phosphate of lime, which constitutes its only export. Exports in 1923 amounted to £134,424; imports, £49,251. The chief imports are tools, machinery, railway materials, and lorries. For purposes of administration the island is connected with the settlement of Singapore. Christmas Island is also the name of the largest atoll in the Pacific Ocean. It belongs to the British colony of Gilbert and Ellice Islands.

**CHURCHILL, GEORGE BOSWORTH.** College professor and Republican political leader of Massachusetts, died July 1. He was born at Worcester, Mass., Oct. 24, 1866, and graduating from Amherst College in 1889 pursued graduate studies there and at the University of Pennsylvania, proceeding in 1894 to Europe where he studied at the Universities of Strassburg and Berlin, receiving the degree of Ph.D., from the latter institution in 1897. During his graduate studies he taught in various High Schools and was associate editor of the *Cosmopolitan Magazine* 1897-98, and in the latter year joined the faculty of Amherst College as associate professor of English and Public Speaking, becoming Professor of English Literature in 1905. Professor Churchill specialized in Dramatic Literature and was the American editorial representative of the *Jahrbuch der Deutschen Shakespear Gesellschaft* as well as a member of other German literary and linguistic societies. He was the author of *Richard III Up to Shakespear* (1900); and *Discriptive Catalogue of the Latin University Plays of England in the Time of Elizabeth* (with Prof. Wolfgang Keller) (1898). In 1917 as a Republican he was elected as a member of the Massachusetts Senate, being re-

elected in 1918 and 1919, serving also as a delegate to the Massachusetts Constitutional Convention in 1917, 1918, and 1919. In 1924 he was elected United States Representative from Massachusetts.

**CINCINNATI, UNIVERSITY OF.** A coeducational, municipal institution of higher learning at Cincinnati, Ohio; founded in 1871. The enrollment in the autumn of 1925 was 6257, distributed as follows: graduate school 314; liberal arts 1191; evening liberal arts 817; engineering and commerce 1181; evening commerce 1522; applied arts 185; education 478; law 95; medicine 260; school of nursing and health 150; home administration 64. In the summer school of 1925 the attendance was 1479. The faculty numbered 418. The productive funds of the institution for the fiscal year 1924 were \$5,397,-271.12; and the income for the year \$1,247,-528.90. The library contained 118,000 volumes. During the year there were built the Alphonso Taft Hall for the Law Department and Swift Hall for engineering. President, Frederick Charles Hicks, Ph.D.

**CITY AND REGIONAL PLANNING.** An event of the year was the meeting in New York City of the International Conference on City and Regional Planning. The proceedings were reported in a large volume issued by the National City Planning Conference (New York City). *Regional Planning* studies in America were continued by the Chicago and the Los Angeles County associations and the Regional Planning Association of San Francisco Bay Counties was created embracing an area of 4000 square miles in which were 58 incorporated municipalities and a population of 1,500,000 (See *The American City* (New York) July, 1925, and *Engineering News-Record* (New York) Sept. 10, 1925. Progress continued on the Chicago Plan of many years' standing, the work being largely street widening. Progress in England under the British Housing and Town Planning Act of 1909 and its amendments seemed slow when the small total of the schemes of only 12 authorities approved by the Ministry of Health, with those of seven more authorities awaiting final action by the ministry, making 26 schemes in all, including authorities having more than one scheme, was taken into account, but the picture was brighter when consideration was given to the number of schemes that were already well advanced. These planning schemes, before receiving final sanction by the Ministry of Health, must go through several stages. Under the first of these stages, known as the filing of a preliminary statement, it has become common to submit what is practically almost a final plan, said Prof. Patrick Abercrombie, president of the Town Planning Institute of Great Britain, in an address before the institute on Nov. 13. Nearly a hundred town planning schemes were in the preliminary statement stage and about half of these had been approved as of that stage. Al-

together, therefore, says Professor Abercrombie, there were "about 125 town planning schemes practically finished, representing 85 local authorities and 287,207 acres." The number of local authorities in England and Wales that may submit town planning schemes if they see fit was 1774. Of these, there were 240 authorities with populations of 20,000 and over which must submit schemes by the beginning of January, 1929. Only a half of these 240 authorities, the Ministry of Health stated in its report for 1924-25, had taken any action whatever at the end of the fiscal year mentioned. Local authorities were given power to prescribe building lines by the Public Health Act of 1925.

**ZONING.** On July 1, 1925, there were in the United States 366 cities and towns with a combined population of 26,000,000 that had adopted zoning regulations, a growth since September, 1921, from 48 places and 11,000,000 population, according to information compiled by the Division of Building and Housing of the U. S. Department of Commerce. The revised figures included 27 of the 33 cities of the United States having populations of 200,000 and more. Among the 46 places that adopted zoning during the first half of 1925 were Denver, Colorado, Hartford, Connecticut, and New Bedford, Massachusetts, all places of 100,000 population or more. In December, Buffalo, New York, adopted a zoning ordinance, published in *Buffalo City Record*, Dec. 28, 1925. Of the nine States that had not authorized zoning prior to 1925, five passed zoning laws before July 1: Maine, New Hampshire, Idaho, Utah and Arizona. Four of these States based their legislation wholly or in part on the "Standard Act" formulated by a committee of specialists created by the Department of Commerce, while a number of other States used the "Standard Act" in supplements to existing zoning legislation. A Pennsylvania amendment provided for the boards of appeal considered by most of the specialists as essential to zoning administration.

The constitutionality of zoning continued to be bitterly attacked in State courts, with decisions in different States ranging all the way between the two extremes of conservatism and liberalism. In New Jersey, the strengthening of the State zoning authority by the legislature of 1924 had had little effect upon trial courts, which followed closely the decision of the highest court of the State in 1924, which, while not putting a ban on all zoning as outside the police power, rendered so sweeping a decision as to amount to that when cases came to trial. Some New Jersey municipalities stood by their zoning ordinances thus forcing property owners who were unwilling to accept administrative rulings to take their cases to the courts, even though the courts were almost sure to rule against the city. Meanwhile a constitutional amendment authorizing "use" zoning, which rather than "height" or "area" zoning is the question chiefly in issue, passed one session of the legislature and if approved by the 1926 legislature was to go to popular vote in November. The Illinois Supreme Court, in passing on a case affecting the city of Aurora, where a permit had been denied for a four-family apartment house so designed that it could be used in part as a grocery store, ruled against the ordinance, but solely on the ground of discrimination "between property owners now using their property

for non-conforming uses and those hereafter desiring to use their property in exactly the same manner."

Decisions favorable to zoning were rendered by the Supreme Court for the District of Columbia, which upheld a Congressional zoning act applicable to the District, and by the Supreme Court of California, which in two Los Angeles cases held that zoning to establish and protect residential districts against business and apartments was a legitimate exercise of the police power, for the general welfare of the American home and for the general good. The same court held unreasonable a zoning ordinance of the town of Atherton, because it allotted only 1.1 acre of land for business purposes, and that land already occupied. The New York Supreme Court upheld the opposition of near-by residents to the erection of a large apartment house in White Plains, on the ground that its size was in excess of the zoning regulations. This case was unusual in that the local board of appeals had overruled the local building inspector's denial of the permit. The court held: "There is no question about the validity of the zoning ordinance of the City of White Plains and this ordinance declared that an apartment house may not exceed 35 per cent of the area of the lot, and it may not exceed 35 feet in height and it shall not contain more than 53 families per acre. The apartment house proposed . . . would exceed by 2.9 per cent the area limitation and would be about 10 feet higher and would accommodate 92 families instead of 53." In *England* the Ministry of Health, in its report for 1924-25, records a number of interesting rulings on zoning (summarized in the *London Surveyor*, Sept. 18, 1925). In one of these a garage on a main road was permitted on condition that it be set back far enough to prevent waiting vehicles from interfering with traffic, but in another case a motor omnibus depot on a site largely surrounded by small dwelling houses in a residential area was disallowed. The preservation of the amenities of a river was suggested by the Ministry of Health in connection with an application for permission to erect shops to serve a residential district near a river. See *City Planning* (Cambridge, Mass.), a quarterly started in 1925 as the official organ of The American City Planning Institute, and The National Conference on City Planning; also *Town Planning Review*, a British quarterly (Liverpool, England). See MUNICIPAL GOVERNMENT.

**CITY GOVERNMENT.** See MUNICIPAL GOVERNMENT.

**CITY MANAGER.** See MUNICIPAL GOVERNMENT.

**CIVIC FEDERATION, NATIONAL.** See NATIONAL CIVIC FEDERATION.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** This organization was founded in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office. It sought to accomplish this end by promoting administrative efficiency through the application of the merit system to the appointment, promotion, and tenure of government employees. The movement is made up of local associations in various parts of the country, and of individual members not in local groups.

During 1925 the League sponsored legislation to empower the President to place in the classi-

fied civil service all positions exempt by statute; to provide for the appointment of all postmasters and rural carriers through the merit system; to place prohibition agents in the classified civil service; and to abolish the Federal Personnel Classification Board, transferring its functions to the United States Civil Service Commission in order that the technical problems of personnel might be in the hands of one central agency. The League protested against a bill to create a commissioned medical personnel in the Veteran's Bureau, thereby exempting a large group of civil employees from the classified civil service, as experience had proven that competent physicians could be obtained through competitive examination. The League also condemned the continuance of an executive order issued by President Harding providing for the appointment of one out of the first three names on eligible lists for the appointment of presidential postmasters. This action was taken after an investigation of the operation of the order, and the revelation of the fact that it invited political influence to dictate appointments of postmasters. Congress was urged by the League to enact a bill placing all postmasters under the merit system, and the President was urged to require the selection of the first person on the eligible list. An investigation of the appointments of deputy collectors of internal revenue indicated that the number of such positions was increasing due to being used as political patronage. Legislation empowering the President to place these positions in the classified service was supported by the League. Through its field division the League endeavors to secure the adoption of civil service laws in the various states and cities. Pamphlets on the various fields of its investigation are issued from time to time. Recent publications included: *The Story of the Merit System*; *Roosevelt and the Spoilsmen*; *Who Inspects Our Food?* *Good Government* is the official organ of the movement. The officers in 1925 were as follows: President, Robert Catherwood; Treasurer, A. S. Frissell; Secretary, Harry W. Marsh. Headquarters are located at 8 W. 40th Street, New York City.

**CLARK, WILLIAM ANDREWS.** American miner, capitalist and one-time senator for the State of Montana, died March 2. He was born at Connellsville, Pennsylvania and received a common school education at Laurel Hill Academy and other schools. After his family moved to Iowa he studied law at Mt. Pleasant University in that State. He did not practice, but taught school in Missouri from 1859 to 1860 and then went to Colorado in 1862. In the following year he settled in Montana, and became engaged in various enterprises which from small beginnings developed into large industries. In the early seventies he acquired a mine in Butte and in two years took out of it more than 30,000,000 pounds of copper. He was constantly studying, and he attended the Columbia School of Mines in New York City in order to gain a further knowledge of mining engineering. In 1876 he was State orator at the Centennial Exposition, representing Montana, and in the following year he was Grand Master of the Montana Masons. In 1878 he was major of the Butte battalion in the Nez Perce campaign. His interest in politics now manifested itself, and he was chosen as president of the Constitutional Conventions of 1884 and 1889. He was Commis-

sioner from Montana to the New Orleans Exposition in 1884 and in 1888 he was Democratic candidate for delegate to Congress. In 1890 he was nominated by the Democratic party for United States Senator and claimed the election, but the seat was refused. Again a candidate in 1898, he was elected, but there resulted a bitter controversy before the Senate Committee on Elections and Privileges, begun by a political rival, Marcus Daly, the owner of the Anaconda Mine. This committee recommended that the Senate adopt a resolution to the effect that Clark "was not duly and legally elected to the seat in the Senate." Senator Clark resigned, being soon afterwards appointed to fill the vacancy caused by his own resignation. This appointment, made by the Acting Governor, was subsequently declared by the Governor to be invalid, but the Montana Legislature elected Clark to the United States Senate for the term 1901-1907 and this term he duly served. His commercial interests in Montana were those of a banker, mine owner, and manufacturer and he was head of many corporations. He was interested in the control or development of the United Verde Copper Company, such mining companies as the Mayflower, the Moulton, and the Ophir Hill Consolidated, the Colusa-Parrot Mining and Smelting Company, and various railway, land, water, and other corporations. His mining corporation activities were carried on with considerable struggle and at times bitterness towards his rivals, and in addition to mining he engaged in railway construction, lumbering and beet sugar production. He was an art collector and his large New York home contained a valuable collection of paintings and other works of art.

**CLARK UNIVERSITY.** A non-sectarian institution of the higher learning at Worcester, Mass.; founded in 1889. The enrollment for the fall of 1925 was 348, including 231 undergraduate students, 66 graduate students, and 51 special students. For the 1925 summer session 142 registered. The faculty numbered 45, including Walter F. Hunter, professor of genetic psychology; Rolland R. Smith, assistant professor in mathematics and education; and two instructors appointed during the year. The productive funds amounted to approximately \$5,000,000. The library contained 105,000 volumes. The publication of two new quarterly journals, the *Journal of Economic Geography*, and *Genetic Psychology (Monographs)* was begun in 1925. President, Wallace W. Atwood, Ph.D.

**CLARKE, JOHN MASON.** American geologist and paleontologist, died May 29. He was born at Canandaigua, N. Y., Apr. 15, 1857, and graduated at Amherst in 1877. He studied in Germany at the University of Göttingen, 1882-84, and at the University of Marburg (1898) from which he received the degree of Ph.D. In 1881 he was professor of geology and mineralogy at Smith College serving until 1884, and in the following year lectured in geology at the Massachusetts State Agricultural College. In 1886 he became assistant New York State paleontologist and in 1894 assistant State geologist. In 1898 he was made State paleontologist serving until 1904 when he was appointed State geologist and State paleontologist, and director of State Museum and Science Department of the University of the State of New York, a position he held at the time of his death. In 1894 he was made professor of geology and mineralogy at

Rensselaer Polytechnic Institute. He was chairman of the New York State Board of Geographic Names and received the Hayden gold medal in 1908 and in 1920 the gold medal of the Permanent Wild Life Protection Fund. He was president of the Geological Society of America in 1916-17 and chairman of the geological committee of the National Research Council, 1917. He also was president of the Albany Institute and Historical and Art Society, the wampum keeper of Iroquois Nation, and a member of many learned societies and other bodies. For his scientific work Professor Clarke was honored with the degree of LL.D. from Amherst, 1902; Johns Hopkins, 1915; and Sc.D., Colgate, 1909; University of Chicago, 1916; and Princeton University, 1919. His publications included many technical studies of the Devonian Period; *Sketches of Gaspé; The Magdalen Islands; Heart of Gaspé; The Life of James Hall; Organic Dependence and Disease; L'Île Percée.*

**CLARKE, JOSEPH IGNATIUS CONSTANTINE.** American playwright and journalist, died February 27. He was born at Kingstown, Ireland, July 31, 1846, and in 1868 came to the United States. From 1870 to 1883 he was a member of the editorial staff of the *New York Herald* and in the latter year became managing editor of the *New York Journal*, a position he held until 1895. He was editor of the *Criterion* from 1898 to 1900, and Sunday editor of the *New York Herald* from 1903-1906. In the latter year he became chief of the publicity department of the Standard Oil Company. Actively interested in Irish History, he was president-general of the American Irish Historical Society from 1913 to 1923, and at the time of his death a member of its executive council. He was also president of the National Art Theatre Society, and a director of the American Dramatists. In 1914 he traveled extensively in Japan and China contributing articles to newspapers in the United States and later publishing a book entitled *Japan at First Hand* (1918). His more prominent plays were: *Heartsease* (in collaboration); *For Bonnie Prince Charlie; The First Violin; Her Majesty; Lady Godiva; Great Plumed Arrow; and The Prince of India.* He also wrote: *Robert Emmet, a Tragedy* (1888); *Malmorda, a Metrical Romance* (1893); *Manhattan, an Ode for the Hudson-Fulton Celebration* (1909); *The Fighting Race and Other Poems and Ballads* (1911); *Sullivan, 1779* (poem) (1912); *John Barry* (poem) (1914); and *Ireland at the Fair* (poem) (1915). An autobiography entitled *My Life and Memories* was published shortly after his death.

**CLARKE-McNARY FORESTRY LAW.** See FORESTRY.

**CLASSIC ANTIQUITIES.** See ARCHAEOLOGY.

**CLASSICAL PHILOLOGY.** See PHILOLOGY, CLASSICAL.

**CLAY.** The industry of producing clay in the United States for sale, as distinct from the production of clay for direct use by the producers, as in the cement and brick industries, attained its largest recorded totals in the year 1924, for which the figures were published by the U. S. Bureau of Mines in October, 1925. Clay products of all kinds, sold in the United States in 1924, totaled 3,691,119 short tons, valued at \$11,507,536, a gain of 7 per cent as to quantity and 3 per cent as to value over the production of

1923. Fire clay, the kind most extensively produced for sale, attained a production in 1924 of 2,443,710 short tons, valued at \$6,737,063, as against 2,298,163 short tons, valued at \$6,565,899, in 1923, the 1924 totals being the largest recorded for any year. Kaolin and similar clays, the next largest classification in point of values, fell somewhat behind the production of the high year 1923. The decrease was 3 per cent in quantity but the value was only a fraction of 1 per cent lower; the totals of production being, for 1924, 326,611 short tons, valued at \$2,923,965; as against 336,803 short tons, valued at \$2,926,255, for 1923. Totals of brick clay produced and sold were not computed separately, the proportion of all brick clay productions that fall under this heading being small.

Imports of clay in 1924 exceeded those of 1923 by 52,715 short tons, or 13 per cent, and in value by \$305,071, or 8 per cent, and were for 1924, 444,067 short tons, valued at \$3,976,040. Of this total, kaolin imports formed about 80 per cent in value, being 353,124 short tons, valued at \$3,188,454. Clay exports in 1924 were of fire clay to the extent of 57 per cent of the entire quantity. The exports decreased 14 per cent in quantity and rose 16 per cent in value, being for 1924, 72,755 short tons, valued at \$732,716. The clay-like material occurring abundantly in parts of some western States, and known as bentonite, as soap clay, and by other names, first reported in Wyoming in 1898 by the State geologist W. C. Knight, attained growing importance in certain industries in 1924. It had previously been used to some extent in the manufacture of paper, soap and cosmetics, but more lately was utilized in California under a patented process for the de-coloring of oil.

**CLAY, ALBERT TOBIAS.** American orientalist, died at New Haven, September 14. He was born at Hanover, Pa., Dec. 4, 1866, and after graduating from Franklin and Marshall College in 1889 pursued post graduate studies at Mt. Airy Theological Seminary and University of Pennsylvania from which institution he received the degree of Ph.D. in 1894. After serving as Assyrian fellow and instructor of Hebrew at the University of Pennsylvania he became instructor in various theological seminaries, and in 1899 joined the faculty of the University of Pennsylvania as lecturer in Hebrew, Assyrian, and Semitic archaeology becoming assistant professor of Semitic philology and archaeology in 1903, and professor in 1909. In 1910 he was called to Yale University to become Laffan professor of Assyriology and Babylonian Literature and in 1912 became Curator of the Yale Babylonian Collection. In 1919-20 he was professor at the American School of Oriental Research in Jerusalem and as a member of the Archaeological Institute of America, of which he had been vice-president in 1917, he was appointed to visit Bagdad and arrange for the establishment of a school of Oriental Research. He was an active member and officer of the American Oriental Society, the Society of Biblical Literature and Exegesis, the Palestine Oriental Society, and many similar organizations in America and Europe. For his scientific work he received the honorary degree of A.M. from Yale in 1910, LL.D. from Pennsylvania College in 1913, and Litt.D. from Muhlenberg College, Pennsylvania, in 1918. He was the author of many books containing discussions or translations of ancient documents and records, some of

which included a study of various commercial and legal records based on ancient inscriptions. He translated and edited the Babylonian records in the library of J. Pierpont Morgan and various other collections, and was a frequent contributor to general as well as scientific works on matters of archaeological interest.

**CLIMATE.** See METEOROLOGY.

**CLOWRY, ROBERT CHARLES.** American capitalist and former president of the Western Union Telegraph Company, died February 26. Born in Will County, Illinois, Sept. 8, 1838, he received a public school education and his first work was as a telegraph messenger boy where in Springfield before the Civil War he dispatched telegrams for Abraham Lincoln. He continued in the telegraph industry and during the Civil War was appointed Captain, Assistant Quartermaster of Volunteers Oct. 27, 1863, receiving the brevet of Major and Lieutenant Colonel of Volunteers Mar. 13, 1865, for "meritorious service and devoted application to duty." Until May 31, 1866, when he was honorably mustered out of service, he was in charge of the United States Government military telegraph lines. After the War he served in various capacities with the Western Union Telegraph Company, being President and General Manager from April, 1902, to Nov. 23, 1910. He was a director in various corporations including the Equitable Trust Company of New York.

**CLUTZ, JACOB ABRAHAM.** American theologian, died at Stockholm, Sweden, while attending the Universal Christian Conference, September 8. He was born in Adams County, Pa., Jan. 5, 1848, and graduated from Pennsylvania College in 1869 with the degree of A.B. and studied at the Lutheran Theological Seminary, Gettysburg, Pa., from which he was graduated in 1872. After serving as pastor in Lutheran churches at Newville, Pa., and Baltimore he became general secretary of the Lutheran Board of Home Missions in 1883, acting in this capacity until his election as president of Midland College, Atchison, Kansas, in 1889. While at this college he was also professor of homiletics and Christian ethics in the Western Theological Seminary at Atchison. In 1904 he became pastor of St. James' Church in Gettysburg, and in 1909 professor of practical theology in the Lutheran Theological Seminary at Gettysburg. He was secretary of the Lutheran Board of Foreign Missions, 1877-83; president of the Lutheran General Synod, Lebanon, Pa., 1891; treasurer of the Lutheran Board of Home Missions, 1905-13, and its president for two years subsequently. He was secretary of the ways and means committee which worked to effect a merger of the Lutheran General Synod, the General Council, and the United Synod in the South in 1917-18, and from 1918 to 1924 he was a member of the executive board of the United Lutheran Church in America. In 1889 he received the degree of D.D. (Pennsylvania College) and in 1920 that of LL.D. (Midland College, Nebraska).

**COAL.** According to the U. S. Bureau of Mines preliminary estimates the world's production of coal in 1924 fell slightly below that of the preceding year. The total output, as shown in the table below, was estimated at 1,354,300,000 metric tons. During the years 1923 and 1924 production had surpassed the pre-war levels and was about the same as in the preceding record year, 1917.

# WORLD PRODUCTION OF COAL, 1911-1924

Year	Production in part estimated (Metric tons)	Per cent produced by United States
1911	1,189,000,000	37.9
1912	1,249,000,000	38.8
1913	1,342,000,000	38.6
1914	1,207,000,000	38.7
1915	1,193,000,000	40.5
1916	1,291,000,000	41.5
1917	1,356,000,000	43.6
1918	1,333,000,000	46.3
1919	1,173,000,000	42.8
1920	1,319,000,000	45.3
1921	* 1,134,600,000	40.4
1922	* 1,225,500,000	35.3
1923	* 1,359,900,000	43.9
1924	* 1,354,300,000	38.3

\* Revised from earlier reports to conform with more accurate information on certain of the warring countries.

The term "coal" as here used includes lignite, and the production stated for the world is simply the total quantities reported, no attempt being made to reduce the statistics for inferior coals to an equivalent tonnage of coals of higher rank. Where possible, however, coal and lignite are shown separately.

In comparison with 1923, the total for the year 1924 showed a decrease of 5,600,000 metric tons. The largest decrease recorded was for the United States, amounting to over 78,000,000 tons. Other decreases of note were for Great Britain, 9,000,000 tons, and Poland, 4,000,000 tons. In several European countries there were some marked increases. The output of coal in Germany, amounting to 118,829,000 tons, exclusive of that mined in the Saar basin, was about double that in 1923. The increase in the Saar fields was nearly 5,000,000 tons, in France 6,400,000 tons, while Czechoslovakia had increased over 1923 in coal and lignite amounting to 2,800,000 and 4,200,000 tons, respectively.

The table on page 164, prepared by L. M. Jones, of the Bureau of Mines, is based on the best estimates of the year available.

At the end of the year the United States Bureau of Mines of the Department of Commerce estimated the total production of bituminous coal for the United States for the calendar year at 523,072,000 net tons. This estimate, which is prepared at the end of the year, according to the Bureau was subject to a possible error of from 1 to 2 per cent, but is given in comparison with the final figures of production as reported by the operators in the following table:

## ESTIMATED UNITED STATES PRODUCTION OF BITUMINOUS COAL [Net tons]

Period	Production	Average per working day
Calendar year:		
1925	523,072,000	1,702,000
1924	483,687,000	1,573,000
1923	564,565,000	1,845,000
1922	422,268,000	1,380,000
1921	415,922,000	1,356,000
1920	568,667,000	1,847,000

The Bureau of Mines at the end of the year estimated the total production of anthracite at 62,120,000 net tons, showing a decrease of 25,807,000 tons, or 29 per cent, and 31,219,000 tons, or 33 per cent as compared with 1924 and 1923. This, of course, was due to the cessation of work on Sept. 1, 1925, as a result of the anthracite coal strike which continued during the re-

a Estimate included in total.

b Includes a small quantity of asphaltite.

c Exclusive of the output of the State of Falcon (about 8000 tons), for which estimate is included in total.

d Includes entire output of Upper Silesia for January-May, inclusive; for June-December, inclusive, only that part of the Province allocated to Germany.

e Includes the output June-December, inclusive, of that part of Upper Silesia allocated to Poland.

f Russia in Asia included under Russia in Europe.

g Data for operating year, Oct. 1, 1923, to Sept. 30, 1924.

Prepared by L. M. Jones, Bureau of Mines. Jan. 16, 1926.

mainder of the year, there being practically no mining carried on in Pennsylvania for this reason. The accompanying table from the Bureau of Mines presents the total output of anthracite in 1925, 1924, and 1923; and for comparison, output during the first eight months of each of the three years. It will be noted that during the period Jan. 1 to Aug. 31, 1925, 61,621,000 net tons of anthracite were produced, or an increase of 4.0 per cent over that of the corresponding period in 1924, and a decrease of 7.9 per cent in that of the same period in 1923.

PRODUCTION OF ANTHRACITE IN 1925,  
1924, AND 1923  
[Net tons]

	First 8 months (January-August)	Total for calendar year

\* Figures for bituminous coal exclude output of wagon mines.

<sup>b</sup> Figures revised from weekly estimates as published currently in 1925 in light of additional data later received.

<sup>c</sup> Includes production of Alaska, California, Georgia, Idaho, Nevada, North Carolina, Oregon, and South Dakota, whenever reported, although not all of these States produced coal in each year shown. In 1925 the group does not include estimate for Alaska. Early estimates place production at about 75,000 tons.

In Great Britain the wage basis of May, 1924, expired on July 31, and as it was impossible to renew this arrangement or for the representatives of the coal owners and the coal laborers to agree as to the underlying causes of conditions in the industry or means of their correction, the British government appointed the Royal Commission, at the same time offering to meet, out of the government funds, for almost nine months the costs necessary to continue the former wage agreement. A group of outside experts were duly appointed to the Commission,

which after organization, visited representative mines in each district so as to familiarize themselves with the essential layouts and the technical features that would be brought out in the expert testimony. In the middle of October hearing of testimony began, after 11 of 39 weeks had been devoted to the preliminaries of organization. This involved the drawing upon some £10,000,000 of the subvention. In the course of these hearings it was brought out that while coal was of the greatest importance in the iron and steel industry, it was being displaced as a fuel by oil, especially in ships and by light engines. See STRIKES AND LOCK-OUTS.

COCAINE, SYNTHETIC. See CHEMISTRY, INDUSTRIAL.

COCHIN-CHINA, kō'chin-ch'na. The southernmost colony in French Indo-China (q.v.). The area is estimated at 26,476 square miles, divided into 20 provinces. In 1921 the population was put at 3,978,899, consisting chiefly of Annamites, Cambodians, Moïs, Chams, and Chinese, with a few Indians, Malays, Tagels, and foreigners. The Europeans exclusive of the military numbered 11,225 French and 644 others. The capital is Saigon, with a population in 1921 of 111,632 of whom 9553 were Europeans, exclusive of 1109 troops. Cholon has a population of 217,209, of whom 114,123 are Chinese. According to recent statistics there were 867 schools with 1325 teachers, and 51,452 pupils. Over 80 per cent of the cultivable land is devoted to rice, which is the principal product and the largest item of export. The rice crop for 1924 was estimated at 2,134,474 metric tons, of which 1,239,116 tons were available for export. Other crops are maize, beans, rubber, sugarcane, earth-nuts, tobacco, coffee, fruits, etc. Other sources of income are livestock and fishing. The fishery products are valued at 2,800,000 francs annually. According to the most recent figures the ten rice mills in Saigon and Cholon turn out from 450 to 900 tons a day. There were also in these cities two sawmills, two soap factories, and a varnish factory. Commerce is largely in the hands of the Europeans and Chinese although the Annamites are traders on a small scale. During 1923, 747 steamers of 1,600,384 tons entered the port of Saigon; in the same year 752 vessels of 1,608,254 tons cleared. The total exports in 1923 amounted to 793,402,000 francs and the imports, 802,675,000 francs. The local budget for 1924 balanced at 13,598,690 piastres. Cochin-China is ruled directly by a governor and council of 24 members. It is represented in France by one deputy.

CODIFICATION, LAW. See INTERNATIONAL LAW.

COE COLLEGE. An institution of higher learning at Cedar Rapids, Iowa; founded in 1881. The 1925 fall term enrollment was 937, that of the 1925 summer school 385, while the extension department registered 151, the total of which, together with 87 in public speaking, and 187 in the music department, amounted to 1747 for the year 1925. There were 76 members on the faculty. The productive funds of the institution amounted to \$1,350,000. By Nov. 1, 1925, the women's athletic field and field house were completed, the latter a \$12,000 gift from the alumni. The library contained 28,439 volumes. President, Harry Morehouse Gage, D.D., LL.D.

## VALUES OF FOREIGN COINS

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks	
Argentine Republic ..	Gold	Peso .....	\$0.9648	Currency: Paper, normally convertible at 44 per cent of face value; now inconvertible.	
Austria .....	Gold	Shilling .....	.1407		
Belgium .....	Gold and silver	Franc .....	.1930	Member Latin Union.	
Bolivia .....	Gold	Boliviano .....	.3893	12½ bolivianos equal 1 pound sterling.	
Brazil .....	Gold	Milreis .....	.5462	Currency: Government paper a part of which is legally convertible at 16 pence (= \$0.3244) per milreis; now inconvertible.	
British Colonies in Australasia and Africa ..	Gold	Pound sterling ...	4.8665		
British Honduras ..	Gold	Dollar .....	1.0000		
Bulgaria .....	Gold	Leva .....	.1930		
Canada .....	Gold	Dollar .....	1.0000		
Chile .....	Gold	Peso .....	.8650		
China .....	Silver	Tael	Amoy .....	.8287	Currency: Inconvertible paper.
			Canton .....	.8262	
			Cheefoo .....	.7926	The tael is a unit of weight, not a coin. The customs unit is the Haikwan tael. The values of other taels are based on their relation to the value of the Haikwan tael.
			Chin Kiang .....	.8095	
			Fuchau .....	.7666	The Yuan silver dollar of 100 cents is the monetary unit of the Chinese Republic; it is equivalent to .644 + of the Haikwan tael.
			Haikwan (customs) .....	.8432	
			Hankow .....	.7754	
			Kiaochow .....	.8030	
			Nanking .....	.8200	
			Niuchwang .....	.7771	
			Ningpo .....	.7968	
			Peking .....	.8079	
			Shanghai .....	.7570	
			Swatow .....	.7655	
			Takau .....	.8339	
			Tientsin .....	.8030	
		Dollar	Yuan .....	.5370	
			Hongkong .....	.5450	
			British .....	.5491	
			Mexican .....	.5491	Mexican silver pesos issued under Mexican decree of Nov. 13, 1918, are of silver content approximately 41% less than the dollar here quoted; and those issued under decree of Oct. 27, 1919, contain about 51% less silver.
Colombia .....	Gold	Peso .....	.9733	Currency: Government paper and silver.	
Costa Rica .....	Gold	Colon .....	.4653	Law establishing conversion office fixes ratio 4 colons = \$1 U. S.	
Cuba .....	Gold	Peso .....	1.0000		
Denmark .....	Gold	Krone .....	.2680		
Dominican Republic ..	Gold	Dollar .....	1.0000	U. S. money is principal circulating medium.	
Ecuador .....	Gold	Sucre .....	.4867		
Egypt .....	Gold	Pound (100 piasters)	4.9431	The actual standard is the British pound sterling, which is legal tender for 97½ piasters.	
Estonia .....	Gold	Kroon .....	.2680		
Finland .....	Gold	Markka .....	.1930		
France .....	Gold and silver	Franc .....	.1930	Member Latin Union.	
Germany .....	Gold	Reichsmark .....	.2382		
Great Britain .....	Gold	Pound sterling .....	4.8665	Member Latin Union.	
Greece .....	Gold and silver	Drachma .....	.1930		
Guatemala .....	Gold	Quetzal .....	1.0000	Currency: National bank notes redeemable on demand in American dollars.	
Haiti .....	Gold	Gourde .....	.2000	Currency, bank notes.	
Honduras .....	Silver	Peso .....	.5055	The British sovereign and half sovereign are legal tender in India at 10 rupees per sovereign; actual exchange rates approximate 15 rupees.	
India [British] .....	{ Gold Silver	{ Sovereign Rupee	{ 4.8665 .2401		
Indo-China .....	Silver	Piaster .....	.5459		
Italy .....	Gold	Lira .....	.1930	Member Latin Union.	
Japan .....	Gold	Yen .....	.4985		
Latvia .....	Gold	Lat .....	.1930		
Liberia .....	Gold	Dollar .....	1.0000	Currency: Depreciated silver token coins. Customs duties are collected in gold.	
Lithuania .....	Gold	Litas .....	.1000	Currency: Notes of the bank of Lithuania, not now convertible.	
Mexico .....	Gold	Peso .....	.4985		
Netherlands .....	Gold	Guilder (florin) ..	.4020		
Newfoundland .....	Gold	Dollar .....	1.0000		
Nicaragua .....	Gold	Cordoba .....	1.0000		
Norway .....	Gold	Krone .....	.2680		
Panama .....	Gold	Balboa .....	1.0000		
Paraguay .....	Gold	Peso (Argentine) ..	.9648	Currency: Depreciated Paraguayan paper currency.	
Persia .....	Silver	Kran .....	.0931	Currency: Silver circulating above its metallic value. Gold coin is a commodity only, normally worth double the silver.	
Peru .....	Gold	Libra .....	4.8665		
Philippine Islands ..	Gold	Peso .....	.5000		
Poland .....	Gold	Zloty .....	.1930		
Portugal .....	Gold	Escudo .....	1.0805	Currency: Inconvertible paper.	
Rumania .....	Gold	Leu .....	.1930		

## VALUES OF FOREIGN COINS—Continued

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks
Russia .....	Gold	Ruble .....	.5146	
Salvador .....	Gold	Colon .....	.5000	
Siam .....	Gold	Tical .....	.3709	
Spain .....	Gold and silver	Peseta .....	.1930	Valuation is for gold peseta; currency is notes of the bank of Spain.

**COINS, VALUES OF FOREIGN.** The legal estimates of the values of foreign coins on Jan. 1, 1926, as issued by the Secretary of the Treasury are given in the table.

**COKE.** At the end of 1925 there were 80 by-product coke plants in the United States, of which 74 were active during December, and the production was the highest of record for any single month, in fact it was estimated at 3,760,000 net tons, as compared with 1,307,000 for beehive coke, or a total of 5,067,000, as compared with the monthly average for 1925 of 4,225,000, of which 3,332,000 tons were by-product coke and 893,000 were beehive coke. The by-product coke output for 1925 was estimated at 10,518 000 tons. In December 7,465,000 tons of coal were consumed in coke manufacture, of which 5,403,000 tons were in by-product ovens and 2,062,000 were in beehive ovens. Of beehive coke, the total production for the year was estimated at 10,713,000 tons, as compared with 10,286,000 net tons in 1924, and 19,380,000 net tons in 1923.

In the following year specializing in political science, he received the degree of A.M., and 1890-91 he was acting professor of history at Amherst College. From 1891 to 1895 he was lecturer on history at Columbia College and instructor in history and economics at Barnard College. From 1895 to 1900, when he retired from educational work, he was professor of economics at New York University. His long and important career as editor of reference works began in 1893, when Colby became a member of the Editorial Staff of *Johnson's Cyclopaedia*, serving with that organization until 1895. In 1898 when THE INTERNATIONAL YEAR BOOK was founded he became its editor, serving in that capacity and with the subsequent NEW INTERNATIONAL YEAR BOOK, until his death, developing the latter work to its present position of character and influence. He became one of the editors of the INTERNATIONAL ENCYCLOPEDIA and also was one of the editors of the NEW INTERNATIONAL ENCYCLOPEDIA when that work first was published, 1900-1903. He supervised the preparation of the Second Edi-

**COLBY, FRANK MOORE.** American editor and writer, died in New York March 3. He was born at Washington, D. C., Feb. 10, 1865, and graduated from Columbia University in 1888.

tion, 1913-15, and was also the editor of the SUPPLEMENT brought out in 1924. Colby was the American editor of *Nelson's Encyclopaedia* when first published, 1905-6. On all of these

works he left his imprint not only as an organizer, and editor but also as an accurate scholar and critic of breadth and discrimination.

In addition to his connection with reference works, Colby from 1900-02 was an editorial writer for the *New York Commercial Advertiser* and later a staff writer or contributor to the *Bookman*, *Harper's Weekly*, *New Republic*, *Vanity Fair*, *North American Review*, *Harper's Magazine*, and other magazines, where his reviews, criticisms and essays were well received and provoked no little discussion. Some of this material later was included in such volumes of essays as *Imaginary Obligations* (1904); *Constrained Attitudes* (1910); *The Margin of Hesitation* (1921); and a later volume of essays published posthumously. Previously in 1900 he had published *Outlines of General History*. Colby's essays have a quaint and delicate irony, yet are marked by a good nature and sincerity entirely characteristic of the author. His satire is sane, wholesome and refreshing, while his writings show keen wit and wisdom. His literary taste found expression in connection with such books of reference as encyclopedias and other reference books edited by him, where his scholarship was reflected in their accuracy, comprehensive scope and general style. He exerted no small influence in raising the general standard of this kind of literature for American readers.

**COLDS IN THE HEAD.** While the supposed ability of chlorine fumes to prevent colds is no new claim the treatment of this affection by the same means appears to date from a paper presented to the Minnesota State Medical Association last spring by Vedder and Sawyer. The importance of the subject is less for the comfort of the individual than for the economic loss to business through the absence of employees from work. Even should the treatment prove a disappointment some good will have been accomplished, for a satisfactory mass study of colds seems never to have been properly conducted before. The reports of the use of the gas on a large scale are more or less conflicting and we may select one at random to demonstrate the problems involved—that by Dr. H. S. Diehl on the results of the treatment on students at the University of Minnesota. One great advantage of a gas treatment is that it may be administered simultaneously to a large number of patients, although Dr. Diehl limited the number to eight or 10 at a time, because a small room is better suited to obtain the desirable concentration of gas. The number of students with colds was 425 and about 20 per cent recovered with one day's treatment, which is a larger figure than that obtained by ordinary treatment, although the difference is not impressive. If however we select only the very recent colds the percentage is notably higher. However less than one patient in four had his fresh cold aborted by the gas. About half of those treated with the gas were over their colds by the end of three days but the results were almost as good under the usual forms of treatment. The results at the end of a week were the same in both cases. The net result, if these figures are confirmed, is that a man with a new cold can have it aborted once in four times by chlorin inhalation while without it and under other plans of treatment he can expect such a result once in about fifteen times. If the cold is more than one day old it

does not appear that chlorin has much superiority over other measures of treatment.

**COLE, SAMUEL VALENTINE.** President of Wheaton College, died at Norton, Mass., May 6. He was born at Machiasport, Me., Dec. 29, 1851, and graduated from Bowdoin College in 1874, subsequently receiving the degree of A.M. in 1877. He graduated from Andover Theological Seminary in 1887, and two years later was ordained and installed as pastor of Trinitarian Congregational Church at Taunton, Mass., serving until 1897 when he became president of Wheaton Seminary at Norton, Mass., which in 1912 was succeeded by Wheaton College of which he was president. He was honored with the degree of D.D. by Bowdoin College in 1898 which also conferred upon him the degree of LL.D. in 1912. He wrote commemorative poems for the centennial celebration of Bowdoin College, 1902; at the Jonathan Edwards bi-centenary celebration; at the Andover Theological Seminary, 1903; and at the Longfellow Centenary of Bowdoin College, 1907. He was the author of *In Scipio's Gardens and Other Poems* (1901); *The Life That Counts* (1905); *Fidelissima* (1908); and *The Great Grey King and Other Poems* (1914).

**COLGATE UNIVERSITY.** A non-sectarian institution of higher education at Hamilton, N. Y.; founded in 1819. The number of students enrolled in the fall of 1925 was 852. There were 63 members on the faculty. The productive funds amounted to \$4,077,577.21, and the income for the year, \$386,373.13. During the year a new gymnasium was completed at the approximate cost of \$350,000. A new recitation hall was started, estimated to cost \$400,000. The library contained 105,000 volumes. President, George Barton Cullen, Ph.D., D.D., LL.D.

**COLLEGES.** See UNIVERSITIES AND COLLEGES.

**COLOM'BIA.** A South American Republic in the northwestern part of the continent. Capital, Bogota.

**AREA AND POPULATION.** The area is estimated at 440,846 square miles; population at the census of Oct. 14, 1918, 5,855,077. The capital, Bogota, had a population according to the census of 1918, of 143,994, and estimated in October, 1923, at 166,148. The country is divided into 14 departments, three intendencias, and six commissionerships. Other important towns with their populations in 1918 are: Barranquilla, 64,543; Medellin, 79,146; Cartagena, 51,382; Cali, 45,825; and Manizales, 43,203.

**EDUCATION.** Education is free but not compulsory. In 1923 there were 7089 primary schools with 361,094 pupils. In the same year there were 97 public and 237 private secondary schools, 19 public and 11 private vocational schools, and five art schools. The University of Bogota (founded in 1572, and the School of Mines at Medellin are national institutions.

**PRODUCTION, ETC.** Coffee, bananas, cacao, hides, gold, platinum, and oil are the chief products. In the plateau region of which Bogota, the capital, is the centre the chief agricultural products are wheat and coffee. Only a small part of the soil is cultivated although a large area is fertile. Absence of adequate means of transportation prevents production on a large scale. Other important products besides wheat and coffee are tobacco, cotton, vegetable ivory, ivory nuts, dyewoods, corn, bananas, and rubber. Mineral resources are rich and gold is found in all departments, the number of

known gold mines being upwards of 18,000. Other minerals include lead, copper, mercury, platinum, cinnabar, manganese, emeralds, iron ore, salt, etc., but they have not been developed to any great extent. Oil production in 1923 amounted to 523,696 barrels. Early in 1925 the construction of a pipe line from the Baranca Bermeja oil fields to the Caribbean was expected to be pushed and thus give an outlet for the country's petroleum. Production was largely confined to domestic needs as there were no adequate facilities for exporting petroleum.

**COMMERCE.** The principal articles of export are coffee, hides, bananas, gold, silver, and platinum. The principal articles of import are foodstuffs, drugs, metals, and cotton goods. In 1923 the exports were valued at £13,171,291 and the imports at £11,623,458. The accompanying table from the *Pan American Union* shows the value of the foreign export trade for 1924, when 373,198,456 kilos valued at 70,466,735.94 pesos as compared with 329,931,903 kilos valued at 60,115,435.20 pesos in 1923.

<i>Customhouse</i>	<i>Kilos</i>	<i>Pesos</i>
Arauca .....	854,319	74,633.65

Tumaco .....	7,698,087	889,768.03
Total .....	373,198,456	70,466,735.94

**FINANCE.** The budget for 1924 called for a revenue of 38,285,396 gold pesos and an expenditure of 42,965,953 gold pesos; that for 1925 estimated a revenue of 34,441,655 gold pesos and an expenditure of 38,150,655. The chief items of expenditure in 1924 were: Treasury, 13,928,031 pesos; Public Works, 12,927,377 pesos; War, 3,031,597 pesos; Posts and Telegraphs, 3,650,430 pesos; and Public Health and Instruction, 2,699,041 pesos. The external debt on May 1, 1923, amounted to £4,495,521 and the internal debt was 2,848,260 gold pesos.

**COMMUNICATIONS.** The total length of railway in Colombia in 1923 was 1054 miles. During the year the concession of the Colombian Northern, a short narrow-gauge railway operated by a British corporation, was canceled and its property was taken over by the Colombian government. Although this concession was received in 1884 the line was not completed until 1898 and in the meantime there had been a number of alterations in the original concession which the government claimed were illegal and on this view based their seizure of the property. In the latter part of July, 1925, the first 50 kilometers of the railroad from Puerta Wilches, a Magdalena River port, to Bucaramanga, were opened. The work on the rest of the road was progressing rapidly, the road bed having been leveled to kilometer 75 and other preliminary work to kilometer 108, that is to say within 20 kilometers of the city of Bucaramanga, capital of the Department of Santander. Once this railroad is completed it will be an important factor in the development of this department, which is a great coffee and agricultural centre.

During 1925 the total mileage of the Colombian railways was increased to 1109 miles, the

work being made possible by the American indemnity fund, which was practically all expended during the year. This new construction was not confined to the main lines, but there were various projects throughout the country and it was a question how soon the government would be able to complete the various projects already started. There was under consideration during the year the construction of a railway from Baranquilla to Cartagena, as the only means of communication between these two important cities was by water from Puerto Colombia to Cartagena, or else by rail via Calamar. The railways of Colombia had one of their best years on the score of finance and the operating revenues on the principal lines showed a slight increase.

**GOVERNMENT.** The executive power is vested in a president elected for four years by direct popular vote, and legislative power in a congress of two houses; the senate of 34 members, elected indirectly, and the house of representatives with 92 members elected by popular vote. President at the beginning of 1925, Gen. Pedro Nel Ospina, elected Feb. 10, 1922, who assumed office August 7th of that year.

**HISTORY.** In April an abortive attempt was made to overthrow the government of President Nel Ospina. While he was on a tour of the provinces, a group of army officers plotted his downfall. The movement, which was frustrated by his unexpected return to the capital, was caused by an investigation of the War Department by congress, which was strongly resented by the military. On April 27 the cabinet resigned because of the failure of congress to ratify the Colombian-Peruvian treaty. See BRAZIL, *History*. On July 24, M. Savinsky, the head of the Communist Society of Colombia and Ecuador, was banished from the country because of his activities against the legitimate authority of the Colombian government.

**COLORADO. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 939,629. The estimated population on July 1, 1925, was 1,019,280. The capital is Denver.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925 as estimated by the U. S. Department of Agriculture.

<i>Crop</i>	<i>Year</i>	<i>Acreage</i>	<i>Prod. bu.</i>	<i>Value</i>
Corn	1924	1,450,000	14,500,000	\$12,760,000
	1925	1,494,000	22,410,000	15,687,000
Barley	1924	327,000	6,540,000	4,709,000
	1925	410,000	8,610,000	4,994,000

	1925	86,000	14,190,000	21,994,000

\* tons.

**MINERAL PRODUCTION.** The output of gold, silver, copper, lead, and zinc from Colorado ores in 1925 in terms of recovered and estimated recoverable metal was: \$7,205,000 in gold, 4,380,000 ounces of silver, 2,500,000 pounds of copper, 63,000,000 pounds of lead, and 61,000,000 pounds of zinc, according to the U. S. Bureau of Mines, Department of Commerce. These figures are to be compared with \$8,593,116 in gold, 3,254,370

ounces of silver, 2,713,219 pounds of copper, 47,557,061 pounds of lead, and 56,727,000 pounds of zinc in 1924. There is an increase of 34 per cent in the production of silver in 1925, 32 per cent in the production of lead, and 7½ per cent in the output of zinc. The production of gold declined 16 per cent, and the copper production showed a loss of 8 per cent. At estimated average prices for silver, copper, lead, and zinc, at the end of the year, the value of the output of these metals in 1925 was silver, \$3,022,000; copper, \$353,000; lead, \$5,708,000; and zinc, \$4,636,000. These values together with that for gold give a gross value of the output of \$20,924,000 for 1925, as compared with \$18,620,796 for 1924, an increase of about \$2,303,000 or 12 per cent.

The production of coal, in 1924, was 10,444,098 short tons, valued at \$31,863,000, compared with 10,346,218 short tons valued at \$33,299,000 in 1923. The clay products, in 1923, were valued at \$4,413,602, compared with a value in 1922 of \$3,431,197. Other important mineral products are mineral paints, stone, tungsten ore, sand and gravel. The total value of mineral production in 1923 was \$81,379,146, compared with a value in 1922 of \$54,806,277.

**FINANCE.** According to the summary of the United States Department of Commerce, the total expenditures for maintenance and operation of the general departments of the State for the fiscal year ended Nov. 30, 1924, amounted to \$10,446,065. Interest on the debt and outlays for permanent improvements, brought the total payments for all purposes to \$17,646,562. The per capita payments for maintenance and operation in 1924 amounted to \$10.41, compared with \$9.89 in 1923, and \$5.53 in 1917. The largest single expenditure was for the construction and maintenance of railways.

The total revenue of the State for 1924 amounted to \$16,065,017, or \$5,128,634 more than the total payments of the year, exclusive of the payments for permanent improvements. It was, however, \$1,581,545 less than the total payments, including those for permanent improvements. The excess payments were met from the proceeds of debt obligations. Of the total revenue for 1924, 45.9 per cent was represented by property and special taxes; compared with 52.4 per cent in 1923, and 56.9 per cent in 1917. The per capita property and special taxes in 1924 were \$7.35, compared with \$7.99 in 1923, and \$3.23 in 1917. The chief sources of revenue, in addition to the property and special taxes, were earnings of the general departments, and business and non-business licenses.

The total net indebtedness of the State on Nov. 30, 1924, was \$11,338,684, or \$11.30 per capita, compared with \$10.85 in 1923 and \$5.02 in 1917. The assessed valuation of property in 1924 was \$1,540,500,479. The State taxes levied amounted to \$5,699,850, or \$5.68 per capita.

**TRANSPORTATION.** The railway mileage at the end of 1924 was 5188.3.\* There was no new construction during 1925. About 8 miles of the Chicago and Southern Railway were discontinued during the year.

**MANUFACTURES.** According to the summary of the biennial census, of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$255,183,000, com-

pared with \$221,324,000 in 1921 and \$275,622,335 in 1919. The average number of wage earners employed during 1923 was 31,226, compared with 27,625 in 1921 and 44,729 in 1919. The operation of steam-railroad repair shops provided employment for the greatest number of wage earners, but measured by the total value of products, the beet-sugar industry was the most important. This industry employed 3407 wage earners in 1921 and 1820 in 1923, and the value of the product was \$39,558,657 in 1921 compared with \$30,165,810 in 1923. The number of establishments whose output was \$5000 or more, decreased from 1491 in 1921 to 1377 in 1923.

**EDUCATION.** There was a rapid increase during the year in the spirit of professionalism. This was shown notably in the largely increased enrollment in the State Association, in spite of an increase in the membership fee.

The total school population of the state in 1924 was 297,934; and the total enrollment, including 11,184 in the night schools, was 247,195. The enrollment in the grade schools for 1924 was 187,452, and in the high schools, 48,559. The average monthly salaries paid to men teachers, in 1924, was \$138.78, and to women teachers, \$125.43. The expenditures for education during the year amounted to \$21,049,104.

**CHARITIES AND CORRECTIONS.** The State Board of Charities was abolished in 1923 and all powers previously exercised by it were placed in the hands of the secretary of the board under the direction of the Governor. The institutions include the State Reformatory and Penitentiary, State Hospital, several schools for defectives, industrial schools, and a School for the Deaf and Blind. A new State Psychopathic Hospital was completed in 1924, and was put in operation in 1925. The legislature of 1925 created a State Commission for the Blind which has control of the appropriations for the blind and the State workshop. A law was also passed regulating maternity hospitals, and giving the Board of Health power to make and enforce rules.

**LEGISLATION.** A measure was enacted directing the giving of instruction on the Constitution of the United States in all public and private schools. The State Commission for the Blind was created which was to control the State appropriations for the blind and the State workshop. It was made a felony punishable by imprisonment to own or operate a still for the manufacture of intoxicating liquors. A measure was enacted providing that only citizens can be jurors, striking out those who had declared their intention only. Provision was made also that no persons who cannot speak or understand English shall be eligible to serve as jurors. Formerly persons speaking the Spanish or Mexican language could serve in this capacity.

**POLITICAL AND OTHER EVENTS.** The State legislature met in its regular session in 1925. The year was a quiet one in politics in the State. There were no important elections or other notable political events. Some attention was attracted in July to disruption in the ranks of the Ku Klux Klan of the State, due to dissatisfaction of the national officers of the Klan with the local officers. Officials of the national organization requested the resignation of Dr. John Galen Locke, Grand Dragon of Colorado.

At a meeting of the local Klan he announced his resignation. The members present greeted him with great enthusiasm and refused to accept the resignation. Following this, Rice W. Means and Benjamin F. Stapleton, mayor of Denver, were suspended from the Klan on the alleged charge that they had organized a plot to unseat Locke and make Senator Means Grand Dragon. Following this, H. W. Evans, Imperial Wizard of the Klan, directed the Colorado Klan to hold all its funds and property subject to his orders. This included a \$60,000 interest in a cotton mill. Against this order, the local Klansmen protested and many turned in their membership cards and took out membership in the "Minute Men of America," which is described as an organization similar in ideals to the Klan. As a result of this dissension, Carl S. Milliken, Secretary of State, addressed a letter to the Klan formally declining his membership. He declared that he did this because the Klan had attempted to dictate to him the removal of a deputy secretary of state, a son-in-law of the Internal Revenue Collector in Denver, who had investigated the income tax returns of the Grand Dragon of the Colorado Klan.

**OFFICERS.** Governor, C. J. Morley; Lieutenant-Governor, S. B. Lacy; Secretary of State, C. S. Milliken; Treasurer, W. D. McGinnis; Auditor, Charles Davis; Attorney General, W. L. Boatright; Superintendent of Public Instruction, Mary C. C. Bradford.

**JUDICIARY.** Supreme Court: Chief Justice, James H. Teller; Associate Justices: John Campbell, George W. Allen, Haslett P. Burke, John H. Denison, Greeley W. Whitford, and John W. Sheafor.

**COLORADO, UNIVERSITY OF.** A coeducational State institution of the higher education at Boulder, Col.; founded in 1876. For the 1925 fall term a total of 2654 students was enrolled, and the 1925 summer quarter had a registration of 3520 students. There were 159 members, excluding the assistants, on the faculty. The total income from State, fees, tuition, etc., was estimated approximately at \$1,000,000 for general maintenance. For operation of hospitals, including fees, approximately \$250,000 was received, and for new buildings \$80,000. In 1925 an addition to the Chemistry building was under construction estimated to cost about \$250,000. In the library there were 161,170 volumes, 17,000 pamphlets, and 2380 maps. President, George Norlin, Ph.D., LL.D.

**COLUMBIA UNIVERSITY.** A nonsectarian institution of the higher learning, founded in 1754, whose principal schools at Morningside Heights, New York City, comprise: Columbia College (college of liberal arts for undergraduate men); School of Law; Schools of Mines, Engineering and Chemistry; School of Architecture; the non-professional graduate faculties of political science, philosophy and pure science; Barnard College (college for undergraduate women); Teachers College, including the departments of education and practical arts; School of Journalism; School of Business; and the University Library. The

College of Physicians and Surgeons is on West 59th Street, the College of Pharmacy on West 68th Street, and the School of Dental and Oral Surgery on East 35th Street. In addition to the regular session, there is a thorough system of extension teaching; and in the summer, besides the summer session at Morningside Heights, a summer camp for engineering students at Morris, Conn.

According to President Butler's annual report for 1925, the gross total of resident students was 37,606 and the net total 34,823. The undergraduate students totaled 3083, distributed as follows: Columbia College, 2016; Barnard College (for women), 978; University undergraduates, 89. The graduate and professional students totaled 10,523, distributed as follows: political science, philosophy and pure science, 2264; architecture, 82; business, 380; dentistry, 379; journalism, 156; law, 710; medicine, 406; mines, engineering and chemistry, 209; pharmacy, 852; Teachers College, education, 2900; practical arts, 1999; unclassified university students, 186. The summer session in 1924, including undergraduate, graduate, professional, and unclassified students had an enrollment of 12,916. The summer session for 1925 enrolled 12,720 students. The net registration of the University extension courses (regular) was 11,084. The non-resident students numbered 5041, distributed as follows: extramural courses, 2199; home study courses, 1854; special courses, 988. The teaching staff of the University inclusive of the summer and extension sessions but exclusive of nine administrative officers and emeritus and retired officers numbered 1898. The appointments to full professorship in the University were as follows: Charles C. Hyde, LL.D., Hamilton Fish Professor of International Law and Diplomacy; Harry D. Kitson, Ph.D., Professor of Education (Teachers College); Robert A. Lambert, M.D., Professor of Pathology and Director of the School of Tropical Medicine; Helen T. Woolley, Ph.D., Professor of Education and Director of the Institute of Child Welfare Research (Teachers College); Edwin G. Zabriskie, M.D., Professor of Clinical Neurology. Among the deaths of the officers of the University during 1925 may be mentioned the following: William Carr, D.D.S., Honorary Director of the School of Dental and Oral Surgery; Thomas F. Carter, A.B., Assistant Professor of Chinese; Charles F. Chandler, M.D., LL.D., Sc.D., Mitchell Professor Emeritus of Chemistry; John A. Fordyce, M.D., Professor of Dermatology and Syphilology; Edward L.H. McGinnis, M.D., Associate in Radiotherapy; Katherine E. McMahon, Ph.B., Instructor in Journalism; Gordon Nilsson, A.B., Instructor in English; and Henry A. Todd, Professor of Romance Philology. The capital endowment (including Barnard College, Teachers College, and the College of Pharmacy) amounted to \$57,456,803.03 and the gross income (1924-25) was \$9,521,790.94. The estimated value of property occupied for educational purposes (university land, buildings, and equipment, including the three above mentioned colleges, was \$35,706,125.16. The annual budget for 1925-26 amounted to \$10,196,710.72. Among the gifts to the University were the following: \$558,185.87 from the Trustees of the Trust of William S. Tod, to be added to the John Stewart Kennedy Endowment Fund; \$350,-

000 from the estate of Joseph R. DeLamar, to be added to the DeLamar Endowment Fund; \$100,000 from an anonymous donor, for the endowment of the Department of Mining and Metallurgy; \$41,846.89 from the estate of Stephen Whitney Phoenix, to be added to the principal of the Phoenix Legacy; \$34,191.25 from the Carnegie Corporation, for the construction of the new Medical School buildings; \$24,329.38 from the estate of Dr. L. Emmett Holt, to establish a fellowship for the study of diseases of children; \$21,000 from the Alumni Federation of Columbia University, for the Permanent Alumni Fund. The total amount of gifts presented to Columbia University was \$1,329,500.81; to Barnard College, \$11,076.57; to Teachers College, \$746,182.54; and to the College of Pharmacy, \$10,348.33, making a grand total of \$2,097,108.25. The library contained 1,024,423 volumes and received many valuable additions during the year.

Among the important events of the year were the opening for use on Jan. 31, 1925, of Johnson Hall, the new residence hall for graduate and professional women students of the University; the construction of the new chemical laboratory; and the new physics laboratory buildings; the breaking of ground for the new medical school building on Jan. 31, 1925; and for the new Students' Hall, on Jan. 26, 1925. President, Nicholas Murray Butler, Ph.D., LL.D.

**CONGO, BELGIAN.** A colony of Belgium in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. The boundaries were defined by declarations of August, 1885, and December, 1894, and by treaties with Germany, France, Great Britain and Portugal. The area is estimated at 909,654 square miles. The native population is placed at approximately 8,500,000 (Bantu). The white population on Jan. 1, 1923, numbered 10,037, more than half of whom were Belgian. The chief city and former capital is Boma. By a royal decree of 1923 the capital was changed to Kinshasa, which was renamed Leopoldville. Other cities are: Elizabethville, Stanleyville, and Kookilhatville. Catholic and Protestant bodies carry on missionary work, the number of Catholic missionaries being 800 and of Protestants, 570. In cooperation with the government they supply means of education, and there are several educational institutions under direct government control, at the more important towns. In 1924, the total ex-

penditure on education was 5,749,700 francs.

**COMMERCE, FINANCE, ETC.** The total imports in special trade in 1922 were \$13,705,835 and the exports, \$11,783,173. The chief import in 1922 as in the preceding year was cotton goods (41,466,763 francs), and next in importance were machinery and provisions. The chief exports were palmnuts (49,261,053 francs), copper, copal, and palm oil. See **COTTON**. In the same year Belgium had the largest share of the trade and Great Britain and her African colonies stood next. In 1924 the revenues were 141,603,040 francs and the expenditures, 168,249,290 francs. The public debt on Dec. 31, 1923, was 543,410,235 francs. Expenditures regularly exceeded revenues with the result that loans frequently had to be resorted to for its service.

State steamers ply on the Congo in the navigable section from its mouth to Matadi, a distance of 95 miles, and government and private companies supply a transport service on the upper Congo and its tributaries. There are over 1000 miles of navigable water between Stanley Pool and Stanley Falls, and above Stanley Falls there is another navigable section of about 585 miles. The tributaries of the Congo are also navigable for a part of their courses. On Jan. 1, 1924, the railway mileage was placed at 1268 miles and the road mileage, partly suited to motor traffic was placed at 7125. Two sections of the Cape-to-Cairo railroad run through Belgian Congo, the distance from Elizabethville to Capetown on that line being 2300 miles.

**CONGO FREE STATE.** See **CONGO, BELGIAN**. **CONGO, FRENCH.** See **FRENCH EQUATORIAL AFRICA**.

**CONGREGATIONALISM.** A religious denomination founded in the United States by the Pilgrims in Plymouth, Mass., in 1620, under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency and as a result the essential elements of Separatism and Puritanism were combined into Congregationalism. In this denomination each church holds the right to frame its own statement of belief and the policy of the denomination as a whole represents adaptation to conditions rather than accord to a theory of church government. The National Council by which the administrative affairs of the church are carried on has no ecclesiastical authority but includes ministerial and lay delegates elected by the State conferences. The National Council meets biennially, the session in 1925 being held in May at Washington, D. C.

Statistics of the church for Jan. 1, 1925, showed 5680 churches, 5613 ministers, and a church membership of 878,995. The Sunday school enrollment was 787,564; Young People's Societies, 2953, with a membership of 119,478. The total raised for all benevolences was \$5,178,265, and the home expenses of the church were \$19,507,607. The National Benevolence Societies of the denomination are: American Board of Commissioners for Foreign Missions, Woman's Boards of Foreign Missions, American Missionary Society, Congregational Church Building Society, Congregational Education Society, Congregational Sunday School Extension Society, Congregational Foundation for Education, Con-

gregational Board of Ministerial Relief, and Congregational Woman's Home Missionary Federation.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in America, having been organized June 29, 1810. It conducts 17 different missions in 15 different countries; the stations connected with these missions number 112 and the outstations 1728. The missionaries holding life appointments are 718 and include 174 ordained men, 71 unordained, 229 wives, and 244 single women; besides, there are 100 associates who serve for shorter periods, making a total of 818 missionaries; 48 missionaries were appointed in 1923. Religious services are carried on in 2588 places where there are 614 organized churches with 89,848 communicants. The total constituency including church members and all influenced by missions numbers 252,740; there were 1282 Sunday schools and 66,706 pupils. In the educational field the board has 29 theological and training schools with 1412 pupils and 12 colleges with 2648 students; in addition it conducts many secondary and elementary schools, as well as 35 hospitals and 44 dispensaries. Expenditures of the board for the year ending Aug. 31, 1924, were \$2,263,837.41. The foreign fields include Turkey, China, Japan, India, Africa, Mexico, and the Philippines.

The field of the American Missionary Association extends from the Atlantic Coast to the Hawaiian Islands and Porto Rico. It includes, in the South, the Negroes and the Highlanders; in the West, the Indians; on the Pacific Coast, the Chinese, Japanese, and Filipinos; and recently work among the Latin Americans of the Southwest was transferred to it by the National Council. Statistics of the Society for 1924-25 show 213 churches, 13,169 members, 41 schools, and 8072 pupils. Expenditures in the same period amounted to \$840,562.97. The denomination conducts 10 theological seminaries, which in 1923 had a total enrollment of 690 students, 94 advance students, and 38 fellows, with a staff of 88 professors and 43 instructors and lecturers. The more important of these institutions are: Union Theological College, Chicago, Ill.; Yale Divinity School; Hartford School of Religious Pedagogy; and the Theological School at Harvard University. In addition there are 41 colleges, some of which are undenominational, but have historical relation to Congregationalism. The Home Missionary Society carried on its work in 1924 in 38 States and Territories, with 1367 missionaries under commission for the whole or part of the year. The chief foreign work was carried on among the German people, 71 churches and missions using that language in their service. During the year, 21 new churches were organized and 27 new church buildings erected. Receipts of the society during that year totaled \$370,508.29. The total receipts of the Church Building Society in 1925 were \$708,960. The contributions for church buildings were \$183,188; repaid grants and sales of abandoned churches amounted to \$99,284, and income from other sources \$172,725. The Board voted 229 church grants and loans and paid \$548,292 on 119 new churches and 32 parsonages.

The Woman's Board of Missions, the Woman's Board of the Interior, and the Woman's Board

of Missions for the Pacific form a Council which coöperates with the American Board and carries responsibility for the work among women and children in the same mission fields. Its educational work includes normal and kindergarten training and medical work. It supports numerous colleges, boarding and elementary schools and hospitals. A Pilgrim Fund was inaugurated in 1917, as a feature of the celebration of the Tercentenary of the landing of the Pilgrims; contributions in 1924 totaled \$469,957, making a total up to that time of \$5,212,418. The headquarters of the National Council are at 287 Fourth Avenue, New York City. In 1925-27, Mr. F. J. Harwood of Appleton, Wis., was Moderator of the Council; Rev. D. F. Bradley of Cleveland was Associate Moderator; Mrs. E. A. Osbornson, Chicago, Ill., and Rev. W. S. Cash, of New Orleans, La., were Assistant Moderators; Rev. Charles E. Burton, New York, was Secretary, and Franklin H. Warner, New York, was Treasurer. The publishing Society of the church maintains branches at 14 Beacon Street, Boston, and 19 South La Salle Street, Chicago. The accompanying table is reprinted from the *Congregational Year Book for 1924* showing statistics of international Congregationalism.

<sup>b</sup> Repeated from last Year Book.

**CONGREGATIONAL METHODISTS.** Two religious bodies in the United States, essentially Methodist in doctrine, but organized with a view to attain a greater degree of self-government than in the Methodist Episcopal Church. The Congregational Methodist Church, the older of these bodies, was formed at Forsyth, Ga., in May, 1852, by a group opposed in certain respects to episcopacy and itinerancy. It includes churches in most of the Southern States, and at some points in the North. Nearly one-third of the churches passed over to the Congregationalist group, 1887-88, and while some of these later returned, further losses have been reported in recent years. There are 13 State conferences, and a general conference is held every fourth year. In 1923 the denomination had 352

churches, 182 Sunday schools, and some 500 ministers and 21,000 members.

A second denomination, the New Congregational Methodist Church, was formed in Georgia in 1881, by a group opposing the action of the Georgia Conference of the Methodist Episcopal Church, South, in consolidating certain small churches. The body is Methodist in doctrine and Congregational in policy, and had in 1923 24 churches, 27 ministers and 1256 members.

#### CONGRESS. See UNITED STATES.

**CONNECTICUT. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,380,631. The estimated population on July 1, 1925, was 1,531,255. The capital is Hartford.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	55,000	2,365,000	\$2,888,000
	1925	57,000	2,850,000	3,135,000
Hay	1924	363,000	453,000 <sup>a</sup>	11,217,000
	1925	366,000	463,000 <sup>a</sup>	11,248,000
Potatoes	1924	15,000	1,950,000	1,950,000
	1925	15,000	2,025,000	5,062,000
Tobacco	1924	29,000	39,980,000 <sup>b</sup>	12,823,000
	1925	28,000	39,990,000 <sup>b</sup>	7,581,000

<sup>a</sup> tons, <sup>b</sup> pounds.

**MINERAL PRODUCTION.** Connecticut is not an important producer of minerals. In point of order of value, these are clay products, stone, lime, sand, and gravel. The clay products, in 1923, were valued at \$3,665,174, compared with a value of \$2,379,023 in 1922. The stone produced in 1923 was 1,482,710 short tons, valued at \$1,830,413. There were produced, in 1923, 59,158 short tons of lime, valued at \$813,254, compared with 52,108 short tons valued at \$743,742 in 1922. The estimated product in 1924 was 58,500 short tons, valued at \$797,000. The total value of the mineral products of the State in 1923 amounted to \$7,177,266, compared with a value of \$5,346,295 in 1922.

**FINANCE.** According to the summary of the United States Department of Commerce, the payments for maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1924 amounted to \$16,955,183. In addition there was expended for public service enterprises, interest on debt, and outlays for permanent improvements, \$6,817,794. The total payment, therefore, amounted to \$23,858,952. The per capita payments for maintenance and operation in 1924 amounted to \$11.38, compared with \$11.61 in 1923 and \$7.13 in 1917. The largest single expenditure of \$8,420,015 was for the construction and maintenance of highways.

The total revenue and receipts of the State for 1924 amounted to \$25,524,313, or \$7,826,290 more than the total payments of the year, exclusive of permanent improvements, and \$1,665,361 more than the total payments, including those for permanent improvements. Of the total revenue, 25.2 per cent was derived from property and special taxes. The per capita property and special taxes in 1924 amounted to \$4.81, compared with \$4.85 in 1923 and \$4.82 in 1917. The chief sources of revenue, in addition to property and special taxes, were from

earnings of general departments, and business and non-business licenses. The total indebtedness of the State on June 30, 1924, was \$4,631,574, or \$3.11 per capita. The per capita debt in 1923 was \$3.48 and in 1917, \$6.56.

**TRANSPORTATION.** The total mileage of the steam railways in the State in 1925 was 1004. There was no new construction during the year.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$1,288,293,000, compared with \$836,164,000 in 1921 and \$1,392,431,620 in 1919. The average number of wage earners employed during 1923 was 263,160 in 1923, 210,990 in 1921, and 338,033 in 1919. The "brass, bronze, and other nonferrous alloys, and manufactures of these alloys and of copper" industry is the leading one in the State, as measured either by number of wage earners or by the value of products. The average number of wage earners employed in this industry in 1923 was 23,000, and in 1921, 15,373; and the value of products amounted to \$164,368,000 in 1923, compared with \$65,795,000 in 1921 and \$169,550,000 in 1919. The number of establishments whose output was \$5000 or more, was 3130 in 1923.

**EDUCATION.** During the year a new course of study was promulgated by the State Board of Education and was widely adopted by towns and cities throughout the State. A monograph prepared by J. L. Meader, principal of the New Haven Normal School, served as a basis for the preparation of the course of study. Professional improvement of supervisors' instruction was the result of a series of clinics and conferences at which the work of the supervisor was observed and afterwards discussed.

The school population of the State, on September, 1924, was 362,177. The enrollment in the elementary schools was 249,036 and in the high schools, 35,933, making a total enrollment for the school year ending September, 1924, of 284,629. The expenditure for education in 1923-24 amounted to \$24,695,056. The average salaries for teachers, for the same period, was \$1,399.80 for elementary and \$1,905.59 for high school.

**CHARITIES AND CORRECTIONS.** The Department of State Agencies and Institutions has general charge of the charitable and correctional institutions of the State, which include the State Prisons, State Schools for Boys and Girls, and many sanitariums and other institutions in the cities of the State. The total expenditure of the department in 1925 was \$1,127,719. Of this, \$415,781 was expended for widows' aid.

**LEGISLATION.** Authority was given for the retirement by the Board of Control of persons who have had long service in the State at a salary equal to one-half their average salary for the preceding five years, except that in a few cases the salary is three-fourths. There was created a State Water Commission of three members. Street railway companies are permitted to substitute motor vehicles for street cars, with the consent of the Public Utilities Commission. A new aircraft law was enacted giving to the Commissioner of Motor Vehicles a new title of Commissioner of Aviation, and lodging with him control of the registration of

planes and pilots. Both persons are required to join in the statement on which a marriage license is issued instead of allowing one to make it, as formerly.

**POLITICAL AND OTHER EVENTS.** The State had the unique experience of having three governors in one day. Hiram Bingham, then lieutenant-governor, was elected governor in November, 1924. Six weeks later he was elected United States Senator to succeed Frank D. Brandagee, who died. Mr. Bingham announced his intention of being inaugurated governor, and then to immediately resign into the Senate. He took the oath of office on January 7, and delivered a long address in which he made many important recommendations. John H. Trumbull, who was elected lieutenant-governor in 1924, succeeded Senator Bingham as governor.

The legislature in February rejected the Child Labor Amendment.

**OFFICERS.** Governor, John Trumbull; Secretary of State, F. A. Pallotti; Treasurer, E. E. Rogers; Comptroller, F. M. Salmon; Attorney-General, F. E. Healey.

**JUDICIARY.** G. W. Wheeler, Chief Justice; John K. Beach, H. J. Curtis, W. M. Maltbie, John E. Keeler, F. D. Haines, G. F. Hinman, Associate Judges.

**CONSERVATION.** See Zoölogy.

**CONWELL, RUSSELL HERMAN.** American clergyman and educator, died at Philadelphia, December 6. He was born at Worthington, Mass., Feb. 15, 1843, and after receiving an elementary education at Wilbraham Academy entered the law department of Yale University in 1860, and in 1866 received the degree of LL.B. from Albany Law School. In the Civil War he took part for three years, being twice wounded and discharged a lieutenant-colonel. He was admitted to the bar in 1865, and practiced at Minneapolis, 1865-67. He also devoted himself to newspaper work and after serving as immigration agent for Minnesota to Germany he became foreign correspondent for the *New York Tribune* and the *Boston Traveler*, 1869-71. Returning to Boston in 1871 he practiced law for two years and then was ordained to the Baptist ministry at Lexington, Mass., taking over an old church whose congregation had dwindled to but a few persons. He was able to reestablish this church and secure funds for a new building. His success as a pastor led to his being called to Philadelphia where his eloquence as a preacher attracted large congregations to Grace Church, which erected a new building. He served here 1881-91, leaving to become pastor of the Baptist Temple. He was president of Temple University, Philadelphia, which he founded and which grew to have 7000 students. He founded Garretson Hospital and the Samaritan Hospital in Philadelphia, and in 1923 received the Edward Bok award of \$10,000 given to the man who had done the greatest service to Philadelphia during the previous year. He was one of the best known preachers and lecturers in the United States and it was said that through his one lecture "Acres of Diamonds" he had earned more than \$2,000,000, which he used for the education of boys. Through his lectures and writings he was said to have earned some \$11,000,000, but practically all of this was turned over to various benevolent enterprises. He was the author of many biographies and

many religious works including: *Woman and the Law* (1875); *Life of President Hayes* (1876); *Lives of the Presidents* (1878); *Life of Bayard Taylor* (1879); *Acres of Diamonds* (1888); *Life of President Garfield* (1890); *Life of Charles H. Spurgeon* (1893); *How to Live the Christ Life* (1912); *Observation* (1916); *What You Can Do With Your Will Power* (1917); *How a Soldier May Succeed After the War* (1918); *Effective Prayer* (1920); *The Angel's Lily* (1920); *The Romantic Rise of the Temple University* (1920); *Sermons for Occasions* (1921); *Unused Powers* (1922); *Why Lincoln Laughed* (1922); *Borrowed Ages* (1923); and *Life of John Wanamaker*.

**COÖPERATION, AGRICULTURE.** If not in the field of practical application, at least in the realm of discussion, the topic of coöperative marketing in 1925 was one of the outstanding economic matters before the American people. It was well known that President Coolidge and Secretary Hoover regarded it as an important item in a sound agricultural economy. One need refer only to President Coolidge's farm speech of December at Chicago in which he frankly told the farmers that their salvation lay not in government interference or subsidy but in coöperative activity. Surveys made by the Department of Agriculture reveal that the movement had taken firm root. During the year 1912-1915 it was reported that there were 5424 organizations actively functioning (with business transactions totaling \$310,000,000); by 1922, a later survey showed, the coöperatives had increased to 10,000. A new development was the appearance of large federalized or centralized organizations so great that 50 of them have a total membership larger than the whole membership of the 5400 societies operating in 1915. It was not until 1912 that the first regional association appeared, the Sun-Maid Raisin Growers of California. During the years 1912-20 only 10 of these regional societies were formed; but in the years following, development has been rapid. There are to-day some 61 of these centralized organizations in nine-commodity groups, as follows:

Commodity	Number of associations	Number of members
Tobacco .....	7	292,809
Cotton .....	15	267,916
Grain .....	15	76,139
Dairy products .....	1	65,000
Fruits and vegetables .....	7	40,370
Nuts .....	4	17,263
Wool .....	7	15,154
Poultry products .....	4	4,138
All others .....	1	5,500
<b>Total .....</b>	<b>61</b>	<b>784,289</b>

Fourteen of these associations are in the eastern States, and 14 in the western States. For 1925, it is estimated, the total business of these 10,000 coöperatives will reach \$2,500,000,000. This sum represents approximately one-fifth of the total agricultural business of the country.

**Loans.** It is interesting to note to what extent coöperative marketing associations have been aided by government agencies. It was reported that the Federal Intermediate Credit Banks had loaned to societies, upon warehouse receipts, the following sums (up to Sept. 19, 1925):

Tobacco .....	\$16,221,941
Wheat .....	1,878,374
Canned fruits and vegetables .....	2,069,490
Raisins .....	2,400,000
Olive oil .....	20,193
Peanuts .....	147,626
Wool .....	1,818,445
Hay .....	75,000
Cotton .....	3,298,604
<b>Total .....</b>	<b>\$27,925,175</b>

*Benefits of Coöperative Marketing.* Secretary Hoover went to the heart of the matter when, in a speech before the American Dairy Federation, he outlined the reasons for a necessary change in farm policy. The problem of improved marketing is centred in the elimination of waste. In the field of the perishables, i.e. dairy products, fruits, and vegetables, the major wastes are as follows: 1. The waste of an unnecessary number of purchases and sales

Pres. Coolidge's Agricultural Commission, appeared the following affecting coöperative marketing. The Commission suggested these measures to facilitate coöperative marketing of farm products: Federal recognition of pooling and control of distribution by organizations of producers; exchange of crop and market information; survey of distribution problems; Federal registration of producers and distributors approved by the Government; creation of standards, establishment of a Federal Coöperative marketing board. This was the crux of ex-Gov. Lowden's argument, repeated again and again during the year, as he sought to arouse the country to the perils attending its agricultural interest. See AGRICULTURE.

A statistical report of the Department of Agriculture indicates the enormous strides which agricultural coöperation has made in the past decade. The accompanying table summarizes the situation:

Kind of organization	1913		1922		1924		Estimated amount of business, 1923
	Number of associations	Amount of business	Number of associations	Amount of business	Number of associations	Membership, April, 1924	
Cotton .....	79	\$15,097,844	17	\$57,898,000	107	250,000	\$100,000,000
Dairy products .....	1,187	59,701,105	1,675	279,195,000	1,966	200,000	400,000,000
Fruits and vegetables .....	456	69,921,381	592	168,176,000	1,232	200,000	300,000,000
Grain .....	960	180,555,221	826	167,610,000	3,134	400,200	600,000,000
Livestock .....	44	4,823,539	413	63,424,000	1,598	250,000	250,000,000
Nuts .....	..	..	..	..	51	50,000	50,000,000
Poultry and products .....	..	..	..	..	56	15,000	50,000,000
Tobacco .....	18	2,555,420	8	60,849,000	25	290,000	150,000,000
Wool .....	..	..	..	..	115	50,000	20,000,000
Miscellaneous selling .....	..	..	..	..	729	70,000	160,000,000
Merchandise stores .....	111	5,928,117	320	23,507,000	717	150,000	50,000,000
Collective buying .....	..	..	..	..	430	100,000	70,000,000
All others .....	244	21,730,668	252	64,524,000	...	.....	.....
<b>Total .....</b>	<b>3,099</b>	<b>310,313,295</b>	<b>4,103</b>	<b>885,183,000</b>	<b>10,160</b>	<b>2,025,000</b>	<b>2,200,000,000</b>

transactions. 2. The waste of transportation of inferior and unsalable products. 3. The waste in decay arising from delayed movements and repeated handling. 4. The waste from inadequate facilities for expeditious handling. 5. The waste from uncontrolled distribution by which local gluts and famines are created. 6. The waste from the destruction of agricultural capital itself through inadequate return by crowding the market in periods of slight overproduction. 7. The waste in cost of speculation and hazards in distribution produced by all the above.

*Legislation.* On Nov. 7, 1924, the President appointed an Agricultural Conference headed by Robert D. Carey which sat from January 5 to 28 and submitted a report calling for the creation of a Federal coöperative marketing board. This, and two other reports, the President sent to Congress with a request for immediate legislation. A bill was introduced by Senator Capper in the Senate and Representative Williams in the House calling for the creation of such a coöperative marketing board. Other bills were introduced as well. The Haugen bill, introduced by the chairman of the House Committee on Agriculture received first consideration in the House. It was passed by the House on February 26 by a vote of 185 to 95. On March 2 the Senate Committee on Agriculture reported out the House bill but no action could be taken before adjournment.

Among the important recommendations of

LEGISLATION. The efforts of coöperative associations to have their activities protected by law were successful in 18 States, a survey at the beginning of the year showed. In the following States legislation has been enacted legalizing the formation of credit unions: Indiana (1923), Kentucky (1922), Louisiana (1924), Massachusetts (1921), Mississippi (1924), Nebraska (1922), New Hampshire (1921), New Jersey (1924), New York (1914), North Carolina (1919), Oregon, Rhode Island (1914), South Carolina (1915), Tennessee (1923), Texas (1913), Utah (1917), Virginia (1922), Wisconsin (1923). The fact that the laws were to a large extent similar in wording and function indicates that the work of the Credit Union National Extension Bureau had borne considerable fruit.

The general tenor of these laws, when analyzed, showed: That credit unions are given the usual corporate powers, including the rights to acquire property and to invest or borrow money; that the number of directors is fixed at five or more and the existence of a credit committee is required; that the funds of credit unions are to be derived from their share capital, fees, and deposits. In respect to this last, it is worthy of note that the value of a share is set at \$5 by three States, at \$10 by seven States, at \$25 by four States. In New York, no member may hold more than 5 per cent of the share capital nor more than \$5000 worth. In 11 States specific mention is made of the source

of deposits, viz., 5 (Indiana, Massachusetts, Mississippi, New Hampshire, New York) permit credit unions to receive deposits from members only, and 6 (Kentucky, North Carolina, South Carolina, Tennessee, Utah, and Virginia) allow also deposits from non-members.

Naturally, almost all the laws have specific declarations to the effect that loans are to be made to members only. And some of the laws declare that loans are to be made only for productive and provident purposes. For loans of more than \$50 security must be given in the majority of the States, this usually consisting of an endorsed note. Eleven States provide for a fixed interest charge as follows: in North Carolina and New Hampshire, the legal rate is to be charged; in Texas, the rate may not exceed 6 per cent; in South Carolina, 7 per cent; in Indiana, 8 per cent; in Utah, 12 per cent; in Louisiana, Mississippi, and New Jersey, not more than 1 per cent per month; in Virginia,  $1\frac{1}{4}$  per cent per month on the unpaid balance; in New York, 1 per cent per month with allowances for refunds in case of completed advance payments.

In view of the increasing attention which agricultural coöperative projects were receiving, the following summary will be of point: During the period 1920-24, 28 States have passed coöperative marketing acts, the distribution

associations are specifically declared not to be in restraint of trade. The names of the States are: Arizona (1921), Arkansas (1921), Colorado (1923), Florida (1923), Georgia (1921), Idaho (1921), Illinois (1921), Iowa (1921), Kansas (1921), Kentucky (1921), Louisiana (1922), Maine (1923), Minnesota (1923), Mississippi (1923), Missouri (1923), Montana (1921), New Jersey (1924), New York (1924), North Carolina (1921), North Dakota (1921), South Carolina (1921), South Dakota (1923), Tennessee (1923), Utah (1923), Virginia (1922), Washington (1921), West Virginia (1923), Wyoming (1923).

**BRITISH PRODUCTIVE SOCIETIES.** These productive coöperatives have had a long and virile history in Great Britain. Some of these societies have been in existence for more than 60 years. Note the distribution of 60 of them, according to the decade of establishment:

1860-69.....	4
1870-79.....	4
1880-89.....	12
1890-99.....	19
1900-09.....	10
1910-19.....	7
1920.....	4
Total.....	60

#### DEVELOPMENT OF COPARTNERSHIP PRODUCTIVE SOCIETIES IN GREAT BRITAIN, 1883-1924

Country and year	Number of societies	Capital	Amount of business	Profit	Loss	Dividend on wages
England and Wales:						
1883.....	12	£85,786	£188,248	£7,519	£114	...
1897.....	87	523,357	878,089	37,185	10,755	£5,812
1910.....	88	843,769	1,332,849	65,869	1,718	10,962
1924.....	57	1,243,599	2,680,042	158,057	7,644	33,748
Scotland:						
1883.....	3	17,650	22,503	1,512	...	...
1897.....	6	601,245	1,480,816	96,478	...	10,441
1910.....	5	1,346,636	3,137,039	149,823	186	16,042
1924.....	4	1,637,591	1,530,299	118,955	...	14,110

being 12 in 1921, 3 in 1922, 11 in 1923, and 2 in 1924. The following properties are generally common to most of the acts: That coöperative associations are given the right of purchasing

The preceding table gives details of operation for 1883, 1897, 1910, and 1924.

The following table gives details of operations for 1924:

Country and industry	Number of societies	Share and loan capital and reserve	Amount of business	Profit	Loss	Amount returned as dividend on wages
England and Wales:						
Textile.....	12	£568,427	£1,398,125	£94,910	£6,151	£18,799

their produce, purchasing farm supplies, and financing such activities; usually, the par value of shares of capital stock is not limited as in the case of the credit union laws though some of the States limit the amount of stock to be held by a single member; the activities of these

In the autumn, the *Monthly Labor Review* published statistics setting forth the progress of coöperation in various foreign countries. These figures indicate that in *Australia*, in 1923, there were 222 "producers' societies" with a membership of 167,989 and to 152 "consumers'

societies" with a membership of 107,703. The distinction between the two lies in the fact that the "producers' societies" pay dividends in capital invested, while the "consumers' societies" distribute dividends on the basis of purchases. Note these figures:

	Share capital £	Sales £	Net saving £
	1922		
Producer's .....	3,301,862	33,932,000	260,000
Consumer's .....	1,227,000	6,563,000	365,240
	1923		
	Share capital £	Sales £	Net saving £
Producer's .....	3,332,000	39,689,000	327,000
Consumer's .....	1,313,000	6,246,000	357,000
			Dividend on share capital or purchase £
			95,937
			229,000

In *Belgium*, a recent review indicated that concentration and amalgamation continued, especially in the Walloon districts. Coöperative activity has grown from 170,740 members and sales of 44,000,000 francs in 1910 to 250,000 members and sales of 300,000,000 francs in 1923-24. The extent of amalgamation may be judged from the following figures for the more important regional societies:

	No. of members	Sales for 1923-24 France
Union Coöperative de Liège ....	70,276	103,181,000
Union des Coöperateurs .....	12,778	14,692,000
Union des Coöperateurs, Borains	7,200	8,675,000
Magasins Généraux .....	8,888	11,680,000

For *Canada*, the 1924 *Statistical Yearbook* of Quebec printed the following statistics of the coöperative banks of Quebec for 1923. For the 113 banks reporting, there were 31,752 members, 29,771 depositors, 8373 borrowers, 12,273 loans granted for a total of \$3,429,000, \$354,804 in net savings, \$13,748 returned in dividends on a share capital of \$1,388,591.

In *Germany*, the coöperatives continued to flourish. The following figures are for the central society, its provincial affiliations, and the wholesale society. (The figures are from the *Central Union of German Consumers' Societies' Yearbook* for 1925).

Item	Society affiliated with Central Union		Wholesale society	
	1923	1924	1923	1924
Number of affiliated societies .....	763	1,023	1,049	821
Number of persons .....	3,450,000	3,506,000		
Number of persons employed .....	47,617	42,350	2,986	3,598
	Marks	Marks	Marks	Marks
Amount of reserves .....	359,000	12,818,000	3,988,000	4,033,180
Sales .....	318,363,000	555,553,000	71,321,000	168,466,000
Value of goods produced .....	50,222,000	116,698,000	11,336,000	26,298,000

The following was the character of the membership for 1924:

Independent tradespeople .....	119,952
Independent farmers .....	116,417
Professional and public employees .....	328,651
Wage earners in industry .....	2,207,274
Wage earners in agriculture .....	99,586
No fixed occupation .....	865,559
Total .....	3,317,439
Men .....	2,703,338
Women .....	614,101

**EDUCATION.** This review indicated that coöperative activity in the United States, except for the agricultural societies, was still in its infancy when one regards the progress of foreign societies. Education and publicity are therefore still deemed imperative. To further this end it is interesting to note the formation of the American Institute of Coöperation which made its initial appearance at the University of Pennsylvania in July-August. The Institute announced as its immediate purposes the following: To collect and make available a body of knowledge concerning the coöperative movement in America and other lands; to serve as a means of clarifying thought as to what the coöperative movement really is and of bringing about more harmony among organizations already existing; to serve as a means of training and developing leaders and workers in the coöperative movement; to serve as a means of assisting educational institutions throughout this country to improve their teaching courses in coöperation; to focus the spirit of the coöperative movement as a means of community and national development. Among the leaders taking part in the movement were Richard Pattee, managing director, New England Milk Producers; Frank Evans, secretary, American Farm Bureau Federation; F. G. Swoboda, general manager, Wisconsin Cheese Producers' Federation; Arthur R. Rule and W. B. Geissinger, representing the fruit growers; O. J. Sands and J. W. Alsop, representing the tobacco planters; C. O. Moser and V. B. Blalock, representing the cotton producers; and Governor Pinchot of Pennsylvania and ex-Governor Lowden of Illinois. See AGRICULTURE.

**COÖPERATIVE MARKETING.** See AGRICULTURE.

**COPPER.** The smelter production of copper from domestic ores in the United States during 1925, as estimated by the United States Bureau of Mines of the Department of Commerce, was the largest peace-time output on record, being approximately 4 per cent higher than that of 1924, which was the highest previously recorded with the exception of the war years, 1916, 1917 and 1918. The 1925 figure was 1,746,000,000 pounds of new copper produced by the refineries from domestic sources, as compared with 1,674,-

000,000 pounds in 1924. In 1925 the production of new refined copper from domestic and foreign sources amounted to about 2,237,000,000 pounds, as compared with 2,260,000,000 in 1924, a decrease of 23,000,000 pounds. However, there was an increase of secondary copper produced by primary refineries, which increased from 155,000,000 pounds to about 184,000,000 pounds in 1925, or 29,000,000 pounds, so that the total primary and secondary output of copper by American refineries was 6,000,000 pounds higher in 1925, being about 2,421,000,000 pounds

as compared with 2,415,000,000 pounds in 1924.

The Bureau of Mines also reported that the stocks of refined copper at the end of 1925 were less than half those reported at the end of 1924, decreasing from 243,000,000 pounds at United States' refineries at the end of 1924, to estimated stocks of about 112,000,000 pounds at the end of 1925. Stocks of refined copper on Nov. 30, 1925, were estimated at 119,000,000 pounds. Stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, were estimated to be about 398,600,000 pounds at the end of 1925, compared with 393,000,000 pounds on Dec. 31, 1924. The smelters and refineries estimated that about 417,000,000 pounds was on hand Nov. 30, 1925.

The quantity of refined copper withdrawn on domestic account during the year was about 1,485,000,000 pounds, compared with 1,355,000,000 pounds in 1924, an increase of 130,000,000 pounds. The method of calculation is shown below:

	1924	1925
Refinery production of new copper from domestic sources .....	1,674,000,000	1,746,000,000
Refinery production of new copper from foreign sources .....	586,000,000	491,000,000
Imports of refined copper (December estimated 1925) .....	146,000,000	120,000,000
Stocks of new refined copper January 1 ....	264,000,000	243,000,000
	2,670,000,000	2,600,000,000
Exports of refined copper (ingots, bars, rods or other forms) .....	1,072,000,000	1,003,000,000
Stocks December 31 ....	243,000,000	112,000,000
	1,815,000,000	1,115,000,000
Total withdrawn on domestic account .....	1,855,000,000	1,485,000,000

For metallurgical treatment of copper see METALLURGY.

**COPYRIGHT.** Registrations for the fiscal year 1924-25, according to the report of the U. S. Register of Copyrights, numbered 165,848 as compared with 162,694 for the preceding year. Of these 65,670 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 61,440, those printed abroad in a foreign language, 3266, while the remainder, 964, were English books registered for ad interim copyright. The chief classes of the remaining registrations, in order of numerical importance, were: Periodicals (40,880 numbers); musical compositions (25,548); prints and pictorial illustrations (10,827); photographs; dramatic or dramatico-musical compositions; works of art, including models or designs; maps; drawings or plastic works of a scientific or technical character; and motion picture photographs. The renewals numbered 3309 as compared with 3433 in the preceding year. The fees paid during the year amounted to \$166,909.55. The total number of articles deposited from July 1, 1897, to June 30, 1925, was 5,710,510.

The effort to amend the copyright law in order to permit the United States to enter the International Copyright Union of which mention was made in preceding YEAR BOOKS, continued to be unsuccessful; bills for this purpose were

again introduced in the 68th Congress, and were referred to the respective Committees on Patents. No action beyond committee hearings was taken by either House or Senate up to the close of the fiscal year. On Nov. 22nd, 1924, the President issued a proclamation in behalf of citizens of Switzerland and on Mar. 11, 1925, a proclamation in respect to Austria, under authority of section one (e) of the act of 1909, copyright controlling the mechanical reproduction of music.

The gross receipts of the Register's office for the fiscal year were \$173,971.95; the total expenditure for salaries, \$147,255.41; and for supplies, \$1,063.98. The year's business showed a substantial increase over that of 1924, which was the largest in the history of the office up to that time.

**CORN.** Production estimates received by the International Institute of Agriculture, Rome, indicated the world's corn (maize) yield in 1925 to be approximately 3,500,000,000 bushels as compared with 2,891,000,000 bushels in 1924. This yield, which did not include the Russian production, was pointed out to be over 21 per cent above the crop of 1924, and nearly 9 per cent above the average yield of the five years 1909 to 1913. The comparable data available gave the following yields for some of the leading corn-producing countries, exclusive of Russia and the United States: Roumania 175,433,000 bushels, Italy 106,252,000 bushels, Hungary 92,393,000 bushels and Bulgaria 23,137,000 bushels. Information regarding the 1925 production of British India, Brazil, Mexico, and other or less important corn-growing countries was not at hand. The corn area of Brazil for the 1925-26 crop was estimated at about 6,300,000 acres. The Argentine crop of 1924-25 amounted to 185,659,000 bushels, which was about 90,000,000 bushels below the crop of 1923-24. Provisional estimates placed this year's crop of the Soviet Republics in both Europe and Asia, at 186,190,000 bushels, an increase of more than 85 per cent over the preceding crop. A record-breaking production of 72,625,000 bushels as compared with the good crop of 29,464,000 bushels in 1923 was reported from the Ukraine.

Estimates issued by the Department of Agriculture showed that the United States produced 2,900,581,000 bushels on 101,631,000 acres as against 2,312,745,000 bushels on 101,076,000 acres in 1924. The average yield for the two years was 28.5 and 22.9 bushels per acre respectively. The average farm price on Dec. 1, 1925, was 67.4 cents per bushel while on Dec. 1, 1924, it was 98.2 cents. The low price of corn in 1925 caused dissatisfaction among the farmers of the corn belt and sustained the continued demand for congressional action with a view to the more economical handling and disposition of surplus production. All States reported corn production, the leading ones and their yields being as follows: Iowa 478,590,000 bushels, Illinois 388,080,000 bushels, Nebraska 236,600,000 bushels, Missouri 201,338,000 bushels, Indiana 201,318,000 bushels, Ohio 177,936,000 bushels, Minnesota 156,852,000 bushels, and Kansas 104,643,000 bushels. The average yield per acre varied from 7.5 bushels in Oklahoma to 52 bushels in New Jersey, and in the surplus-producing States from 15.8 bushels in Kansas to 48 bushels in Ohio. The average farm price by States on Dec. 1, 1925, ranged from about

55 to 65 cents per bushel in the corn belt States to \$1 and over in the New England, the south-western and most of the southern States. In 20 States this price ranged from \$1 to \$1.30 per bushel.

For the year ended June 30, 1925, the United States exported 9,791,000 bushels of corn, including 333,000 barrels of cornmeal in terms of grain. Argentina, during this period, exported over 160,000,000 bushels from the short crop of 1924-25 and the carry-over from the heavy yield of 1923-24. During the fall of 1925 new corn from South Africa was coming to the European market. In parts of Europe, however, the cost of feed barley was below the feeding price parity of corn, and this was considered as an important factor in the demand for corn in the continental countries. During the past year the United Kingdom, the Netherlands and Denmark were important purchasers. It was reported from Sweden, which is also an importing country, that the results of experiments indicate the possibility of growing successfully certain varieties of corn in the relatively mild climate of southern Sweden. A world's record in corn production was reported from Hardin County, Ohio, where a farmer produced 1600.1 bushels on 10 acres, or 160 bushels per acre, being 25.7 bushels per acre above the record established in 1922 in Licking County of that State with a yield of 1343.1 bushels on 10 acres. The highest average corn yield for the State, 48 bushels per acre, was recorded in 1925.

The European corn borer continued to spread during the year and now infests an area of about 40,000 square miles and has a wide distribution also in southern Ontario, Canada. The possibility of exterminating the pest was regarded as most doubtful. The production of sweet corn for canning and other purposes of manufacture in the United States was estimated at 993,000 tons on 403,150 acres, as compared with 589,000 tons on 332,230 acres in 1924, the average yields per acre being 2.5 and 1.8 tons respectively. The leading producing States were Illinois, Iowa, Maryland, Ohio and Indiana.

**CORN BORER.** See ENTOMOLOGY, ECONOMIC.  
**CORNELL UNIVERSITY.** A non-sectarian, coeducational institution of the higher learning at Ithaca, N. Y.; founded in 1865. There were 5393 students enrolled in the 1925 fall session, distributed as follows: graduate school, 556; college of arts and sciences, 1878; law, 187; medicine, 270; architecture, 166; engineering, 1118; veterinary medicine, 88; agriculture, 726; home economics, 464. Of these students 1270 were women. For the 1925 summer session the enrollment included 2023 students. The faculty composed of 1044 members had 282 professors, 170 assistant professors, 11 lecturers, 382 instructors, and 199 assistants. The productive funds of the institution stood, on June 30, 1925, at \$20,255,817. The income applicable to current expenses of the fiscal year was \$6,186,617. The lands and buildings were valued at \$8,917,457, and the equipment at \$3,592,776. The library contained 750,000 volumes. The New York State College of Home Economics was established at this university by act of the legislature in March, 1925. The new union building, Willard Straight Hall, presented to the University by the widow of Willard Straight, a Cornell alumnus, was formally dedicated on December 14th.

In his will Mr. Straight requested his widow to do something "to make Cornell more human" and she complied by presenting the building which cost over \$1,000,000 and was named in his honor. President, Livingston Farrand, LL.D.

**CORTIE, ALOYSIUS LAURENCE, S.J.** English astronomer and director of the Stonyhurst College Observatory, died May 17. Born at London, Apr. 22, 1859, he was educated at Stonyhurst College and St. Beuno's College, North Wales, entering the novitiate of the Jesuit Order in 1878. He was made priest in 1892, and studied astronomy at Stonyhurst Observatory under Father Perry, S.J., F.R.S. Permanently attached to this observatory in 1881 he was elected a fellow of the Royal Astronomical Society in 1891, serving for many years on its Council. From 1900 to 1910, he was director of the Solar Section of the British Astronomical Association and for many years president of the Manchester Astronomical Society. He participated in many expeditions to observe eclipses, including that to Vinaroz in Spain, 1905, and the British Government expeditions to the Tonga Islands, 1911, and to Hérnösand, and Sweden, 1914. He made many investigations in solar and stellar physics and in terrestrial magnetism. He taught physics and mathematics at Stonyhurst for 27 years and had been director of music at this institution for 19 years.

**COSMIC RAYS.** See PHYSICS.

**COSTA RICA, kō'sta rē'ká.** A Central American republic lying between Nicaragua and Panama and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

**AREA AND POPULATION.** The area is variously estimated at 18,691 to 33,000 square miles. On Dec. 31, 1923, the population was estimated at 498,435, of whom the greater part were in the provinces of San José and Alajuela. Indian natives numbered about 3500. The movement of population in 1923 was: Births, 19,026; deaths, 10,062; marriages, 2632. In that year the immigrants numbered 5032 and the emigrants 4543. The populations of the larger cities as estimated in 1923 were as follows: San José, 41,306 (with suburbs, 54,273); Alajuela, 13,505; Cartago, 19,049; Heredia, 13,608; and Limón, 11,786.

**EDUCATION.** Elementary education is free and compulsory, and the elementary schools are under local councils but subventioned by the central government. In 1923 they numbered 440 with 1354 teachers and 41,277 enrolled pupils. For secondary education there is a lyceum for boys at San José with 482 students in 1923, and a college for girls with 343 pupils; and there are colleges also at Cartago, Alajuela and Heredia, together with professional schools of medicine, law, pharmacy, and dentistry. In the President's message to congress on May 1, 1925, he gave the following facts on schools: "The education of the 38,672 children enrolled in 1924 cost the government for teachers' salaries 2,000,000 colones. In 1924 the government spent nearly 5,000,000 colones on education. Though almost 3,000,000 colones were spent on school buildings in 1924, 18 more schools must be opened before as many are open as in 1917. Nine new schools were opened in 1924, and 15 were in the course of construction."

**PRODUCTION.** Agriculture is the chief occupation, but there are large areas not yet cleared

that contain valuable cabinet woods. Coffee and bananas are the chief agricultural products. The next industry in importance is gold and silver mining, which is carried on on the Pacific slope. There are deposits of manganese ore near the Pacific.

**COMMERCE.** The foreign trade of Costa Rica for 1924 showed a substantial increase in both exports and imports. The total value of imports for 1924 was \$12,003,017, compared with \$9,785,841 in 1923; and exports in 1924 were valued at \$16,565,232 in comparison with \$12,833,190 in 1923. Imports were greater than in any year since 1920, on account of the general prosperity of the country brought about by the high prices abroad for all Costa Rican products, and on account of the large quantities of building materials imported after the March 1924 earthquakes. The value of exports as well was greater than in any year since 1919, principally due to the large coffee crop and the high prices received for it. The United States took 48 per cent of the Costa Rican exports, as compared with 54 per cent in 1923, and supplied 57 per cent of the imports as compared with 59 per cent in 1923. The relatively large decrease in exports to the United States in 1924 may be attributed to increased shipments of coffee to London. Previously, San Francisco had been obtaining about 34 per cent of the total crop, but of the 1924-25 crop that market only received about 12½ per cent. The chief exports in order of value were: coffee, bananas, precious metals, cacao, hard woods, hides, and sugar. The chief imports are: cotton goods, flour, iron and steel, paper and manufactures, cattle, and lard.

**FINANCE.** The budget for 1924 provided a revenue of £1,955,088 and an expenditure of £1,926,018. The chief sources of revenue have been: Customs, railways, liquors, drugs, taxes on land, and posts and telegraphs, and the chief classes of expenditures have been finance, education, and internal improvements. The customs receipts for the year ending Dec. 31, 1924, were 11,358,546 colones.

**COMMUNICATIONS.** In 1923, 567 ships of 951,722 tons entered the ports of Costa Rica and 564 ships of 944,605 tons cleared. In 1924 the total length of railway mileage was 403, of which 81 miles was government-owned.

**GOVERNMENT.** Executive power is vested in a president who is elected for four years and who carries on his administration through six secretaries of state appointed by him and responsible to him; legislative power in a chamber of representatives called the Constitutional Congress with 43 deputies elected for four years, one-half retiring every two years. President at the beginning of 1925, Don Ricardo Jimenez.

**HISTORY.** On the first of the year Costa Rica severed her membership in the League of Nations. Her notice was filed at Geneva on January 22 and was accompanied by her check for payment of back dues. It was believed that criticism of her failure to pay her dues was responsible for her action. Under the constitution of the League her withdrawal will not become effective until Jan. 1, 1927.

**COSTS OF PUBLIC EDUCATION.** See EDUCATION IN THE UNITED STATES.

**COTTON.** The Crop Reporting Board of the U. S. Department of Agriculture on Dec. 8, 1925, estimated the cotton crop of the United

States for 1925 at 15,603,000 bales, of 500 lbs. gross weight. Based on average monthly prices for the year, the farm value of the crop, including the seed, was estimated at \$2,000,000,000. This was the second largest cotton crop ever produced in the United States, the crop of 1914 exceeding the estimated crop of 1925 by 302,840 bales. Drought in western North Carolina and South Carolina, in Georgia, and in central and southern Texas probably greatly reduced the total yield, although this condition was detrimental to boll weevil activity. Favorable weather conditions in the fall and early winter made it possible to pick much cotton that would ordinarily have been lost, although much of this late crop will be of low grade. There was a largely increased area planted to this crop, and the acreage harvested was 11.1 per cent greater than in 1924. The Bureau of the Census reported that 14,826,452 running bales of the crop had been ginned to Dec. 13, 1925.

World's production data for 1925 at the end of the year were mostly preliminary estimates, but they indicated a larger crop than that of 1924, which was estimated at 24,700,000 bales. Estimates received by the Foreign Service of the Bureau of Agricultural Economics, U. S. Department of Agriculture, indicated a crop of 18,679,000 bales, exclusive of reports from India, China, Brazil, or Uganda. Increased production was indicated for each of these countries except Brazil. Of the estimated world's crop of 24,700,000 bales in 1924, the United States produced 13,627,936 bales; India, 4,846,400; Egypt, 1,471,000; Brazil, 598,500; Russia, 453,000; Mexico, 253,000; and Korea, 121,000 bales.

The accompanying table shows by States the cotton crop of 1924 as reported by the Bureau of the Census; the estimated crop for 1925, and the amount reported ginned to Dec. 13, 1925:

COTTON PRODUCTION IN THE UNITED STATES

States	Crop 1924	Estimated crop 1925	Reported ginned December 13, 1925
	500 lb. bales	500 lb. bales	Running bales
United States ....	13,627,936	15,603,000	14,826,452
Alabama .....	985,601	1,385,000	1,386,691
Arizona .....	107,606	94,000	79,954
Arkansas .....	1,097,985	1,530,000	1,347,969
California .....	77,823	126,000	81,430
Florida .....	18,961	40,000	39,852
Georgia .....	1,008,770	1,150,000	1,180,926
Louisiana .....	492,654	900,000	867,558
Mississippi ....	1,098,684	1,930,000	1,708,298
Missouri .....	189,115	260,000	226,247
New Mexico ...	55,243	61,000	57,598
North Carolina ..	825,524	1,090,000	1,085,584
Oklahoma .....	1,510,270	1,550,000	1,516,925
South Carolina ..	806,594	875,000	909,861
Tennessee .....	856,189	490,000	451,611
Texas .....	4,951,059	4,100,000	3,870,656
Virginia .....	88,746	50,000	48,345
All others .....	12,062	22,000	16,797

The table includes in the ginning report 306,557 round bales which are counted as half bales. About 75,000 bales of cotton produced in Lower California, but marketed quite largely through California, are not included.

In addition to the lint crop of 1924, the seed and its products added greatly to the total value. Oil mills crushed during the year ended July 31, 1925, 4,604,821 tons of seed, from which were obtained 897,555 bales of linters, 1,403,665,011 lbs. of oil, 2,125,135 tons of cake

and meal, and 1,330,891 tons of hulls, besides other products. Exports of cotton and linters during the cotton year, Aug. 1, 1924, to July 31, 1925, were 8,195,896 bales, 2,545,123 of which went to the United Kingdom; 1,852,735 to Germany; 903,608 to France; 734,922 to Italy; 1,040,168 to other European countries; and 862,057 bales to Japan. Imports during the same period were 292,288 bales as follows: From Egypt, 164,152 bales; Peru, 19,928; China, 45,118; Mexico, 27,062; British India, 34,419; and all other countries, 1609 bales.

The increase in cotton production in 1924 and 1925 was expected to aid materially in averting the threatened shortage of raw cotton, and from the manufacturers' point of view the situation should be improved. The U. S. Department of Commerce estimated the world's consumption of cotton in 1924 at 19,982,000 bales. This should leave a considerable carry over into 1925, estimated by *Textile Mercury* for November 7, 1925, at 4,267,000 bales, and with the present large output all demands should be supplied. In the United States in November, 1925, there were 32,892,324 active spindles, an increase of 1,131,728 over July, and the average number of spindle hours per spindle in place was increased from 192 to 207 hours. During the year ending July 31, 1925, the mill consumption of cotton in the United States was 6,191,349 bales, of which 4,218,611 were used in the cotton-growing States, 1,639,021 in the New England States, and 333,717 in all other States.

The efforts of European countries to extend cotton production in territories under their control were continued. The Empire Cotton Growing Corporation in its report for the year ended Mar. 31, 1925, showed expenditures of about \$200,000 to foster cotton growing in various parts of the British Empire, except India. The amount of cotton produced is reported at 350,274 bales, an increase of 40.8 per cent over 1923. The announcement was made that the British Cabinet had approved the recommendation for a guarantee of a loan of £10,000,000 for the development of transportation in East Africa touching the cotton regions of Uganda and Tanganyika (*Textile Mercury*, Nov. 7, 1925).

The Liverpool Cotton Exchange adopted a form of contract that was designed to encourage the growth and sale of Empire grown cotton. A cotton research experiment had been established under the auspices of the Empire Cotton-Growing Corporation in connection with the College of Tropical Agriculture in Trinidad, and investigations were to be begun at once in cotton breeding, physiology of the cotton plant, and cotton diseases and insect pests (*Nature*, Oct. 3, 1925). In India the income derived by the Central Cotton Committee under the Cotton Cess Act of 1923 for the year ended Mar. 31, 1925, amounted to about \$475,000, which under the law was devoted to research and aids in the production of cotton. A Research Institute for the improvement of crops, especially of cotton, was established at Indore, India, on Nov. 24, 1924, with Albert Howard as director. A Central Research had been established at Calcutta, Queensland, with branch stations for the production of improved cotton seed for planting. The growing of ratoon cotton in Queensland, which was prohibited in 1923, was resumed, although investigations of Summers showed the fibre from ratoon plants was inferior to the normal crop

(*Nature*, 115 [1925], p. 171). Under the auspices of the Commonwealth of Australia a survey has been made of Papua and the Mandated Territory of New Guinea to determine their possibilities for cotton production.

In Egypt an unusually large cotton crop was forecast, and fearing the effect of such large production on future prices the Government has promulgated a law forbidding the planting of more than one-third of the arable land to cotton in 1926. The Ministry of Agriculture established a number of seed farms to furnish planting supplies of seed of the leading commercial types of cotton (*Agr. Jour. India*, 20 [1925], p. 335). Complaint was made of the mixing of inferior cotton with the superior grades, and a system of control of cotton transportation and markets was adopted to prevent this practice. Investigations by Templeton indicated growing Sakel-arides cotton as a perennial gives a better second crop than when planted annually. The fibre was not inferior and, through its earlier maturity, the loss due to pink bollworm and shedding was less (*Egypt Min. Agr. Bul.* 55). Plowing land to a depth of 6 inches and winter irrigation had proved valuable practices for the control of the pink bollworm (*Bul. Imp. Inst.*, 23 [1925], p. 361).

The various countries of Africa in which special efforts were being made to foster cotton production report increased yields in 1925. In Belgian Congo a crop of 13,000 bales was produced in 1924, and Director-General of Agriculture, Edmund Lepae, claimed the crop could be increased to meet all the needs of Belgium did not mining development take so large a portion of available labor. Iraq, or Mesopotamia, produced 2500 bales in 1924, and gins were provided for the principal sections, but development was likely to be slow, owing to the sparse agricultural population (*Bul. Imp. Inst.*, 23 [1925], p. 362). According to the *Russian Review* for Dec. 1, 1925, cotton production in Asiatic Russia had again attained the maximum pre-war production, and the crop for 1925 was estimated at 150,000 metric tons, or about 57 per cent of the present quantity consumed by the Soviet textile industry. An attempt was being made to develop cotton growing in Paraguay. The exports for 1924 amounted to 2000 tons. A Cotton Institute had been established under the auspices of the Government, and an active effort has been begun to extend and improve the industry.

In the United States there was considerable extension of cotton culture, particularly in northern and western Texas and adjoining portions of Oklahoma and New Mexico. Considerable plantings were also made in Virginia, Tennessee, Kentucky, Illinois, and Missouri beyond the usual cotton zone. Considerable interest in cotton growing is reported in California, particularly in the San Joaquin Valley, and at the last session of the legislature an act was passed which provided for the establishment and protection of single variety districts. As a result in several counties cotton growing is restricted to the variety Acala.

**BOLL WEEVIL.** As mentioned above the season of 1925 was on the whole unfavorable to boll weevil attack. Important progress was reported in the use of poisons for the control of the boll weevil, and during the season more than 50,000 acres of cotton were treated with pol-

sons dusted from commercial airplanes. So great progress was made in the types of airplanes and suitable dusts for the use under varying conditions that this method of control seems entirely practicable. Studies which have been in progress by the U. S. Department of Agriculture have shown that the odorous substance in the cotton plant that attracts the boll weevil is trimethylamine. It was believed that this discovery would aid in attracting weevil to poisons and thus accomplish their destruction. Late in the year the reappearance of the pink bollworm in the region about Carlsbad, N. Mex., was reported, and a quarantine was reestablished prohibiting the movement of cotton lint and linters from this district without required disinfection.

**COTTON FORECASTS.** Much dissatisfaction was expressed relative to the cotton forecasts issued by the Bureau of Agricultural Economics, U. S. Department of Agriculture, beginning with that of Aug. 1, 1925, when the preliminary estimate was for a crop of 13,566,000 bales. Climatic conditions over important cotton regions had been so unfavorable that a small crop and high prices were generally expected. Later more favorable conditions were experienced, and they were continued into the late fall, resulting in a largely increased production. Under the law, semimonthly cotton reports are required. These showed substantial increases over the preliminary estimate until that of October 18 was 15,266,000 bales, which was increased to 15,603,000 bales in the final estimate of December 8, 1925. According to the *Economic World* of Oct. 31, 1925, the wide variations shown by successive estimates had a disturbing influence on the situation. The act providing for semimonthly reports from September to December was approved May 3, 1924, and it had been in effect but little over a year, but several bills were introduced in Congress to repeal or modify the law.

**GRADE STANDARD.** As a result of conferences, ending with one in London, May 20, 1925, all points of contention regarding standards for grades and colors of American upland cotton were adjusted, and these standards became universally recognized.

The Twelfth International Cotton Congress was held in Vienna, Austria, June 4-6, 1925.

OGY, ECONOMIC.

**COTTONSEED.** See COTTON.

**COUNCIL-MANAGER.** See MUNICIPAL GOV-  
ERNMENT.

**COUNTY CONSOLIDATION.** See MUNICI-  
PAL GOVERNMENT.

**COURT TENNIS.** See RACQUETS.

**COWS.** See DAIRYING; LIVESTOCK.

**CREDIT UNIONS.** See COÖPERATION.

**CRETE.** An island in the Mediterranean Sea, ceded to Greece after Aug. 10, 1913. Area, 3327 square miles; population according to the census of 1920, 346,584. Capital, Candia, with a population of 24,976 in 1920.

**CRICKET.** Several international competitions featured the cricket season of 1925. Haverford College of Pennsylvania sent a team to England which played 14 matches, of which only one was won by the visitors. In the Halifax Cup series the Philadelphia Cricket Club carried off the laurels, C. B. Dixon excelling in the batting department and G. W. Cunit, jr.,

in bowling. /Bermuda was the scene of still another international clash, the New York Veteran Cricketers' Association playing five games there, but winning only one. The Manor Field Cricket Club captured the championship of the New York and New Jersey Cricket Association while the Brooklyn Cricket Club was the winner of the Metropolitan League title. Yorkshire won the English County championship for the fourth consecutive time, thereby establishing a record. J. B. Hobbs, the well-known English bantam, set a new world's record by bringing his total number of centuries (100 runs or more in an inning) scored during his career as a professional up to 129. Hobbs also tallied 16 centuries during the 1925 season, constituting another record.

**CRIME.** It may be said that one of the outstanding public questions of the year was the resurgence of crime throughout the whole country. It must be recorded that the discussion aroused by this discovery proved somewhat fruitless; that while sociologists, public officials, and bankers exercised themselves profoundly over the question, crime did not appear to abate. There was, first and above all, disagreement as to causes. To R. W. Child, who studied the problem during the year, the outstanding cause for the remarkable multiplication of crimes throughout the country was the matter of punishment. Too many crimes went altogether unpunished and too many were punished too lightly. Jurists, too, cited the indeterminate sentence and the wide powers of parole boards as contributing causes. To others the reason lay in the carelessness and freedom of the American community. Commissioner of Police Enright, in New York, and others, suggested registration and greater surveillance of population, particularly its suspicious members. Other causes advanced were: The easy sale of firearms, the sale and use of drugs, the numerous character of the laws on the statute books, the failure of education in the case of the young who are becoming criminals. The lack of parental control, particularly in the case of native-born children with foreign-born parents, the disregard for human life that many war veterans brought back with them, the inequality of wealth distribution more particularly in evidence as a result of the vulgar displays of the *nouveau riche*, and the lack of morality in conduct of business were other, and perhaps deeper, reasons that were adduced in explanation of the rising tide of crime threatening to engulf many of the large cities of the country.

The situation led to the formation of the National Crime Commission in August. At the first meeting, held in New York, we find attending Governor Smith, Elbert H. Gary, R. W. Child, Franklin D. Roosevelt, and President Knox of the American Bankers' Association. F. Trubee Davison, Chairman of the Commission, declared that the chief purposes would be the assembling of crime statistics, the preparation of a preventive programme, the repair of defects in the administration of justice, etc. The executive committee appointed was made up of Dr. E. A. Alderman, Newton D. Baker, R. W. Child, Mrs. Ethel Roosevelt Derby, Hugh Frayne, Herbert S. Hadley, Charles E. Hughes, Frank O. Lowden, Franklin D. Roosevelt, and Chester H. Rowell. A general meeting was held in New York in November in which the executive com-

mittee was organized and a statement issued in which it was said for the Commission that it would "assist in the creation of local crime commissions. As a central body it not only hopes to keep alive a national vigilance and to unify opinion but will attempt to obtain standardization of criminal statistics, current information, better methods of criminal identification, and the general improvement of police, criminal procedure, and penal results." Before the year ended a special committee for the improvement of legal procedure, prosecution, and judicial administration was named. Former Governor Hadley of Missouri was designated chairman, and others named included Charles S. Whitman, Roscoe Pound, John H. Wigmore, and Judson Harmon.

**STATISTICS.** It is notorious that the country has no reliable body of criminal statistics covering indictments, crimes, convictions, and sentences. We must be content with guesses. Dr. Hoffman, statistician for the Prudential Insurance Company and an outstanding authority, puts the annual number of homicides at 11,000. In 1922, he points out, there was one homicide in England and Wales for 16 in the United States; in 1923 the Australians killed one man for every five killed here. His figures are illuminating:

In 1922 the homicidal death rate of the United States Registration Area was 8.4 per 100,000 of population, while in the registration States the rate between 1910 and 1920 increased from 5.9 to 7.9. By way of contrast it may be pointed out that the homicide rate of England and Wales, compiled in practically the same manner, was only 0.5 per 100,000 for 1922 and 0.6 for 1923. In other words, to every one death from homicide in England and Wales there occurred proportionately about 16 in this country!

In Scotland in 1923, among a population of not quite 5,000,000, there occurred only 11 deaths from homicide, or at the rate of 0.2 per 100,000 of population. The population of Massachusetts for 1923 was not quite 4,000,000 and the deaths from homicide 107, or at the rate of 2.5 per 100,000. In other words, there were about 12 times as many deaths from homicide in Massachusetts as in Scotland.

In the Province of Ontario in 1923, among a population of a little over 3,000,000, the number of deaths from homicide was 49, representing a rate of 1.6, which compares with a rate of 2.5 for Massachusetts and 8.4 for the United States Registration Area for 1922.

**CRIME AND ABNORMALITY.** The belief has always persisted that crime, to a large extent, is a pathological condition and can be definitely linked up with feeble-mindedness or other mental abnormality. Thus, the National Committee for Mental Hygiene, having examined 10,000 criminal delinquents, reports that fully half are mental cases. The fruits of these labors will be the establishment of psychiatric clinics at Sing Sing and in Massachusetts. Because so many of the criminals incarcerated in jails are repeaters,—in New York County jails 66 per cent were repeaters and 30 per cent had been arrested four or more times—the Committee was led to question the current notions in penology. Says their report:

It [society] has in recent years thought somewhat more of reformation and a little less of retribution, and in its attack upon the problem has made extensive use of the instrument of probation. But the weakness of probation has been in the absence of competent direction and advice in the examination and treatment of offenders and the oversight of the vitally important mental and emotional factors that cannot be ignored in any attempt to prescribe adequate rehabilitative measures.

**COST OF CRIME.** A writer in the *Police Magazine* declared that criminal depredations cost the country, in 1924, the staggering sum of three billions of dollars. He quotes as his authority the statements of the American Bankers' Association, one of whose reports went on to say: "Criminal depredations against banks reaches the peak during 1924. The constant increase in criminality since 1919 has passed the day of reckoning, and unless bankers themselves apply more drastic preventive measures there is no assurance of this rising tide of crime subsiding." It was pointed out that hold-ups, in particular, were on the increase, their number growing from 97 in 1921 to 165 in 1924. The Bankers' Association agrees with Commissioner Enright of New York in insisting upon greater police surveillance. Says another of the Bankers' Association reports: "Last year (1924) 90 per cent of the daylight robberies of banks occurred in the suburbs or rural districts where police protection is largely in the hands of sheriffs and constables. . . . Their work is severely localized and seldom permits of the time or facilities to match the speed of present-day highwaymen and their high-powered automobiles."

The report argued for creation of State constabularies and points to the fact that in Connecticut, Maryland, Massachusetts, New Jersey, New York, Pennsylvania, and West Virginia, where such constabularies exist, a total of 46 bank robberies was committed during 1921, 1922, 1923; whereas in Indiana, without such a State police force, the number of such depredations exceeded the total for the above seven States combined.

**CHICAGO.** Chicago vied with New York in maintaining the attention of Americans agast at the increasing toll that crime was taking in the country; in fact, by many it was considered the leading crime centre. Figures showed that in 1924 there were 350 murders in Chicago as against 347 in New York. The toll of lives taken by "moonshine" liquor alone was 240. The police officers were said to consider the "black belt" of the city, with its population of 250,000 negroes, as the centre of crime, for here it was that 150 of the total 350 murders were committed. A Crime Commission, created to investigate causes and remedies, reported, in part:

Chicago's murder rate for six years is as follows:

1919.....	330
1920.....	194
1921.....	190
1922.....	228
1923.....	270
1924.....	350

For the purpose of this discussion, the Crime Commission has selected a period beginning Jan. 1, 1921, and ending Nov. 1, 1924. In that time, the number of murders reported has been 991; the number of individuals indicted has been 485 (60 per cent of the murders reported). The number of trials has been 480, or a little more than 50 per cent of the murders reported. The number of penalties or sentences imposed has been 250, or 25.36 per cent of the murders reported.

**PRISONERS.** A census of the prisoners in State and Federal institutions in 1923, made public late in the year, threw some startling light on the crime situation. This showed, first, that there was a decline in commitments of

one-third for each 100,000 population in 1923 as compared with 1910; that commitments for robberies, however, increased 83 per cent in the 13 years as compared with a decrease in the less bold burglaries; that forgery increased 68 per cent; rape, 33 per cent; and homicide, 16 per cent. Drunkenness and disorderly conduct

sons arrested only part are indicted and convicted; there is also not included those convicted offenders who receive suspended sentences or those who are released on the payment of fines.

The tables that follow give parts of this survey:

TABLE A

Offense	Commitments during the year: 1923 and 1910							Per cent (+) or decrease (-)
	Number		Per cent distribution		Ratio per 100,000 population <sup>a</sup>			
	1923 <sup>b</sup>	1910	1923	1910	1923	1910		
Drunkenness . . . . .	91,867	170,941	25.6	35.6	83.1	185.9	- 55.3	
Disorderly conduct . . . . .	53,359	91,847	14.9	19.1	48.5	99.9	- 51.5	
Violating liquor laws . . . . .	39,340	7,713	11.0	1.6	35.8	8.4	+ 326.2	
Vagrancy . . . . .	28,030	49,670	7.8	10.4	25.5	54.0	- 52.8	
Larceny . . . . .	27,141	39,338	7.6	8.2	24.7	42.8	- 42.3	
Assault . . . . .	12,606	22,509	3.5	4.7	11.5	24.5	- 53.1	
Violating traffic laws . . . . .	11,493	( <sup>c</sup> )	3.2	( <sup>c</sup> )	10.5	( <sup>c</sup> )	( <sup>c</sup> )	
Violating city ordinances . . . . .	10,116	5,098	2.8	1.1	9.2	5.5	+ 67.3	
Burglary . . . . .	8,574	8,105	2.4	1.7	7.8	8.8	- 11.4	
Violating drug laws . . . . .	7,103	314	2.0	0.1	6.5	0.3	+ 2,066.7	
Carrying concealed weapons . . . . .	5,642	6,460	1.6	1.3	5.1	7.0	- 27.1	
Fornication and prostitution . . . . .	5,114	6,029	1.4	1.3	4.7	6.6	- 28.8	
Fraud . . . . .	4,766	8,924	1.3	1.9	4.3	9.7	- 55.7	
Forgery . . . . .	4,093	2,063	1.1	0.4	3.7	2.2	+ 68.2	
Gambling . . . . .	4,035	6,893	1.1	1.4	3.7	7.5	- 50.7	
Homicide . . . . .	3,906	2,876	1.1	0.6	3.6	3.1	+ 16.1	
Malicious mischief and trespassing . . . . .	3,703	9,997	1.0	2.1	3.4	10.9	- 68.8	
Nonsupport and neglect of family . . . . .	3,660	2,793	1.0	0.6	3.3	3.0	+ 10.0	
Robbery . . . . .	3,584	1,657	1.0	0.3	3.3	1.8	+ 83.3	
Rape . . . . .	2,149	1,406	0.6	0.3	2.0	1.5	+ 33.3	
All other classified offenses . . . . .	17,193	24,399	4.8	5.1	15.6	26.5	- 41.1	
Unclassified or unknown . . . . .	10,519	10,755	2.9	2.2	9.6	11.7	- 17.9	
Total . . . . .	357,493	479,787	100.0	100.0	325.1	521.7	- 37.7	

<sup>a</sup> Based upon estimated population Jan. 1, 1923, and enumerated population Jan. 1, 1910.

<sup>b</sup> Estimated for the last six months of the year. (See p. 1.)

<sup>c</sup> Not separately shown in 1910, but included under "Violating city ordinances."

TABLE B

Age	Present Jan. 1		Prisoners: 1923		Commitments Jan. 1-June 30		Female
	Number	Per cent distribution	Total number	Per cent distribution	Male		
Under 18 years	2,230	2.0	3,390	2.0	2,917	473	
18 to 20 years	11,739	10.8	14,567	8.8	12,715	1,852	
21 to 24 years	21,489	19.7	24,666	14.8	22,087	2,579	
25 to 34 years	37,336	34.2	46,605	28.0	42,587	4,018	
35 to 44 years	20,537	18.8	37,510	22.5	35,150	2,360	
45 to 54 years	9,493	8.7	20,522	12.3	19,600	922	
55 to 64 years	3,690	3.4	7,658	4.6	7,413	240	
65 years and over	1,284	1.2	2,285	1.4	2,206	79	
Age unknown	1,277	1.2	9,153	5.5	8,386	817	
All ages	109,075	100.0	166,356	100.0	153,016	13,340	

declined 50 per cent since 1910; fraud declined 55 per cent; assault and vagrancy, 50 per cent each; larceny, 42 per cent; and carrying concealed weapons, 27 per cent. The ages of criminals are interesting. The number of commitments of persons between the ages of 21 and 24 is the largest; commitments of persons between 15 and 17 years decreased twice as fast as did the former group. A study of prisoners by States reveals the fact that commitments increased only in Louisiana, Kansas, and Ohio, while the greatest decreases were in New England. Arizona, however, came first with a decrease of 89 per cent; Oregon, New Mexico, and Montana, Florida, and Missouri showed decreases of over 50 per cent; New York showed a decrease of 16 per cent.

It should be noted that these statistics reveal only the number of sentenced prisoners; they are not by any means an index to the number of crimes committed. A large proportion of lawbreakers are never apprehended; of the per-

## CROATIA (krō-a'shī-ā) AND SLAVONIA.

Formerly a crownland of Austria, extending from the Adriatic Sea to the Danube River; since 1918 a province of the new state of Jugo-Slavia (q.v.). Area, Dec. 31, 1920, 16,920 square miles; population, 2,739,593. Capital, Zagreb or Agram, with a population in 1919 of 108,338.

**CROMWELL, SEYMOUR LEGRAND.** A former president of the New York Stock Exchange died September 16, at Morristown, N. J., as the result of injuries received on September 6. He was born in Brooklyn in 1871 and graduated at Harvard University, in 1892. After working in various business capacities he became a partner in the Stock Exchange firm of Strong, Sturgis & Company in 1896. In May, 1914, he was elected a member of the Board of Governors of the New York Stock Exchange, and in May, 1921, became its President, serving until May, 1924. Mr. Cromwell while in this office faced the problems connected with a period of deflation

and was active in efforts to suppress the bucket shops by which investors throughout the United States were being swindled out of millions of dollars. He was instrumental in the formation of the Better Business Bureau of New York to educate the public regarding investment. He did much to secure popular support for the work of the New York Stock Exchange. He was active in raising the standard of practices among the members of the Exchange, and in developing its discipline and ethics. After retiring from the presidency of the Exchange he continued in business. Making his home at Bernardsville, N. J., he was active in civic and charitable interests, serving for 10 years as president of the State Charities Aid in New Jersey and as a member of the commission appointed by Governor Edge to prepare plans of management for the State penal institutions. He was president of the New Jersey State Home for Boys at Jamesburg and president of the Fatherless Children of France for which latter service he was made an officer of the Legion of Honor by the French Government. He was also an enthusiastic sportsman, being president of the Essex Fox Hounds of Peapack, N. J., and interested in various country clubs in the vicinity of his home.

**CROPS.** See AGRICULTURE.

**CROSBY, WILLIAM OTIS.** American geologist, died at Boston, Mass., December 31. He was born at Decatur, O., Jan. 14, 1850, and after graduating at the Massachusetts Institute of Technology with the degree of B.S. in 1876, practiced mining engineering in North Carolina and Colorado. In 1883 he became professor of geology in the Massachusetts Institute of Technology, holding this chair until 1907 when he retired and became consulting geologist. In addition to his research work he served as special geologist to the United States and New York geological surveys, United States Reclamation Service, United States Army Engineers, Metropolitan Water Board of Boston, and the Board of Water Supply, of New York. He was also engaged in geological investigations in connection with the engineering projects in the United States, Canada, Mexico, Alaska, and Spain. He was consulted in many important undertakings, notably in connection with the Hudson River syphon; with the Catskill Aqueduct; with the Wachusett dam and reservoir connected with the water supply of the City of New York; the Nashua, N. H., tunnel, aqueduct and distribution system; the Boston subways and tunnels; the large South Boston dry dock; and new buildings of the Massachusetts Institute of Technology in Cambridge. He was a member of many geological and mining societies, and the author of: *Common Minerals and Rocks* (1881); *Guide to Mineralogy* (1886); *Tables for the Determination of Common Minerals* (1887); *Guide to Dynamical Geology and Petrography* (1892); as well as such works as: *Contributions to the Geology of Eastern Massachusetts* (1880); *Geology of the Boston Basin* (1893-94); *Geology of Long Island*; and many papers in geological and other scientific press.

**CROSS COUNTRY RUNNING.** The national senior Amateur Athletic Union cross country run of 6¼ miles, held at New York City, was won by Willie Ritola, Finnish-American A. C., with Fred Wachsmuth, Millrose A. A., and winner in 1924, second, and James Henigan,

Dorchester Club, third. The team trophy for the second year in succession was captured by the Finnish-American A. C. The Dorchester Club finished second and the Meadowbrook Club third. Willie Ritola added to his long distance laurels by winning the annual ten-mile A. A. U. run. Fred Wachsmuth was second and James Henigan third. The intercollegiate cross country championship was won by Syracuse University, Williard L. Tibbetts of Harvard University being the individual leader. Tibbetts's time for the 6 miles was 30 minutes, 34 seconds. The team scores of the first five colleges follow: Syracuse, 47; Pittsburgh, 84; Harvard, 122; Maine, 144; Penn State, 146. The national A. A. U. Marathon championship, held under the auspices of the Boston A. A., was won by Charles L. Mellor of the Illinois A. C., his time being 2 hours, 33½ seconds. Clarence DeMar, Melrose Highlands, Mass., winner of this event in 1922, 1923, and 1924, finished second and Frank Zuna of Newark, N. J., third.

**CRUISER.** See VESSELS, NAVAL; NAVAL PROGRESS.

**CUBA.** A Latin-American republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana.

**AREA AND POPULATION.** Area, 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. The population of the republic increased from 3,143,210 at the close of 1923 to 3,368,923 at the close of 1924 according to statistics published by the National Census Bureau. The total is comprised of a white population of 2,294,115, a colored population of 830,791, and unclassified amounting to 244,017. The percentage of whites is 68.10, of colored, 24.66, and unclassified, 7.24. The chief towns with their populations in 1922 are: Havana, 432,353; Cienfuegos, 72,919; Camagüey, 92,073; Manzanillo, 60,544; Santiago de Cuba, 73,800; Guantánamo, 52,598; Santa Clara, 69,200; and Sancti Spiritus, 86,418. Of the six provinces, viz., Havana, Oriente, Santa Clara, Pinar del Rio, Matanzas, and Camagüey, the largest and most populous is Oriente and the next in respect to population is Havana. There is a large transitory immigration yearly consisting largely of Spanish laborers who return to Spain after the harvest season.

**EDUCATION.** Education is free and compulsory between the ages of six and 18. The public school system was developed under American supervision after the passage of the Education Act of 1899. In 1923-24 the enrollment was 272,892 pupils (201,940 white), in 3316 government schools with 5970 teachers. In 1923 private schools numbered 438, with 1475 teachers and 28,480 pupils. There is a special institute for advanced education in each province, and annexed to them are normal schools for the training of teachers. University instruction is provided by the University of Havana which was founded in 1721.

**PRODUCTION.** The staple products are sugar and tobacco, but cacao, cereals, coffee, potatoes, and fruits are also raised. Cuba is the largest producer of sugar (q.v.) in the world, contributing over one-fifth of the world's sugar crop, or nearly 4,000,000 tons per year, an enormous production for a country having only 3,000,000 inhabitants. The agricultural activities of the

people are consequently largely concentrated on this crop. To a large extent Cuba's imports are dependent upon the price of her sugar crop, about 80 per cent of which is shipped to the United States. In 1923-24 the crop was 4,076,000 tons and the forecast of the crop for the following year was 4,965,585 tons.

COMMERCE. According to the United States Bureau of Foreign and Domestic Commerce the external commerce of Cuba reached a total volume of \$724,594,585 in 1924, consisting of exports of \$434,060,000 and imports of \$290,525,585. This figure is in excess of the volume of trade in the previous year by \$34,568,864, although the distribution of the trade was not quite so favorable as in 1923. The value of the imports increased by \$21,574,479 while the value of the exports increased by only \$12,994,357. The balance of trade in favor of Cuba in 1924 amounted to \$143,543,415, a decrease of over \$9,000,000 when compared with the balance of \$152,123,537 in the previous year. The value of exports to the United States declined from \$367,345,910 in 1923 to \$361,468,413 in 1924. This decline is more than accounted for by the value of sugar shipments; the quantity decreased only slightly. The share of the United States in the total export trade of Cuba showed a falling off from the previous year, the percentages being 87.2, and 83.2, respectively. This decline was occasioned by the greater volume of sugar moving to European countries, particularly to the United Kingdom. The share of the leading countries in Cuba's import trade showed little variation from the preceding year. The share of the United States declined slightly, from 67.7 per cent in 1923 to 66.2 per cent in 1924, although registering an actual gain in value of \$10,324,756.

The accompanying table shows the exports and imports of Cuba, by countries, for 1923 and 1924:

FOREIGN TRADE OF CUBA, 1923-1924

<i>Countries of destination and of origin</i>	<i>Imports</i>	<i>Exports</i>
	1923	1924
United States .....	\$181,717,272	\$192,041,848
Spain .....	13,213,009	14,533,621
France .....	3,889,827	5,510,266
United Kingdom .....	12,970,503	12,267,724
Germany .....	7,957,582	9,804,527
Other countries in America .....	23,246,496	26,638,206
Other countries in Europe .....	8,859,431	12,817,093
All other .....	13,116,986	12,912,300
Total .....	268,951,106	290,525,585
<i>Exports</i>		
United States .....	367,345,910	361,468,413
Spain .....	1,578,567	1,350,419
France .....	2,584,106	4,248,900
United Kingdom .....	32,407,541	49,261,954
Germany .....	629,639	1,408,384
Other countries in America .....	11,071,888	8,767,338
Other countries in Europe .....	4,646,489	5,543,563
All other .....	810,503	2,020,029
Total .....	421,074,643	434,069,000

FINANCE. For the fiscal year 1924-25 the Cuban government operated without a special budget, the 1923-24 budget having automatically been applied, owing to the failure of Congress in June, 1924, to agree upon a measure. For provisions of the last budget see preceding YEAR BOOK. For the fiscal year ending June 30, 1926, a budget was adopted calling for revenues of \$84,791,650 and for expenditures of

\$83,016,297. Of the latter sum \$18,236,046 pertains to fixed charges, involving interest and amortization of the public debt and expenses of the Congress and judiciary. The sum of \$64,780,250 was appropriated for the various departments of the executive power and for the special fund for war veterans. While the new budget shows an increase over those of recent years—the budget for 1923-24 called for revenues of \$68,500,000 and expenditures of \$61,672,169—it was pointed out that the increases arose mainly from provisions for paying outstanding obligations, such as installment on the floating debt claims and long-due bonuses to government employees for past years, rather than from increases in the expenses of operating the government.

COMMUNICATIONS. In 1923 there were 3240 miles of steam railways, all of which were owned and operated by private corporations. There were also 250 miles of electric railways, similarly owned.

GOVERNMENT. Executive power is vested in a president and cabinet, and legislative in a congress of two houses, viz., a senate with 24 members and a house of representatives with 114 members. President at the beginning of 1925, Dr. Alfredo Zayas. He was succeeded on May 20, 1925, by Gen. Gerardo Machado, who announced his cabinet as follows: Secretary of State, Carlos Manuel de Céspedes; Justice, Jesús Barrasque; Interior, Rogerio Zayas Bazán; Treasury, Enrique H. Cartaya; Public Works, Carlos M. de Céspedes; Education, Guillermo F. Mascaro; War and Navy, Rafael Iturralde; Agriculture, Commerce, and Labor, Andres Pereira; and Public Health and Charities, Daniel Gispert.

## HISTORY

THE ISLE OF PINES TREATY. On March 13 the United States Senate by a vote of 63 to 14 ratified the Hay-Quesada treaty, by the terms of which the United States gave up all claims to the island which she might have had as a result of the Spanish-American War. This treaty had been pending before the American Senate for more than 20 years. This act was received throughout Cuba and Latin America in general as a token of friendship on the part of the United States for her southern neighbors. In some quarters of Cuba resentment was felt against the general rejoicing because it seemed to be a sign of servility.

PRESIDENT GERARDO MACHADO. As noted in the preceding YEAR BOOK, General Gerardo Machado y Morales was successful in the elections for president held on Nov. 1, 1924. In April, 1925, he visited the United States and was officially entertained as a guest of the nation. In his speeches he spoke cordially of the relations between his country and the United States and said that he would do everything in his power to further them. He furthermore stated that his internal policies contemplated vast material improvements in the form of road building and the gradual amortization of the public debt. He was inaugurated on May 20 and on the same day announced the following cabinet: Secretary of State, Carlos Manuel de Céspedes (Liberal); Justice, Dr. Jesús Maria Barrasque (Liberal); War and Marine, Rafael Iturralde (Popular); Interior, Rogerio Zayas Bazan (Liberal); Education, Guillermo Fernandez

Mascaro (Popular); Sanitation, Daniel Gispert (Popular); Finance, Enrique Hernandez Carataya (Liberal); Agriculture, Commerce, and Labor, Andres Pereira (Popular); Public Works, Carlos Miguel de Céspedes (Liberal); Secretary of the Presidency, Virato Gutierrez (Liberal).

**CUBAN EXPOSITION.** Supported by the Cuban government and the Cuban Chamber of Commerce, the first Cuban Exposition in the United States was opened in New York City on November 16. The exposition was held primarily for the purpose of acquainting Americans with the economic and social life of Cuban citizens. A speech by President Machado in Havana was broadcasted and reproduced by amplifiers at the exposition.

**CULME-SEYMOUR, VICE-ADMIRAL SIR MICHAEL, K.C.B.** British Naval Officer and Second Sea Lord of the Admiralty, died April 2 in London. He was born Aug. 29, 1867, the son of Admiral Sir Michael Culme-Seymour and one of the family for generations distinguished in the British Navy. He entered the British Navy in January, 1881, becoming Lieutenant in 1889, Captain in 1905, and Rear-Admiral in 1916. In 1908 he was appointed Assistant Director of Naval Intelligence, a title changed to Assistant Director of Naval Mobilization in the following year when the Mobilization Department was formed. After service at sea he became a battleship commander. At the Battle of Jutland in May, 1916, he was a sub-divisional leader in the first division, led by Vice-Admiral Jerram, his ship being third in the battle fleet line. For his services in the battle he was awarded the C.B. and in June, 1916, he was promoted to Rear-Admiral, three months later becoming Director of the Mobilization Division of the Admiralty War Staff. On Sept. 1, 1918, he hoisted his flag on the *Lord Nelson* for service in the Mediterranean, and after the armistice with Turkey he was in command of the Black Sea and Caspian Squadron. Later, on the *Emperor of India*, he held the title of Second-in-Command, Mediterranean Station. In 1920 he was created K.C.B. and promoted to Vice-Admiral in October, 1920. In January, 1923, he became Commander-in-Chief of the North America and West Indies Station, serving until March, 1924, when he was recalled to become Second Sea Lord of the Admiralty. He was considered one of the most experienced officers in the British Navy in regard to training and mobilization.

**CUMBERLAND PRESBYTERIAN CHURCH.** This is one of the branches of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810 when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and theological standard, also because the revival party objected to the doctrine of fatality as taught in the third and tenth chapters of the Westminster confession of faith. In 1829 it comprised four synods and a general assembly, with its chief strength in the Southern States; in consequence of which latter fact, it was barely saved from disunion during the slavery dispute at the time of the Civil War. The situation led to the establishment of the Colored Cumberland Presbyterian Church (see below). Until 1828 a general synod continued

to be the supreme judiciary, when there was constituted a General Assembly which meets annually. In 1906 a union with the Presbyterian Church in the United States was attempted, but strong opposition in the Cumberland Presbyterian Church resulted in the continuation of the Assembly and a legal fight to obtain possession of the church property.

In 1925 the denomination comprised 10 synods and 65 presbyteries, and statistics for 1925 showed 1230 churches, 754 ministers and a church membership of 64,477 and property values of \$2,837,382, which does not include \$500,000 endowment for education. There were 1400 Sunday schools with an enrollment of 48,000. Missionary work was carried on chiefly among the Indians in the U. S., but churches were also maintained in China. During 1924 a presbytery—Canton—was organized in South China having seven churches, six ordained Chinese ministers, \$150,000 worth of property, and a membership of 1047, with seven schools and about 1200 enrollment. The educational work of the denomination was conducted by the Cumberland Presbyterian Board of Education, following a merger in 1922 of the three former boards carrying on this work, viz., the Board of Trustees of Bethel College and the Cumberland Presbyterian Theological Seminary and the Cumberland Presbyterian Board of Education. Bethel College and the Cumberland Presbyterian Theological Seminary, both at McKenzie, Tenn., are the two institutions conducted by the church. The *Cumberland Presbyterian* (Nashville) is the official publication of the church. In 1925 W. E. Morrow of Worrensburg, Mo., was moderator of the general assembly, and Rev. D. W. Fooks, Nashville, Tenn., was stated clerk and treasurer. The 1925 National Meeting was held in Nashville, Tenn., and the 1926 meeting was to be held in Columbus, Miss., May 20–26, 1926.

**CUMBERLAND PRESBYTERIAN CHURCH, COLORED.** This branch of the Cumberland Presbyterian Church was legally set apart as a separate unit in 1869. In 1925 it comprised 80 presbyteries and four synods: Alabama, Kentucky, Tennessee and Texas. In this year there were approximately 150 churches; 130 ministers; a church membership of 10,000; 180 Sunday schools; with a Sunday school enrollment of 9000. The 51st general assembly of the Colored Cumberland Presbyterian Church was held at Waco, Texas, May 21–24, 1925. The Rev. A. N. McCutcheon served as moderator; Elder G. W. Sadler, as stated clerk. It was decided to hold the 52nd general assembly at Huntsville, Ala., on May 20, 1926. The *Colored Cumberland* is the organ of the church. In 1925 G. W. Sadler of Waco, Texas was the stated clerk of the general assembly.

**CURAÇAO, koo'rá-sá'ó.** A Dutch colony in the West Indies consisting of two groups of islands at a distance of about 500 miles apart, one of them comprising the islands of Curaçao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustache, and Saba. Area, 403 square miles; population, Dec. 31, 1923, 56,371, of whom 35,083 were on the island of Curaçao. Willemstad, on the island of Curaçao, is the capital and has a population of 15,703. The religious census in 1923 showed

50,902 Roman Catholics, 4861 Protestants, and 534 Jews. In 1923 the movement of population was: Births, 1997; deaths, 923; marriages, 353. In the same year there were 40 schools with 8077 pupils. The chief products of the colony are beans, maize, cattle, pulse, salt, and phosphate of lime. Oil refining is practically the only industry. The crude oil is imported from Mexico and Venezuela. The principal source of wealth is commerce. In 1923 the imports were valued at 29,547,718 guilders; the exports were valued at 18,647,351 guilders. Four thousand three hundred and fifty-two vessels of 4,687,850 tons net entered the ports. Budget for 1925: Revenue, 2,128,405 guilders; expenditures, 2,307,801 guilders (the deficit is made up by the home government). The colony is administered by a governor aided by a council and a colonial council, the members of both being operated by the sovereign.

**CURRENCY.** See FINANCIAL REVIEW; COINS, VALUES OF FOREIGN; UNITED STATES.

**CURRICULUM.** See EDUCATION IN THE UNITED STATES.

**CURZON OF KEDLESTON, GEORGE NATHANIEL CURZON, MARQUESS.** English statesman, died at London March 20. He was born at Kedleston, Jan. 11, 1859, eldest son of the Rev. Alfred Nathaniel Holden Curzon, 4th Baron Scarsdale. He was educated at Eton and Balliol College, Oxford, and became Assistant Private Secretary to the Marquis of Salisbury in 1885. In 1886 he was elected for Southport, Lancashire, which he represented in Parliament until 1898. He was Under-Secretary of State for India, 1891-92, for Foreign Affairs, 1895-98. In 1899 he went to India as Viceroy and Governor-General. In India, with devotion and energy, he aimed to develop the material welfare of the people. Lord Curzon's administration was eminently successful despite his alleged failing, a lack of caution and reserve.

In August, 1903, Curzon accepted an extension. His second term as Viceroy was marked by growing opposition. He effected the formation of the new Province of Eastern Bengal, the partition being consummated after he had left India, and lasting till 1911, when there was a practical reversal of the step. In 1903 Lord Kitchener came to India as Commander-in-Chief and sought the formation of a new Army Department in which the Commander-in-Chief should be sole head and sole spokesman in the council. The home government supported Kitchener, and in August, 1905, Lord Curzon resigned. In 1908 he became Chancellor of the University of Oxford. He was active in the Parliamentary controversy which began with the Budget of 1909 and continued until the Parliament Act of 1911. He supported Lord Lansdowne and refused to join the party of resistance under Lord Halsbury. When the War opened Lord Curzon made many speeches for recruiting and in May, 1915, in the Coalition Ministry, he became Lord Privy Seal, and later a member of the War Committee and President of the Air Board. In the Lloyd George Ministry formed in December, 1916, Lord Curzon became Lord President of the Council, Leader of the House of Lords, and a member of the War Cabinet. In October, 1919, he was appointed Foreign Secretary holding that post under the Coalition Government and afterwards in the Conservative Governments of Bonar Law

and Baldwin, until the beginning of 1924.

Curzon was active in the diplomatic situations that developed after the World War, and in particular, the difference with France over reparations. In 1923 Curzon actively opposed the occupation of the Ruhr and condemned the French position as taken by M. Poincaré, his attitude being later criticized as lacking diplomatic skill. Lord Curzon presided over the conference held at Lausanne in April, 1923, to conclude peace with Turkey. After the fall of the Conservative Government, Premier Ramsay MacDonald gathered the fruits of the negotiations Lord Curzon had initiated. Lord Curzon while not looked upon as the most skillful of British diplomats, was a man of industry, patriotism and sincerity. His manner often irritated, and he was considered difficult to deal with. Few Englishmen had received more honors. He had attained all the grades of the peerage except that of Duke. In addition to his Irish Barony, he was Earl Curzon of Kedleston, Viscount Scarsdale and Baron Ravensdale, and had succeeded his father in the 18th-Century barony of Scarsdale. In June, 1921, he was created Marquess Curzon of Kedleston. He received the Garter in 1916, the G. C. S. I. and G. C. I. E. in 1899, and the Royal Victorian chain in 1903. His first wife, married in 1895, was Miss Leiter of Chicago who died in 1906. In 1917 he married Grace Elvina Guggan, a daughter of J. Munroe Hinds, United States Minister to Brazil. He received many honorary degrees including that of D.C.L. (Oxford, 1904), LL.D. (Cambridge, 1907); LL. D. (Manchester, 1908, Glasgow, 1911); and D.C.L. (Durham, 1913). His publications include *Russia in Central Asia* (1889); *Persia and the Persian Question* (1892); *Problems of the Far East* (1894); *Lord Curzon in India* (1906); *Principles and Methods of University Reform* (1909); *Modern Parliamentary Eloquence* (1913); *War Poems and Other Translations* (1915); *Subjects of the Day* (1915); and *Tales of Travel* (1923). Shortly before his death he completed *British Government in India, the Story of the Viceroys and Government House*.

**CYCLING.** Cycling, particularly in the United States, enjoyed a banner year in 1925, capacity crowds reaching as high as 17,000 witnessing the races held in the New York Velodrome. The six-day grind in old Madison Square Garden also attracted the largest throngs in the history of this event. The season in Europe was marked by the dethroning of Peter Moeskops of Holland who had held the world's professional championship for a period of five years. Moeskops lost his title in a series of races at Amsterdam, Holland, to Kaufmann, a Swiss cyclist. The world's amateur title went to Meyer of Holland while Robert Grassin of France captured the world's motor-paced honors. The professional championship of America was won by Fred Spencer and Cecil Walker of Australia retained his all-around title. George Chapman of Newark, N. J., again won the national motor-paced competition. The Madison Square Garden six-day race resulted in a victory for the Belgian team of Gerard Debaets and Alphonse Goossens, who stole a lap in the closing hour of the contest. These same riders won the Chicago six-day race.

**CYPBUS.** An island belonging to Great Britain, situated 40 miles from the coast of

Asia Minor and 60 miles from the coast of Syria, the third largest in the Mediterranean Sea. Area, 3584 square miles; population, according to the census of 1921, 310,709, of whom 61,422 were Mohammedans. The capital is Nicosia, with a population of 18,461. In 1923 there were 774 elementary schools, 999 teachers, and 46,127 pupils of whom 36,862 were Greek Christians. The people of Cyprus are chiefly engaged in agriculture, about one-third of the arable land being under cultivation. Forestry and the cultivation of the vine are rapidly taking an important place in the production of wealth on the island. The principal agricultural products are: Wheat, barley, oats, potatoes, linseed, cotton, animal products, and fruits. Asbestos and copper are mined and exported in considerable quantities.

The *Journal* of the London Chamber of Commerce published the following statistics for the exports from the island in 1924: asbestos, 87,442 hundredweight, value, £80,070; raisins, valued at £55,294; silk cocoons, valued at £34,204; cotton, valued at £34,004; oranges and lemons valued at £25,920; wool, 5980 hundredweight, £24,063; chrome iron ore, 2811 tons, valued at £9595; onions, 36,024 hundredweight, valued at £6834. Other exports listed were sponges, flax, tobacco, linseed, and wine. In 1923 the imports totaled £1,072,485. The chief articles of import were cotton and woolen manufactures and provisions of all kinds. The shipping entered and cleared in 1923 was 904,611 tons, a decrease of approximately 45,000 tons over the year previous. The budget for the calendar year, 1923, was as follows: Revenue, £567,389; expenditure, £582,699. The island was administered under a convention with Turkey by Great Britain after June 4, 1878, and was annexed by Great Britain at the outbreak of the war with Turkey, Nov. 5, 1914, and is under a high commissioner having the usual power of a colonial governor, aided by an executive council and a legislative council of 18 members of whom six are office-holders and the remainder elected for five years, nine of them by non-Mohammedan voters and three by Mohammedan voters. High Commissioner at the beginning of 1925, Sir Malcolm Stevenson.

**CYRENAICA.** An Italian colony on the north coast of Africa, which until 1919 formed a part of Libya. In that year, for administrative and military purposes, Libya was divided up into Cyrenaica and Tripolitania (q.v.). Area, estimated at 230,000 square miles; population, according to the census of 1921, about 220,000 natives and 9719 Europeans (9402 Italians). The principal town is Benghazi, with a population of 30,000. Agriculture is the chief industry of the people, although there are vast possibilities for cattle raising. In 1922-23, 285,750 acres were sown with barley (the chief food of the people), and 25,625 acres with wheat. The internal commerce consists mainly of a caravan trade between Benghazi and Wadi. The imports in 1922 amounted to 76,049,886 lire and the exports, 9,776,563 lire. The revenue and expenditure for the year 1923-24 were estimated at: Colonial revenue, 111,905,000 lire; civil expenditure, 42,625,800 lire; military expenditure, 69,281,000 lire. Governor at the beginning of 1925, Gen. Ernesto Mombelli (appointed May 4, 1924).

**CZECHO-SLOVAKIA,** chěko-slova'kia. A

republic in eastern Europe, formed Oct. 28, 1918, out of the Slav regions of the old Austro-Hungarian monarchy; formally declared a republic Nov. 14, 1918, and comprising the former Austro-Hungarian provinces of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czecho-Slovakia at the Ambassadors' Conference, July 28, 1920. Capital, Prague.

**AREA AND POPULATION.** The total area of Czecho-Slovakia is 54,191 square miles. The population according to the census of Feb. 15, 1921, was 13,613,172. By race it was distributed as follows: Czecho-Slovaks, 8,760,937 (65.3 per cent); Germans, 3,123,568 (23.3 per cent); Magyars, 745,431 (5.5 per cent); Russians, 461,849 (3.4 per cent); Jews, 180,855 (1.3 per cent); Poles, 75,853 (0.5 per cent); miscellaneous, 25,871 (0.2 per cent). The Czecho-Slovaks and Germans made up almost exclusively the population of Bohemia and Moravia, and the Czecho-Slovaks about half of Silesia and more than two-thirds of Slovakia. The largest cities with their populations in 1921 are: Prague, 676,657; Brno, 221,758; Ostrava, 113,709; Bratislava, 93,189. The majority of the people are Roman Catholics, who numbered 10,384,823 in 1921.

**EDUCATION.** Instruction is compulsory between the ages of 6 and 14. On Dec. 31, 1922, the public and private elementary schools numbered 13,775, with 885,151 boys and 903,688 girls; the advanced public and private schools numbered 1615 with 154,798 boys and 137,166 girls. During 1923-24 there were 382 secondary Latin and technical schools with 109,479 pupils; during the same period the public or state-aided schools of commerce numbered 158 with 23,153 students. There are four universities as follows: Prague (Czech), with 8150 students in 1922-23; Prague (German), 3093 students; Brno (Czech), 1432 students; Bratislava (Slovak), 631 students.

**PRODUCTION.** The soil of Czecho-Slovakia is among the most fertile of Europe and industry is highly developed. Agriculture has reached a high stage and is intensively carried on. The area and yield of the crops in 1922 and 1923 are shown in the following table taken from the *Statesman's Year Book* of 1925:

Crops	Area in acres		Yield in metric tons	
	1922	1923	1922	1923
Wheat . . .	1,529,477	1,506,924	915,025	985,913
Rye . . . . .	2,178,062	2,125,356	1,297,936	1,354,860
Barley . . .	1,669,806	1,696,868	1,009,202	1,197,093
Oats . . . .	2,021,019	2,081,808	1,038,581	1,330,801
Potatoes . .	1,606,944	1,573,075	9,069,162	6,224,275
Sugar-beet .	519,539	574,415	5,240,149	6,024,369

Mineral products include soft and hard coal, iron, graphite, gold, silver, lead, rock salt and garnets. The coal output in 1923 was 16,265,530 tons of lignite and 12,347,251 tons of anthracite. On Jan. 1, 1924, there were 378 coal mines with 118,011 employees. The small demand of the local market, heavy taxation, high freight rates, and the high cost of labor have seriously hampered the development of manufacturing in Czecho-Slovakia. In 1922 there were 11,184 factories distributed as follows: Textile mills, 2006; glass works and stone factories, 2040; factories for food production, 1856; furniture and bent wood manufacture, 1198;

machine factories, 793; metal manufacture, 857; paper mills, 349; and chemical factories, 612.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, foreign trade figures for 1924 showed a favorable balance of 1,160,000,000 crowns, accompanied by a great increase in exports during the last three months of the year as compared with the previous six months. The principal increases in imports, were occasioned by heavy purchases of high-priced grain and flour and textile raw materials. During the year the principal recipients of Czecho-Slovak exports were Austria, whose takings were valued at 3,523,000,000 crowns; Germany, at 3,317,000,000; Great Britain, at 1,586,000,000; and Hungary, at 1,134,000,000 crowns. Principal imports were received from Germany to the amount of 5,583,000,000 crowns; from Austria, 1,245,000,000; from Italy, 989,000,000; and from the United States, 889,000,000 crowns. A large part of the imports credited to Germany and Italy, are, however, transit shipments of raw materials originating in the United States and elsewhere. During the 12 months of 1924, according to preliminary figures, exports amounted to 17,022,000,000 crowns as compared with 12,573,000,000 crowns for 1923. Even the great proportional increase in imports from 10,129,000,000 crowns in 1923 to 15,862,000,000 crowns in 1924, although reducing the export surplus to approximately 42 per cent of the previous year, may nevertheless be attributed to healthy causes, such as greater raw material requirements for export industries and for enlarged domestic consumption. During 1924 the restrictions on imports and exports were considerably relaxed. Lower rates of duty were provided on a large number of commodities through negotiation of commercial treaties. Most-favored-nation treaties or temporary agreements have been negotiated with France, Italy, Austria, the United States, Denmark, Germany, Greece, the United Kingdom, the Netherlands, Iceland, Latvia, Lithuania, Norway, Portugal, Rumania, Spain, and Switzerland.

**FINANCE.** The 1925 budget provided for revenues of about 15,700,000,000 crowns and expenditures of 15,900,000,000 as compared with a revenue of 16,400,000,000 crowns and an expenditure of 16,900,000,000 crowns in 1924. The efforts of the government to reduce the budget were partially offset by its wage increases to bureau employees necessitated by the higher cost of living. Considerable criticism was directed at the high per capita taxation, which amounted to 600 crowns for State taxation and approximately 350 crowns additional for communal and other taxes—a total of about \$28.58. This compares with a per capita tax of \$47.64 in Germany. In Czecho-Slovakia, as in all Central European countries, credit stringency dominated business in 1924—with this distinction, however, that in Czecho-Slovakia financial tension was created less by domestic factors than by the influence of the neighboring money markets of Germany, Austria, Hungary, and Poland.

In these countries stabilization of currency and budget uniformly revealed an absence of liquid capital and caused pressing demands for credit, and this increased the interest rates to a point where Czecho-Slovakia's short-time capital was withdrawn into the neighboring mar-

kets. These credit exportations resulted in reduced exchange reserves in the Czech Central Banking Office, and consequently in reduced circulation of currency and restriction of credits. The resulting lack of operating capital in Czecho-Slovak industries in some cases made it impossible to meet liabilities. Financial catastrophe, brought on by these external causes, was avoided with the greatest difficulty. The total national debt in 1924 was 26,526,417,456 crowns, made up as follows: Internal debts, 21,173,521,400 crowns; external debt, 1,052,896,056 crowns; liabilities arising out of peace treaties, 4,300,000,000 crowns.

**COMMUNICATIONS.** The Czecho-Slovak railway system comprised 8239.36 miles of track, to which in 1924 was added the new Zvolen-Krupina line in Slovakia (21.75 miles long). In the total mileage of the country 2631.50 miles were privately owned, but were operated by the state, being lines of secondary importance.

**GOVERNMENT.** Under the constitution passed by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers, and legislative power in a senate of 150 members and a chamber of deputies of 300 members, the former elected by all citizens over the age of 26, and the latter by all citizens over the age of 21. The principle of proportional representation is applied. President at the beginning of 1925, Thomas G. Masaryk (elected May 28, 1920). The ministry at the beginning of 1925 (appointed Oct. 8, 1922) was as follows: Prime Minister, M. Svehla; Foreign Affairs, Eduard Benes; Interior, M. Malypetr; Finance, Theodore Bečka; Commerce, Ladislav Novak; Public Works, M. Srba; Food Supplies, Dr. Franke; Railways, M. Stifbrny; Health, M. Srámek; Social Welfare, Gustav Habrman; Justice, Jan Dolansky; Agriculture, Dr. Hodza; Education, M. Bechyně; National Defense, F. Udržal; Posts and Telegraphs, Dr. Franke; Unification of Laws, Dr. Marković; Minister for Slovakia, Dr. Kallay.

## HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** Parliament at the opening of the year was struggling with several economic, social, and religious problems which seemed for a time to jeopardize the coalition ministry. The chief problem was the relation of the State to the Church. The new government of Czecho-Slovakia was closely connected with the Roman Catholic Church, a connection which was an inheritance of pre-war conditions and one which the government was very anxious to sever. Efforts to bring this about resulted in a pastoral letter from the Slovak bishops banning membership in anti-church organizations including five of the parties which were a part of the government coalition. President Masaryk stated that he believed the proposed separation would strengthen both agencies, but his words did not sound very convincing to the Catholic element who promised to fight the scheme to the bitter end. Other problems under discussion at the beginning of the year were social insurance for persons in independent occupations, reduction of taxes, and customs tariffs.

From the international standpoint an interesting situation was created when Jugo-Slavia

took the leadership of the Little Entente in forming an anti-Bolshevik bloc. Observers believed this was an indication that the position of leadership of Czecho-Slovakia in the Little Entente was at stake and that Jugo-Slavia was much closer to Rumania than to Czecho-Slovakia and might be willing to make the Little Entente a Balkan alliance to the complete exclusion of Czecho-Slovakia.

**TREATY WITH POLAND.** In April a commercial treaty between Czecho-Slovakia and Poland was successfully negotiated. Although denied by Foreign Minister Beneš, the rumor persisted that this was to be followed by an alliance between the two countries or that possibly Poland might join the Little Entente. The commercial treaty was on the most-favored-nation basis and made mutual tariff concessions which should be of considerable benefit to both countries. A railway provision called for transit considerations for Polish goods going to Italy, Austria, and Hungary and for Czecho-Slovakian goods going to Russia.

**DISARMAMENT.** The period of military service after 1924 was to be limited to 14 months. Until 1923 it had been two years and during 1924 18 months. From 1924 through 1927 the number of soldiers was limited to 150,000 in winter months and 90,000 in the summer months. The percentage of the 1924 budget for military needs was 13½ as compared with 20 in 1919. According to the government, Magyar nationalism, Hapsburg monarchism, and seeming indifference on the part of other powers prevented the further reduction of the armed forces.

**LITTLE ENTENTE.** The semi-annual meeting of the Little Entente was held in Bucharest from May 9 to May 12. Under the leadership of Beneš, the group went on record as being opposed to any union between Austria and Germany, although stating at the same time that it was ready to assist in the financial and economic rehabilitation of both Austria and Hungary. Dr. Beneš suggested an extension of the Little Entente to include France and Belgium as an alternative to the plan provided by the Geneva Protocol.

**RELATIONS WITH THE VATICAN.** As noted above, the attempt on the part of the government to separate the Church and State was bitterly opposed by the Vatican. On July 5 and 6 a general celebration was held in commemoration of the martyrdom of John Huss. The government officially participated in the activities although claiming that no affront was meant to the church. The Pope recalled the papal nuncio from Prague and a short time after the government recalled the Czecho-Slovak Minister accredited to the Vatican. M. Stříbrný, Minister of Railways and Dr. Franke, Minister of Posts and Telegraphs, resigned from the cabinet as a result of the controversy. Parliament adjourned until September in order to prevent a crisis.

**ELECTIONS.** The dispute with the Vatican had the effect of forcing new elections for both houses of the legislature although the Chamber of Deputies should have lasted into 1926 and the Senate for another two and a half years. General elections took place on November 15 and 22. The results were generally favorable to the government coalition, although its majority in the lower house was reduced slightly. The members of the coalition are the Agrarians, So-

cial Democrats, National Socialists, National Democrats, and the Clerical Party. Before the dissolution of parliament this group had 173 members as compared with 121 belonging to the opposition. After the election the figures were 159 and 141. Because of this comparatively small majority, Premier Švehla offered his resignation but President Masaryk induced him to remain at the head of the government. In the elections 20 parties offered 5129 candidates for the 442 seats in the legislature. This is an indication of the tendency for a major party to break up into minor groups, which form parties of their own, adopting new names and platforms. The communist and bourgeois parties gained tremendously in the elections while a notable falling off was observed in the labor group.

**DAHOMÉY, dá-hō'mí.** A French colony on the west coast of Africa between Togoland on the west, the British possessions of Lagos and Nigeria on the east, and the French military territories on the north. It is a subdivision of the colony of French West Africa (q.v.). The coast line is only about 70 miles long. Estimated area in 1921, 42,460 square miles; population, 842,243, of whom 538 are Europeans. The seat of the government and the chief centre of trade is Porto Novo with a population of about 20,000. The population is of pure negro blood, and belong to the Ewe family. They are very industrious and engage mainly in agricultural pursuits. In the coastal region they raise potatoes, corn, manioc, and yams. In the central provinces cotton culture has been introduced. The forests contain oil palms of commercial importance. The imports in 1923 were valued at 62,631,469 francs and the exports at 56,207,379 francs. The chief exports are palm oil and palm kernels. For 1924 the local budget was 11,160,000 francs. There is a meter gauge railway about 250 miles long, with a contemplated extension of 400 miles. There are 1389 miles of telegraph line and 70 miles of telephone.

**DAIRYING.** The dairy situation in 1925 was more favorable than in the preceding year. The heavy 1924 production, with the consequent large reserve supplies in storage in the fall of 1924, had a depressing effect on prices during the early months of 1925, but production was not as heavy and the demand was strong. Butter averaged 5.4 cents higher per pound during October, 1925, than in October, 1924, and a similar difference was maintained through a large part of the year, but the difference was reduced to 3 cents in November. Butterfat prices were estimated to be 10.5 cents higher in the same months.

American dairy interests were very much concerned with the foreign dairy situation, due especially to the possibility of butter being shipped into the United States from the countries of the Southern Hemisphere. Some butter from Argentina arrived and New Zealand butter was received in San Francisco, but the strong European market and the American tariff prevented the possibility of very large amounts being imported.

The amount of butter in storage on November 1 was greatly reduced as compared with the preceding year. The estimate was 95,983,000 pounds as compared with 135,018,000 pounds in 1924. The storage of American cheese was

slightly heavier, the estimates being 68 million pounds on Nov. 1, 1924, and 72 million pounds on the corresponding date of 1925. There was about 5 per cent more canned milk in storage than last year.

The estimated butter production for the ten-month period, January 1 to November 1, was 1,646,986,000 pounds in 1925 and 1,720,414,000 pounds in 1924. The net imports of butter during these periods were, respectively, 1,752,000 and 11,342,000 pounds, or a total decrease of supplies in the 1925 period of 83,018,000 pounds. There was, however, 35,358,000 pounds more butter in storage on Jan. 1, 1925, than at the corresponding period of 1924.

The exports of dairy products from the United States during the year were not as heavy as in the previous year, except for cheese. Total canned milk exports decreased from 83,810,053 pounds in the first 10 months of 1924 to 132,954,623 pounds in the corresponding period of 1925. As in 1924, Germany, the United Kingdom, Cuba, and the Philippine Islands received the largest amounts, but all except the Philippine Islands showed decreases. The amounts for the respective periods in 1924 and 1925 were Germany 55,975,748 and 31,280,313 pounds, United Kingdom 27,208,723 and 25,692,204 pounds, Cuba 30,984,382 and 16,709,828 pounds, and Philippine Islands 13,293,571 and 15,259,721 pounds.

Butter exports of the United States decreased from 7,191,898 pounds in the first 10 months of 1924 to 4,560,047 pounds in the same period of 1925. The greater part of this decrease was due to the entire cessation of exports to the United Kingdom, whereas 2,238,451 pounds were exported in the period of 1924. The exports of cheese were more than doubled, the amount in the 1924 period being 3,201,685 pounds as compared with 8,464,409 pounds in 1925. The increases in the cheese exported went largely to Germany and Canada, the former receiving over 3,000,000 pounds more and the latter over 1,000,000 pounds more than in 1924.

The imports of dairy products were similar to 1924, except for a decrease from 18,533,858 pounds to 6,312,502 pounds of butter for the ten-month period of 1925. The cheese imports were slightly increased from 47,544,312 pounds to 49,243,279 pounds, due largely to increases of from 1 to 2 million pounds each in the special types of cheese from Italy, France, and Switzerland.

**INTERNATIONAL CONDITIONS.** The feature of the international situation during the year was the absorption of unprecedented quantities of butter and cheese by the European importing countries. Such heavy importations tended to keep prices in foreign markets lower than in New York, thus entirely preventing exportation from the United States and at several different times threatening the shipment of butter from the Southern Hemisphere to the United States. London butter prices were, however, from 4 to 8 cents lower than New York prices throughout most of the year.

New records for importations were made for the United Kingdom and Germany. During the first nine months of 1925 the United Kingdom imported 524,000,000 pounds of butter and 264,000,000 pounds of cheese. The annual importations for the 1909-1913 period averaged 455,000,000 pounds of butter and 257,000,000 pounds

of cheese. The butter imports of Germany during the first nine months of the year were 166,280,000 pounds as compared with 111,441,000 pounds, the average yearly importation for 1909-1913. Cheese imports showed a greater increase. During the first eight months of 1925, 113,864,000 pounds of cheese were imported into Germany as compared with an average of 48,687,000 pounds for the years 1909-1913. It was expected that the German tariff would materially reduce butter importations, but in October, the first month in which the tariff was operative, 19,841,400 pounds of butter were imported, which was well above the monthly average.

The October imports of butter and cheese into the United Kingdom were much less than in the preceding year, being estimated at 77 and 87 per cent, respectively. This decrease was mainly due to a late cold spring in Australia and New Zealand and to the strike of British seamen. This strike was practically ended in New Zealand by the latter part of October and in Australia about one month later. The effect of these conditions reduced the butter exported from New Zealand and Australia to the United Kingdom from nearly 10,000,000 pounds in October, 1924, to less than 3,000,000 pounds in October, 1925.

A movement was inaugurated in England to stimulate the use of Dominion agricultural products. One million pounds sterling was appropriated for this purpose. This movement resulted in very strong competition for Danish butter, and favored the rapidly growing dairy industry in New Zealand and Australia. According to the *Butter, Cheese, and Egg Journal*, Dec. 16, 1925, the amount of Danish butter imported by the United Kingdom was materially reduced as compared with previous years, while the imports from the colonies were much increased.

The amounts of butter received by the United Kingdom from these countries during the first eight months of 1923, 1924, and 1925 were as follows:

	Denmark	Australia	New Zealand	Canada
1923..	140,401,408	50,881,040	104,858,544	482,832
1924..	130,937,296	46,471,824	93,282,783	1,544,704
1925..	124,804,736	102,413,136	122,735,648	4,812,080

The Danish butter decline was partly due to a diversion of this butter to Germany. New Zealand and Australia took active steps to regulate and improve the quality of dairy produce exported in the 1925-26 season, the actual effects of which have not yet become apparent.

The recovery of dairying in Russia was evident, as it was estimated that 55,000,000 pounds of butter were exported during the 1925 season. Favorable conditions were reported from Argentina, indicating the availability of large amounts of butter for export in the 1925-26 season. Latvia also increased butter production, the estimated amount exported in the first nine months of 1925 being 11,500,000 pounds as compared with 5,900,000 pounds in the corresponding period of 1924. The exports of butter and cheese from Canada also showed large increases.

**RESEARCH.** Investigational work in dairying was continued much along the same lines as in previous years. In nutrition experiments at the Missouri Experiment Station the protein requirements for the growth of dairy heifers were

found to be considerably less than the requirements ordinarily given in feeding standards. Several of the State agricultural experiment stations carried on studies upon the value of different proteins for milk production. In these experiments legume hays were frequently compared. Considerable effort was expended in the States where this plant is easily grown in determining the feeding value of soy bean products. Very extensive digestion experiments dealing with the value of the proteins of peanut meal, cottonseed meal, and soy bean meal for milk production were conducted at the Virginia Polytechnic Institute, and comparisons of these feeds with linseed meal were also made at other institutions.

Research work in the manufacture of the various dairy products was continued, especially with the bacteriological and chemical phases. Several of the institutions studied the effects of different ingredients on the freezing properties and quality of ice cream, and many difficulties in the manufacture of this product were solved. The Bureau of Dairying of the United States Department of Agriculture made considerable progress on a project dealing with the utilization of dairy by-products, finding it possible to remove a large percentage of the sugar from whey by crystallizing the sugar out at a temperature near the freezing point. A soluble albumin practically free from lactose and containing only 2.8 per cent ash was obtained. Methods were devised for the removal of salt from the whey.

**BIBLIOGRAPHY.** The more important books on dairying recently published include: *Swiss Bovine Breeds* (Schweizer Rinderrassen [Muri]; Komm. Schweiz. Viehzuchtverbände [1924]); L. J. Lord, *Practical Butter and Cheese Making* (London, 1925); G. S. Thomson, *Butter and Cheese* (London, 1925); J. T. Bowen, *Dairy Engineering* (New York and London, 1925); M. Case, *Pasteurization of Milk* (New Rochelle, N. Y., 1925).

**DALMATIA.** A crownland of Austria until the downfall of the Dual Monarchy in 1918; since then a province in the new state of Yugo-Slavia. It extends from Bosnia and Herzegovina west to the Adriatic Sea. Area, 4916 square miles; population at the end of 1920, 621,429. Capital, Zara, with a population according to the census of Jan. 31, 1921, of 18,060.

**DAMS.** During the year, in order to provide for various irrigation and power projects, both in the United States and in other countries, there was under way considerable new dam construction. Furthermore with such power developments it was confidently believed that work of this kind would become increasingly prominent. Under the auspices of the Engineering Foundation, the new experimental arch dam on Stevenson Creek, Calif., was commenced, while the various water supply projects that municipalities the world over were considering, naturally involved new dams and reservoirs. In the work of the year, while a number of the dams built were of considerable magnitude, there was not much to be recorded in the way of unusual design or record size.

**AMERICAN FALLS DAM.** On January 23 the Secretary of the Interior authorized The Bureau of Reclamation to make a contract with the Utah Construction Company for the construction of the American Falls Dam across the

Snake River, at American Falls, Idaho. This dam is a concrete gravity section dam, 3132 feet long with an earth embankment approximately 400 feet long on the right end and an earth embankment approximately 500 feet long on the left end, or a total length of 4032 feet. The connection between the concrete gravity and earth embankment sections will be made by counterforted concrete retaining walls. The spillway portion was to consist of an overflow concrete gravity section 648 feet in length with 18 radial gates, 33 feet wide and 10 feet high. These radial gates were to be operated by hoisting machinery placed in a gallery within the body of the dam. The irrigation outlets were to be controlled by twenty 5-foot square hydraulically operated slide gates. Provision was to be made for the future installation of penstocks for hydroelectric power development, but no power development was included in the contract awarded. The contract provided for a dam that would supply storage for 1,040,000 acre feet with the river section built on a base below elevation 4300 feet for a dam for the storage of 1,700,000 acre feet. The other portions of the dam would be the same in either case but the government reserved the right to change from a low dam to a high dam with an increase of about 13.2 feet in height and an increase in volume of mass concrete from approximately 107,000 cu. yds. to approximately 156,000 cu. yds., with other quantities in proportion. During the year construction work was vigorously prosecuted, the gate section within the cofferdam being well advanced as was the work on the left penstock section. Excavation for the core wall foundation at the right embankment was well advanced by December and embankment material was being placed and rolled.

**TIETON DAM.** On July 2 the Secretary of the Interior dedicated the Tieton Dam on the Yakima project, Washington. This dam, originally known as the Rimrock Dam, had been under construction 10 years and created a reservoir with a capacity of 202,500 acre-feet located in the Mt. Rainier National Forest on the Tieton River, about 26 miles above Naches, Washington. The dam was built of earth, heavily blanketed with rock and was 230 feet high and 900 feet long on the crest, with a concrete core wall of an approximate height of 330 feet extending from solid rock to the crest. Work was well under way on this project in 1917, but it was shut down in the spring of 1918 on account of the War until April 1, 1921, when an appropriation of \$675,000 was made, which enabled work to be resumed. During the construction of the dam a diversion tunnel 2200 feet in length, diameter approximately 21 feet, was constructed to carry the waters of the Tieton River and later to be used as a portion of the outlet control system. This tunnel was driven through a solid cliff of andesite rock. The core wall of the dam consists of a concrete diaphragm completely closing the canyon and tied well into the bedrock on the base of the sides. Below the ground surface it is 5 feet thick with no reinforcing, while above the ground it tapers to 1 foot in thickness, at the top of the dam, being heavily reinforced and without expansion joints. The embankment, which has a maximum height of approximately 230 feet, consists of a hydrau-

lic wall cemented with rock. The crest is 900 feet long with a 3 to 1 slope on the upstream side, 25 feet wide on the top, and a 2 to 1 slope on the downstream side. The volume of the embankment was approximately 2,000,000 cu. yds. In the rock cliff on the west side of the canyon a spillway was built with an overflow lip 420 feet long, with a capacity under normal conditions of 30,000 second-feet, and with a capacity of 50,000 second-feet before the dam would be overtopped. There are six drum gates of the Arrowrock type, 65 feet long and 8 feet high.

**McKAY DAM.** Another important dam under construction by the United States Bureau of Reclamation in 1925 is located on McKay Creek about 500 miles above the confluence with Umatilla River 7 miles south of the town of Pendleton, Oregon. This dam, when completed, will create a reservoir about 4 miles long and 1 mile wide, with a storage capacity of 73,000 acre-feet, the stored water being used to supplement the natural flow of the Umatilla River for irrigating lands partially developed. Construction work was begun in July, 1923, and the project consists of three main features, the gravel fill, the spillway, and the outlet tunnel. The gravel fill has a top length of 2700 feet, a maximum height above the creek channel of 165 feet and 2 to 1 downstream slope, a 1½ to 1 upstream slope and would contain when complete, 2,300,000 cu. yds. of material, consisting of a well graded gravel containing a varied content of earth and sand. The upstream slope was to be entirely covered by a layer of continuous concrete reinforced with ¾ inch round rods spaced 18 inches centres both ways, the thickness of the layer varying uniformly from 12½ inches at the top stream toe of the fill to 8 inches at the parapet wall at the top of the dam. A concrete cutoff wall is located along the upstream toe face for the full length of the dam and it is here that the concrete face terminates.

The spillway is located in lava rock at the right abutment at the end of the gravel fill. It is of the side-channel type, the channel being lined with concrete. The flow into the spillway channel is controlled by a concrete gate structure containing six 20x10 feet radial gates and a two-barrel siphon spillway. The spillway is designed to pass 10,000 cubic feet, in addition to which a liberal allowance for freeboard is made. An outlet tunnel 705 feet long, lined with concrete for its full length was driven through the lava rock under the right abutment of the dam, being used during construction to divert the natural flow of the creek around the embankment. After the completion of the dam, the tunnel was to be equipped with gates and apparatus for controlling the release of the irrigation draft from the reservoir. The emergency gates with cover 4x4 foot openings are located in the tunnel 550 feet from intake portal. They are of the plain sliding type, piston operated with oil under pressure. With a considerable amount of embankment material being placed and rock excavation carried on in the spillway channel and at the spillway gate site, it was anticipated that the McKay dam would be completed late in 1926 and that water might be stored for the irrigation season of 1927.

**GILBOA DAM.** During the year there was progress towards completion of the Gilboa Dam constructed across Schoharie Creek to increase New York's water supply from the Catskills. This dam has been described in previous issues of the YEAR BOOK (see YEAR BOOK, 1919 and 1922) but again may be mentioned as it was found necessary during the year to flatten the slopes of the dike from one on three with berms, originally planned to one on five without berms, in order to accommodate the material which was available. This action was taken in view of the fact that movements of the material were in evidence during the summer, which were discussed in the New York daily papers. The flattening of the slopes in accordance with this plan, however, brought about a stabilization of the work and at the end of the year the project was nearing completion so that the steam control opening would be closed some time in 1926 and the Schoharie Reservoir put into service.

**WANAQUE DAM.** The construction of the dam closing the channel of the Wanaque River and forming a reservoir, developing a water supply for Newark, Paterson, Passaic, Clifton and neighboring communities progressed actively during the year. There was involved a main earth dam containing 830,000 cu. yds. of embankment with a concrete core. This main dam closed the channel of the Wanaque River, but at low places on the rim of the reservoir formed by the Wanaque Dam, were five other dams, two of concrete and three of earth with core walls. The three earth fills aggregated about 120,000 cu. yds. The concrete in all the various dam core walls and other structures amounted to 77,000 cu. yds., of which 33,000 cu. yds. was in the main dam. The main dam closes the valley of the Wanaque where it is 1500 feet in width with a rock out-cropping on both bluffs, but dipping at the bottom of the valley to 100 feet below the surface. The concrete core wall in the centre of the earth embankment goes down to bedrock. The construction of this dam was notable as it involved the greatest footage of belt conveyor ever operated on a construction job. Nearly 2½ miles of conveyor were employed, while the excavation and the fill and miscellaneous haulage were all mechanical devices, there being no animals working within the reservoir site. Tractors, trailers, elevating graders, gasoline blade graders, steam rollers and steam shovels were making the excavation at the various borrow pits and conveying the material to the embankment where it was placed.

**OHIO RIVER DAM AT LOUISVILLE.** During the year the War Department approved the plan for increasing the height of dam No. 41 across the Ohio River at Louisville. This dam was to be built by the U. S. Army Corps of Engineers and by raising the height of its crest 41 feet, it would obviate the need for a navigation dam at Madison, Ind., 50 miles upstream; furthermore, it would make possible the development of 350,000,000 kw. hours of electricity. It was provided that a power should be developed and machinery installed to generate 100,000 horse power. The hydroelectric development involved an expense of \$7,500,000. Power thus would be available late in 1928 or early in 1929. See YEAR BOOK 1922.

During the year the Guernsey Dam, one of the large projects of the United States Board of

Reclamation, in Wyoming, was actively pushed forward, the diversion tunnel being extended and excavation made for the foundation trenches of the cutoff wall and for the spillway on the north side. Progress was made in 1925 on the Pitt River No. 3 power development of the Pacific Gas and Electric Company, in California. A unique feature of the dam was the construction of baffle piers in the toe of the dam to reduce the energy of overflow water. One of the dams proposed during the year was across the North Fork of the Mokelumne River, Calif., in connection with a power development. There would be a rock-fill dam, approximately 200 feet high and 960 feet long. From this would lead 25 miles of conduit made in part in open ditch, flume and tunnel, developing at the power plant a static head of 1247 feet in two double overhung impulse wheels of 10,500 horse power capacity each.

During the year construction was started on the \$500,000 storage power dam on the Muskosh River in the Muskoka Lakes district of Ontario. This dam will control the flow from the Muskoka Lakes basin and link up this power with the Eugenia-Severn system. An important water storage dam was contracted for during the year by the Province of Quebec, Canada, to be built a few miles north of Maniwaki, Quebec. This dam would flood an area of 16,000 square miles.

**TIDONE RIVER DAM, ITALY.** For the irrigation of 10,000 acres in Italy, between the Apennines and the River Po, there was under construction during the year a multiple-arch dam of unusual type, across the Tidone River about 38 miles southeast of Milan. This dam had a height of 53 meters, 170.6 feet and was 722 feet in length. The project involved the building of a main dam for the regulation of the Tidone River, affording a reservoir of 10,125 acre-feet and a second structure, 148 feet in height, built across one of the lower affluents, the Tidoncello, with a capacity of 4131 acre-feet. The design of this dam calls for arches inclined at an angle of 45 degrees with the horizontal and circular in a plane normal to their line of inclination. These arches are semi-circular and have a constant upstream radius of 16.4 feet. They vary in thickness from 1.15 feet at the top of the dam to 3.61 feet at the stream bed. There are also buttresses spaced 32.8 feet centre to centre, with a thickness varying from 2.30 feet at the top to 7.22 feet at the stream bed, the increase in thickness occurring in steps. These buttresses in the design assumed, were to be independent of arches and received as loads their dead weight, the weight of the arches and the water pressure. The work was carried on by the building of a cement plant at the site, the cement being tested before use and combined with material in the neighborhood to form the concrete.

**BARHERINNE DAM.** In Switzerland, no less than in other European countries, important water power developments were under way and one of the notable constructions of the year was the Barherinne Dam in the Swiss Alps. This was a high masonry structure.

**FAILURE OF WELSH DAM.** One of the notable dam failures of the year was an old concrete dam about 3 miles from the town of Dolgarrog, in North Wales, which was overtopped on the

evening of November 2. The discharge of water carried away an earth dam below and nearer to the town and the water thus released from the river flowed down a steep hillside, carrying great masses of earth and huge boulders into the town, with the result that 16 persons were killed and a large amount of damage done. In addition the flood waters submerged the generators in the power house, causing darkness over the entire area, and also entered the plant of the Aluminum Company, causing an explosion in the reduction furnaces. The upper dam, forming a reservoir at Lake Eigiau, was L-shaped in plan and consisted of 3300 feet of gravity section, concrete wall with 1300 feet of low embankment at one end. This dam raised the surface of the lake and gave a capacity of about 160,000,000 cubic feet, and supplied a reservoir for the North Wales Power Co. It was completed in 1910-11. The concrete wall had a maximum height above ground level of 20 feet and the failure was caused by undermining a breach about 30 feet long and 10 feet high, extending up into the concrete wall itself, being washed out under the dam. This was at a point where work of two periods of construction, separated by an interval of a couple of years, joined. The footings were inadequate and the concrete work was poor; the dam had leaked considerably previous to its failure. About 300 feet below the Lake Eigiau dam was Lake Coedty, which was about 900 feet above the town of Dolgarrog. Its dam was an earth fill structure with a concrete core wall, having a spillway designed for maximum flood flow conditions. This dam was inadequate for the flood let loose by the failure of the dam above and it was overtopped and washed out. Many buildings were washed out. The reduction furnaces and power house of the Aluminum Corporation were put out of operation and a stretch of highroad was entirely destroyed. It was evident from the examination of the engineers, subsequent to the disaster, that the failure was due to criminal neglect on the part of those who had built or supervised the original structure.

**ARCH DAM INVESTIGATION.** Further progress was made during the year on the construction of the proposed test dam on Stevenson Creek near Fresno, Calif., under the auspices of the Engineering Foundation. This dam, it will be recalled, see YEAR BOOK 1923 and 1924, was for the purpose of testing, to destruction if necessary, a typical design of Arch Dam and making a suitable measurement under various conditions. On November 1st the construction camp had been built, machines for excavation and placing the cement had been installed, and 1274 cubic yards of rock had been excavated, preparing the site. The research committee of the Engineering Foundation in charge of this investigation, of which Prof. Charles Derleth, Berkeley, Calif., was Chairman, and F. A. Noetzli, Los Angeles, Calif., is secretary, issued during the year a general statement of the tests and measurements to be made. The dam was being built to give precise information, on working scale, concerning the stresses, movements and changes of volume of thin arch dams, the theory of which was stated to be not in completely satisfactory condition. An attempt will be made to determine whether the stresses were

according to the calculations, and whether the cracks developed were anticipated. The experiment, according to the committee was expected to supply partial answers to some or all of the following points of question: (1) As to stresses: division of the water pressure between the different resisting elements; arching in inclined planes, and secondary arching in interior of thick arches; horizontal stress variation between crown and abutment of arch elements; applicability of common theory of flexure to thick triangular cantilevers; shear deformation in cantilever beams. (2) As to temperature and distortion effects: variation in temperature change from upstream to downstream face; relation between temperatures of air, water and concrete; shrinkage due to setting; swelling due to moisture; flow of concrete under sustained load; effect of lateral deformation; yielding of foundation and abutments. (3) As to construction influences: effect of vertical construction joints or cracks; effect of horizontal cracks on cantilever action; effect of water pressure in horizontal cracks or construction joints; importance of uniformity of concrete, arrangement and preparation of construction joints, and difference of age between successive horizontal sections. In the course of this work, strains, deflections and temperature measurements will be made at as many points as practicable and these will be reported at various intervals.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANZIG.** A free city which, with its surrounding territory, was established by the Treaty of Versailles in 1919. It was formerly a part of the German Empire. Area, about 754 square miles; population, Aug. 24, 1924, 386,000, of whom about 4.4 per cent were Poles. The administrative district of the city of Danzig had a population of 207,100. The city is the chief outlet for the commerce of Poland and continues to maintain its centuries-old position of being the leading grain port of the Baltic. The elementary schools in 1924 numbered 295 with 1142 teachers and 38,648 pupils. Shipping is the chief industry, manufacturing being engaged in largely for local consumption. No later figures on commerce are available than those published in the preceding YEAR BOOK. Before the war the principal exports from Danzig were grain, lumber, and sugar; since the war lumber and sugar are assuming their pre-war importance but grain is imported instead of being exported. It is expected this situation will reverse itself when Soviet Russia reaches its maximum grain production again. The budget for 1924 balanced at 815,984,300 gulden; and for 1925 at 114,900,000 gulden. In 1923 2930 vessels of 1,722,927 tons entered and 3856 vessels of 1,689,255 tons cleared.

The government of the free city is in the hands of a High Commissioner appointed by the League of Nations. Its constitution, approved by the League of Nations May 11, 1922, provides for a legislative assembly of 120 members elected for four years, a senate consisting of 20 members, and a president and a vice-president. The senate is the highest authority in the state and holds secret sessions. Elections for the National Assembly held Nov. 18, 1923, returned members who were distributed

among the political parties as follows: German National People's Party, 33; Social Democrats, 29; Centre Party, 16; Communists, 11; German Democratic party, 8; Poles, 5; other parties, 16. High Commissioner at the beginning of 1925 (appointed Feb. 22, 1923), M. S. MacDonnell.

**DARTMOUTH COLLEGE.** A non-sectarian institution of higher education at Hanover, N. H.; founded in 1769. The 1925 fall session had an enrollment of 2142 students, most of whom were working for the regular college degree, the exceptions being: eight graduate students; 35 in the medical school; 12 in the Thayer school; 85 in the Tuck school; and 1 unclassified student. There were 175 members of the faculty. At the 1925 fall meeting the Board of Trustees authorized the construction of a new library building. A new varsity field house was planned as the gift of Howard Clark Davis. The productive funds amounted to \$7,500,000. The library contained 213,000 volumes. President, Ernest Martin Hopkins.

**DARWIN, SIR FRANCIS.** British botanist and author, died at Cambridge, September 19. The third son of Charles and Emma Darwin, he was born Aug. 16, 1848. After studying at the Clapham Grammar School, he entered Trinity College, Cambridge. Later medical study at St. George's Hospital gained him the degree of M.B., but he never practiced. He also served an apprenticeship in the laboratory of Professor Sachs in the University of Wurzburg. For eight years he was assistant secretary to his father, till the latter's death. He was then elected a fellow of Christ's College, and later became an honorary fellow. He served the Royal Society as foreign secretary 1903-07, and vice-president, 1907-08. In 1912 he was awarded the Darwin medal. He was university lecturer at Cambridge 1884-88 and from 1888 to 1904 he was the university reader. He conducted teaching and research in plant physiology. He wrote for his course *Elements of Botany* (1895), notable for attractive style and freshness of treatment; later in 1904 in collaboration with E. H. Acton, he wrote *Practical Physiology of Plants*. In 1904 he resigned the readership at the University, but continued his own investigations in the University laboratory, and in 1908 he transferred his father's scientific library to the Botanical Department expressing his intention of bequeathing it to the University. In 1908 Francis Darwin was president of the British Association at its Dublin meeting. Among his most important works are the *Life and Letters of Charles Darwin* (1887); *More Letters of Charles Darwin* (1903); *Diversions of a Scientist* (1917); and *Stray Papers of a Scientist* (1920). Charles Darwin wrote in conjunction with him *Power of Movement in Plants*. In 1913 Francis Darwin was created a knight. He was honorary Doctor of Science of Dublin, Liverpool, Sheffield, and Brussels, honorary LL.D. of St. Andrews, and honorary Ph.D. of Upsala and Prague.

**DAS, CHITTA RANJAM.** Indian political leader and first Mayor of Calcutta, died at Darjeeling, June 16. He was born at Calcutta, Nov. 5, 1870, of a high cast (Baidya) family and after graduating at the University of Calcutta came to England and was called to the bar. Practicing law at Calcutta he had little interest in

politics until 1919 when he joined the non-coöperating Nationalists and soon became the political leader of young Bengal. In 1921 he was elected president of the Indian National Congress at Ahmedabad, although he had a few days previously been arrested for issuing a public appeal for volunteers. His followers were in daily conflict with the police of Calcutta and Das himself was sent to prison for six months. The political theories of Das were often thought socialistic. He believed in autonomous village centres not as disconnected units, but held together by a scheme of coöperation and integration, with the central power merely advisory. He was the leader of the Swarajists and as such one of the most powerful politicians in the Empire. His funeral on June 18, was one of the most impressive ever known in Calcutta.

**DAWES PLAN.** Seymour Parker Gilbert, agent-general for reparation payments, in a report to the Reparation Commission, dated November 30, related the working of the Dawes Plan in its first year of operation. His report was regarded as indicating that the plan had achieved during the period covered as large a measure of success as had been expected of it for the time involved. According to his report, the plan had produced an important benefit in correcting German monetary and economic weakness by the restoration of currency and the establishment of a budgetary balance in the Reich, and had furnished a practical means for Germany to recover prosperity and at the same time to discharge reparation obligations. The report denied the presence of a commercial crisis in Germany, noting progress in the treatment of credit troubles but found in the traffic barriers maintained against German exportation by a large number of countries the chief hindrance to German economic progress. It was pointed out that the initial annuity of a billion gold marks having been paid in full, the second annuity year would involve a direct charge on the German budget of 5,000,000 gold marks.

The interest on the bonds of the newly created National Railway Company was being met monthly and 50,000,000 marks had been paid to the account of the agent-general in October and November. The German government was likewise paying 20,000,000 marks a month out of its budgetary funds. The first annuity had been distributed, the chief recipient being France, which obtained 454,000,000 marks, of which 136,000,000, or about 30 per cent, went to cover Rhine army costs. The United States received 15,328,000 gold marks, which at the time of writing the report remained in Germany to the United States' credit. The German railways made, in the 11 months ending August 31, an estimated profit of 765,000,000 gold marks and of this 200,000,000 gold marks was paid to the agent-general as interest on bonds put up under the reparation plan. In addition, the railway company set aside more than 200,000,000 gold marks in order to help it meet this obligation at future periods. As to the marketing of German railway bonds to the value of 11,000,000,000 marks, issued to the Dawes plan trusteeship, Mr. Gilbert's report affirmed that it was still too early to make definite plans. The German budget, according to the report, was satisfactory from the point of view of reparations, and

showed an excess of actual revenues over budget estimates during the year 1924-25. The reichsmark circulation was reported at 5,083,000,000 and the gold reserve back of this circulation and the gold equivalent in foreign notes, was stated to be 1,555,000,000 gold marks and to have increased steadily since the outset of the system. See GERMANY.

**DAY, DAVID T.** Mining engineer and geologist, former head of the United States Geological Survey, died April 15, in Washington. Born at East Rockport, O., in 1859, Dr. Day was educated at the Johns Hopkins University graduating in 1881 and receiving his doctor's degree in 1884. After two years as instructor in chemistry at the University of Maryland, he became connected with the United States Geological Survey in 1886 and served as chief of the Division of Mining and Mineral Resources from 1886 to 1914, when he became connected with the Bureau of Mines as consulting chemist. Dr. Day was prominently identified with important petroleum investigations and was director in charge of petroleum exhibits at several world expositions. He was the author of *Handbook of the Petroleum Industry*, two volumes (1922), and for many years compiled *Mineral Resources of the United States* for the United States Geological Survey.

**DAY, MRS. SELDEN ALLEN.** See GARDENER MRS. HELEN HAMILTON.

**DAYTON, TENN.** See SCOPES TRIAL.

**DEATH RATE.** See VITAL STATISTICS.

**DECLARATION OF INDEPENDENCE, SESQUICENTENNIAL CELEBRATION OF.** See EXPOSITIONS.

**DECORATIVE ARTS AND MODERN INDUSTRIES, INTERNATIONAL EXPOSITION OF.** See EXPOSITIONS.

**DEFENSE DAY.** See PEACE.

**DELAWARE. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 223,003. The estimated population on July 1, 1925, was 234,720. The capital is Dover.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	140,000	3,780,000	\$4,234,000
	1925	145,000	5,365,000	8,487,000
Wheat	1924	100,000	1,780,000	2,563,000
	1925	103,000	1,906,000	2,764,000
Hay	1924	86,000	129,000 *	2,188,000
	1925	83,000	114,000 *	2,264,000
Sweet potatoes	1924	10,000	1,300,000	1,638,000
	1925	11,000	1,210,000	2,299,000

\* tons.

**MINERAL PRODUCTION.** Delaware is not important as a producer of minerals. The chief products are clay products, stone, sand, and gravel. The value of the clay products in 1923 was \$249,804, compared with \$219,633 in 1922. The total value of the mineral products of the State in 1923 was \$416,074, compared with a value of \$428,314 in 1922.

**FINANCE.** According to the summary of the United States Department of Commerce, payments for maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1924, amounted to \$3,763,890. The expenditures for interest on debt and for per-

manent improvements brought the total to \$7,876,413. The per capita expenditure for maintenance and operation in 1924 was \$16.18. The largest single expenditure was \$3,771,940 for the maintenance and construction of highways. The total revenue receipts of the State for 1924 amounted to \$8,023,625, which was \$3,948,840 more than the total payments, excluding those for permanent improvements, and \$147,212 more than the total payments. Of the total revenue, property and special taxes represented 47.2 per cent. These amounted, per capita, in 1924, to \$16.29, compared with \$13.87 in 1923 and \$2.11 in 1917. Aside from property and special taxes, the revenue was derived from earnings of the general departments and from business and non-business licenses. The total net indebtedness of the State in 1924 was \$6,607,098, or \$28.41 per capita, compared with \$28.79 in 1923 and \$4.02 in 1917. The assessed valuation of property in 1923 was \$235,368,006. The State taxes levied amounted to \$588,420, or \$2.53 per capita.

**TRANSPORTATION.** The total mileage of steam railroads in 1925 was 708.5, of which 278.4 was first track. There was no new construction during 1925.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$128,951,000 in 1923, compared with \$86,756,000 in 1921, and \$165,073,009 in 1919. The average number of wage earners employed during 1923 was 23,188, 17,754 in 1921, and 32,972 in 1919. The tanning, currying, and finishing of leather is the leading industry in the State, measured either by the number of wage earners or by the value of products. This industry employed, during 1923, 2261 wage earners, and in 1921, 1691. The number of establishments whose output was \$5000 or more, decreased from 460 in 1921 to 453 in 1923.

**EDUCATION.** The most notable result of educational efforts during the year was the increase of the average number of days attended by all pupils of the State from 147.3 days in 1923-24 to 155.9 in 1924-25.

**CHARITIES AND CORRECTIONS.** The State Health and Welfare Commission was created in 1923 and has general supervision of the charitable and correctional institutions of the State, which include a Home for the Feeble-minded, Industrial Schools for White and Colored Girls, the Ferris Industrial School of Delaware, and other institutions. The Legislature of 1925 passed no important measures relating to charities and corrections.

**LEGISLATION.** The salary of the governor was raised from \$4000 to \$7500, and an additional sum of \$2500 a year was authorized for an expense fund. "Our Delaware" was authorized as the State song. The chief justice and associate judges of the State were authorized to make rules to regulate procedure in civil actions. Embezzlements were made felonies instead of misdemeanors and were punishable by lashes and imprisonment. A measure was enacted providing that recoveries for civil injuries committed by married women are against them alone, and that husbands shall not be responsible, except in cases where they would be responsible if the marriage did not exist. The State Highway Commission was given control of all State highways outside of incorporated cities and towns,

in this way securing a unified police regulation.

**POLITICAL AND OTHER EVENTS.** There were no unusual political developments in the State during 1925. William D. Denny, elected in November, 1924, was inaugurated in January, 1925. The legislature was in session during the year, and in March passed a measure imposing \$25 for a first offense; the revocation of license for a second offense, upon any school teacher who fails to recite five verses of the Bible and have the children repeat the Lord's Prayer, at the opening of school each day. Another attempt was made to abolish the whipping post in the State. Delaware is the only State in which the custom of whipping criminals exists. It is used especially in the case of wife beaters, but the penalty is applied also to other crimes. The punishment consists of from 20 to 60 lashes, varying with the crime, and is administered in some cases by the sheriff and in others by officials delegated to that duty. A bill abolishing this punishment was defeated by an almost unanimous vote in the legislature.

**OFFICERS.** Governor, R. P. Robinson; Lieutenant-Governor, J. H. Anderson; Secretary of State, A. R. Benson; Treasurer, Thomas S. Four-acre; Auditor, J. M. Harrington; Attorney-General, C. A. Southerland; Commissioner of Insurance, Dr. Horace M. Hollis; State Bank Commissioner, Harold W. Horsey.

**JUDICIARY:** Chancellor, Josiah O. Wolcott; Chief Justice, James Pennewill; Associate Judges, Richard S. Rodney (at large), Herbert L. Rice, William Watson Harrington, and Charles S. Richards.

**DELAWARE RIVER, BRIDGE.** See BRIDGES.

**DE MOLAY, ORDER OF.** A non-sectarian secret organization for boys between the ages of 16 and 21, founded Mar. 24, 1919, by Frank S. Land in Kansas City, Mo. It is named in honor of Jacques De Molay, the last military Grand Master of the Knights Templar, leader against the Saracens for the recovery of the Holy Land, and put to death in 1314 by Philip the Fair, king of France, for refusal to betray his brother knights. There are chapters throughout the United States in Canada, Mexico, the Panama Canal Zone, Porto Rico, the Philippine Islands, Italy and France, also a chapter composed of sailors in the United States battle fleet. The members are pledged to promote the public school system, reverence women, honor their parents, and to observe certain obligatory days. The two degrees of the Order are the initiatory and the De Molay, depicting the life of De Molay as an inspiration to the candidate for adherence to principles. A Grand Council of Freemasons is the governing body of the Order, and the annual meeting convenes at Kansas City in even-numbered years, and alternate years in other cities. In 1925 the Order took special interest in outdoor sports, and planned national athletic activities for 1926. There are regional camps at Manistee, Mich., Brinkhaven, O., Spirit Lake, Ia., and Hollister, Mo., and the national camp at Bear Lake, Col. In November, 1925, there were 1500 chapters, a membership of 200,000, and about 90,000 De Molays outgrown active membership. Frank S. Land is Grand Scribe of the Order, with headquarters at 1201 Federal Reserve Bank Building, Kansas City, Mo.

**DENISON, GEORGE TAYLOR.** Canadian imperialist, died at Toronto, Canada, June 6. He

was born in Toronto, Aug. 31, 1839, his father being the founder of the Canadian Militia. He was educated at the Upper Canada College and Toronto University, where he gained the degree of LL.D., and was called to the Ontario Bar in 1861. He served 44 years in the Canadian Militia, entering the Governor-General's Body Guard in 1855 as a cornet and eventually becoming honorary colonel. He saw active military service under Sir Garnet Wolseley during the Fenian raid on Fort Erie in 1866, and in the Northwest or Riel Rebellion in 1885. His chief aim was to urge loyalty to the Empire and a close connection between Great Britain and Canada. He opposed Prof. Goldwin Smith when that scholar advocated a political union between Canada and the United States, and he was an active supporter of Sir John Macdonald and the Conservative Party in the general election of 1891. Colonel Denison supported the Liberal Prime Minister, Sir Wilfrid Laurier, when he established a tariff preference in favor of British imports. This support was withdrawn when the Laurier Government in 1911 made the Trade Agreement with Washington. He was a great believer in Imperial defense and was the founder in 1896 and for many years President of the British Empire League in Canada. He was previously President of the Imperial Federation League in Canada, 1893-5. Colonel Denison from 1877 to 1922 was a Police Magistrate of Toronto and had been President of the Royal Society of Canada. He wrote several books, including: *Manual of Outpost Duties* (1866); *The Fenian Raid on Fort Erie* (1866); *Modern Cavalry*, (1868); *History of Cavalry* (1877); *Soldiering in Canada* (1900); *The Struggle for Imperial Unity* (1909); and *Recollections of a Police Magistrate* (1920).

**DENMARK.** The smallest of the three Scandinavian states; comprising the peninsula of Jutland with its adjacent islands in the Baltic, the Færoe Islands, and also by the plebiscite of 1920 under the terms of the Peace Treaty, a part of Schleswig. Greenland (q.v.) is the only colony or possession. Iceland is a free sovereign state, but united to Denmark in the person of the King of Denmark who is also head of the government of Iceland (q.v.). Capital, Copenhagen.

**AREA AND POPULATION.** Area 16,604 square miles, excluding the Færoe Islands, which have an area of 540 square miles; population, according to the census of 1921, 3,267,831. North Schleswig, which voted in the plebiscite of 1920 to form a part of Denmark, had an area of 1538 square miles and 163,622 inhabitants in 1921. The islands in the Baltic have an area of 5133 square miles, with a population in 1921 of 1,208,008. Of the population of Denmark proper in 1921, 96.57 per cent were born in Denmark and only 0.88 per cent in other countries than Scandinavia and Germany (1.18 per cent). The movement of population in 1923 was: Births, 74,818; deaths, 37,890; marriages, 26,858. Emigrants, chiefly to the United States, amounted to 7601 in 1923. Population of Copenhagen in 1921 was 561,344, and with suburbs, 700,610. Other large cities with populations are: Aarhus, 74,256; Odense, 49,469; and Aalborg, 41,613.

**EDUCATION.** Elementary education is free and compulsory between the ages of 7 and 14. In 1923 there were 4499 lower schools, of which 34 were maintained by the government, 3828

by the local communities, and 637 by private agencies. The total number of pupils for the public schools was 503,353. For higher education there is the University of Copenhagen with about 120 professors and teachers and about 4000 students. There are also many popular high schools, agricultural schools, training schools for teachers, and other technical and special institutions.

**PRODUCTION.** Denmark is preëminently a farming country. With one-third of the population engaged directly in agricultural pursuits, Denmark necessarily depends for its prosperity on the development of its agricultural export trade. The area of the country is comparatively small, but as the land is exceptionally fertile and has a configuration that makes it easily tillable, about 80 per cent of the total area is under cultivation. Dairying, hog raising, and poultry farming have been developed into highly specialized branches. Being practically destitute of natural resources other than agricultural, the country must import large quantities of raw materials. These are needed not only to maintain the extensive production of farm, dairying, and packing-house products, but also to meet the requirements of the many minor industries that have developed in such lines as paper, machinery, shipbuilding, electrical equipment, matches, textiles, and oil extraction. The accompanying table from the *Statesman's Year Book* for 1925 shows the crops, acreage, and production for 1923:

Crops	Area	Production
	1923. Acres	1923 Tons
Wheat .....	204,930	241,068
Rye .....	574,465	384,713
Barley .....	689,684	708,678
Oats .....	1,121,579	915,968
Mixed grain .....	510,889	448,087
Potatoes .....	204,060	1,288,208

On July 15, 1924, there were in Denmark 548,000 horses, 2,667,000 head of cattle, 302,000 sheep, 2,868,000 swine, and 20,284,000 hens. The total value of the fish caught in 1923 was £1,879,202, which was almost £400,000 greater than in the preceding year. See also Table of Production by Countries under article AGRICULTURE.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce striking increases in volume and value of exports characterized the foreign trade of Denmark during 1924. The accompanying table shows the value of imports and exports in 1923 and 1924 in Danish crowns with their equivalent in dollars:

Item	Value	
	1923	1924
Imports		
1923 .....	2,080,975,000	\$371,688,000
1924 .....	2,360,675,000	\$394,233,000
Exports		
1923 .....	1,693,974,000	\$309,997,000
1924 .....	2,151,701,000	\$359,334,000

The rate of conversion in 1923 was 18.3 cents and, in 1924, 16.7 cents.

The principal factors in Danish export trade are agriculture and dairying, which experienced a banner year in 1924 with greatly increased volume of shipments and considerably higher prices. The slight depreciation in Danish currency likewise was a contributing element in the expansion of the country's export trade. Its industries were prosperous and their exports very satisfactory, particularly in the cement, shipbuilding, electrical, and oil-extracting lines. On account of its location and excellent harbor facilities Denmark is in a position to conduct a large entrepôt trade. The re-exports during 1924 reached a total value of 178,187,000 crowns, or 8 per cent of the total imports. This represents a considerable increase over 1923, for which year the exports of foreign merchandise totaled 146,000,000 crowns, or about 7 per cent of the total imports. A clear conception of the importance of Danish exports of agricultural produce can be obtained from the accompanying tabulation of Danish exports during the years 1913, 1923, and 1924, and the percentages contributed thereto by farm produce:

#### VALUE OF AGRICULTURAL PRODUCE EXPORTED FROM DENMARK

[In Danish crowns; average exchange value in cents, 1913=26.8; 1923=18.36; 1924=16.72]

Commodity	1913	1923	1924
Butter, cheese, and condensed milk .....	228,109,000	513,414,000	677,565,000
Pork, meats, and packing-house products .....	184,651,000	484,407,000	531,905,000
Eggs .....	32,963,000	126,576,000	150,865,000
Livestock of all kinds .....	68,726,000	88,895,000	138,674,000
Grains .....	11,522,000	6,238,000	24,806,000
Feedstuffs .....	3,481,000	3,785,000	12,698,000
Total .....	524,452,000	1,223,265,000	1,536,513,000
Share in grand total of exports .....	Per cent 82.3	Per cent 79.8	Per cent 77.3

**FINANCE.** The following table taken from the *Statesman's Year Book* for 1925 is an abstract of the budget estimates for the fiscal year 1925-26:

Current revenue	Kroner
Balance of domain revenues .....	699,708
Balance of State undertaking .....	22,633,589
Interest (net) .....	1,545,981
Balance of funds, etc. ....	618,670
Direct and indirect taxes .....	387,041,202
Balance of lotteries .....	2,525,082
Separate revenues .....	3,337,943
Total current revenue .....	368,643,619
Current expenditure	Kroner
Civil list and appanages .....	1,222,000
Rigsdag .....	2,600,000
Council of State .....	501,821
Ministry of Foreign Affairs .....	6,664,236
Ministry of Ecclesiastical Affairs .....	4,040,123
Ministry of Public Instruction .....	66,803,764
Ministry of Justice .....	18,808,016
Ministry of Interior .....	65,818,958
Ministry of Labour .....	64,034,407
Ministry of Agriculture .....	12,069,962
Ministry of War .....	40,943,688
Ministry of Marine .....	24,727,172
Ministry of Finance .....	25,165,074
Ministry of Public Works .....	8,472,611
Ministry of Industry, Commerce and Navigation .....	5,091,599
Greenland .....	48,695
Pensions .....	13,812,770
Total current expenditure .....	360,824,896

**COMMUNICATIONS.** In 1923, 31,959 vessels of 9,056,000 tons entered the Danish ports from foreign countries and 32,598 vessels of 9,070,000 tons cleared. The railways of Denmark aggre-

gate approximately 3100 miles, one-half of which, including all the main lines, were for through traffic between the parts of the country and abroad, and were owned and operated by the government. In the other lines the government has the greater or less interest through the ownership of part of the capital stock.

**GOVERNMENT.** Executive power is vested in the king who acts through a responsible ministry, but who has no power to declare war or conclude peace without the consent of the Rigsdag or parliament; and the legislative power is vested in the Rigsdag, which is composed of the Folketing (lower house), and the Landsting (upper house), the former having 149 members, of whom 117 are elected on the basis of proportional representation, and the latter having 75 members, elected indirectly by the voters for the lower house. King at the beginning of 1925, Christian X (born Sept. 26, 1870), who succeeded his father, Frederik VIII, on May 14, 1912. The ministry as formed on Apr. 23, 1924, was as follows: Premier and Minister of Industry, Commerce and Navigation, Th. Stauning; Foreign

Affairs, C. P. Moltke; Interior, C. N. Hauge; Justice, K. K. Steincke; Defense, L. D. Rasmussen; Education, Nina Bang; Ecclesiastical Affairs, N. P. Dahl; Agriculture, K. M. Bording; Public Works, J. Friis-Skotte; Finance, C. V. Bramenas; Labor, F. J. Borgbjerg.

**HISTORY.** During the first half of the year Danish industry was severely handicapped by the worst labor troubles in the history of the country. The disputes affected virtually every factory in the country, arising over the inability of the government arbitrators to find a wage scale satisfactory to both labor and capital. The government was in a highly delicate position inasmuch as all the members of the cabinet were Socialists and many of them leaders of unions. The employers finally resorted to the lockout in cases affecting more than 100,000 workmen. On May Day a small riot occurred in the capital between the Socialist paraders and a group of Communists who had attached themselves to the procession. As the latter had been continually repudiated by the former, they were set upon when they interrupted the Socialist speakers and tore down banners, emblems, etc., in the course of the demonstration. During May the strikes and lockouts spread and caused a complete tieup of Denmark's commercial and agricultural pursuits. Foreign trade unions were called upon for financial aid and sent large sums of money to their fellow workers in Denmark, thus, in a measure, aiding in prolonging the strikes. The strike finally ended on June 8 when the suggestions of the government arbitrators were accepted by both sides.

**DENVER, UNIVERSITY OF.** An institution of

higher education at Denver, Colo.; founded in 1864. The enrollment as of Oct. 1, 1925, was as follows: college of liberal arts 1038; pharmacy 55; engineering 121; commerce 636; law 99; dentistry 184; extension 370. In the summer session 852 students were enrolled, making a total of 3255. The faculty included 172 members. The productive funds of the institution were \$950,000 and the library contained in all departments 40,000 volumes. Chancellor, Heber Reece Harper.

**DEPAUW UNIVERSITY.** A coeducational institution of higher learning at Greencastle, Ind., under the auspices of the Methodist Episcopal Church; founded in 1837. The total enrollment for the first semester of 1925-26 was 1793 without duplications, and there were 181 registered in the 1925 summer session. There were 90 members on the teaching staff not including laboratory assistants, and 17 administrative officers. Professor Orrin H. Smith, Ph.D., formerly professor of physics in Cornell College, was made professor and head of the department of physics at DePauw. The productive endowment amounted to \$4,226,521.23, and the endowment earnings for the year to \$127,535.39. The library contained 40,825 volumes, and 6020 volumes of bound magazines, and 10,500 bound government documents making a total of 57,345 volumes. President, Lemuel Herbert Murlin, D.D., LL.D.

**DERBY.** See RACING.

**DE RESZKE, JEAN.** See RESZKE, JEAN DE.

**DESTROYER.** See VESSELS, NAVAL; NAVAL PROGRESS.

**DETROIT, UNIVERSITY OF.** An institution of higher education at Detroit, Mich., under the auspices of the Roman Catholic Church; founded in 1911. It is conducted by the Jesuit Fathers, whose services as well as those of a number of lay professors are gratis. The enrollment for the fall term of 1925 was 2385 students, of which 1835 were in the college and 550 in the high school. The faculty consisted of 123 professors and 75 instructors and lecturers, making a total of 198. The registration by departments was as follows: law, 216; engineering, 432; commerce and finance (both day and evening), 947; arts and sciences, 240; high school, 550. The productive funds amounted to \$427,455.77. The students' library contained about 45,000 volumes. During 1925 for the first time the extension course was offered in the College of Arts and Sciences and attracted 95 students. There was completed during the year an extension to Godfrey Hall, costing about \$12,000, while there were under construction on the new campus faculty and power buildings to cost \$540,000. President, Rev. John P. McNichols, S.J., A.M., Ph.D.

**DE YOUNG, MICHAEL HARRY.** American newspaper publisher, died February 15. He was born at St. Louis, Oct. 1, 1849, and when five years of age removed to California with his parents. With his brother Charles he established in 1865 the *Dramatic Chronicle*, which later, renamed the *San Francisco Chronicle*, became one of the leading papers on the Pacific Coast. At the death of his brother in 1880, Mr. H. De Young became sole proprietor and editor-in-chief. In 1889 he was Commissioner from California to the Paris Exposition and in 1892 he was an unsuccessful candidate for United States Senator. He was Vice-President of the World's Columbian National Commission from 1892 to 1893, and

was the leading spirit in the California Mid-winter Exposition of 1893-4. He was a delegate to the Republican National Conventions of 1888, 1892, and 1908 and eight years a member of the Republican National Committee, for four of which he was vice-chairman. He was President of the International League of Press Clubs and in 1882 a director of the Associated Press. He was Commissioner General from California to the Omaha Trans-Mississippi Exposition (1898), President of the United States Commission to the Paris Exposition (1900), a member of the Executive Committee of the Relief and Red Cross funds of California, and Vice-President of the Panama-Pacific International Exposition.

**DIABETES, di-à-bē-tēs.** Our knowledge of this affection and of its scientific management in no wise stops with the Allen diet and the use of insulin, for new problems constantly present themselves. The *Muenchener medizinische Wochenschrift* for October 2 contained the startling information that insulin checks the formation of sugar when merely injected in a minute quantity into the thickness of the skin, without reaching the circulation at all. This action is moreover entirely dissimilar to the behavior when insulin is injected into the veins or subcutaneously. Introduced into the circulation insulin simply destroys the blood sugar and may indeed overdo, for by destroying the fraction normally present, it seems to rouse the sugar-forming forces to over-action. When injected into the thickness of the skin the result is a reflex action on the liver which stimulates the transformation of blood sugar into glycogen. Insulin in the circulation does not affect the liver while injected into the skin there is no destruction of sugar in the blood. When injected subcutaneously both forms of behavior are represented but the action on the liver is at a minimum. Thus far no practical application seems to have been made of the discovery of the results of intradermic injection, the new discovery will have to be tested extensively in the clinic.

Previously Dr. Hugo Weiss of Vienna had announced that he had obtained results with a double citrate of lithium and sodium given by the stomach which were in every way equal to those obtained by insulin. The use of alkalies in diabetes is very ancient and is justified by Weiss because of the tendency in diabetes toward acid intoxication. As far as known this substance had not come into general use and no general corroboration of Weiss's claims was available.

In the *Journal of the American Medical Association* for July 4 Dr. Epstein of Mt. Sinai Hospital, New York, attempts to explain the mechanism of diabetes. His laboratory research suggests that during the inflammation of the pancreas which is responsible for true diabetes, the enzyme trypsin and the hormone insulin find their way into the blood. Insulin thus present is inactive and as yet it was impossible to connect this behavior with the development of diabetes; but the escape of trypsin into the circulation is known to be followed by increase of the blood sugar and this may result because the trypsin antagonizes the action of insulin in destroying the blood sugar.

**DIAMONDS.** In 1925 the largest producers in South Africa restricted their output according to the allotted quotas, and the De Beers, the

Premier, Jagersfontein, and The Consolidated Diamond Mines of Southwest Africa were not making the maximum production. For the first nine months of 1925 the production of diamonds in the Union of South Africa was stated at 1,801,527 metric carats, valued at £6,037,965, as compared with 2,443,347 metric carats, valued at £8,020,466, for the full year of 1924. The diamond industry in South Africa recognized the fact that diamonds were being secured in Angola and the Congo and in other countries, such as British Guiana, and some doubt was manifested as to whether the South African producers, working in coöperation with the Diamond Syndicate would be able to control prices as they had in the past.

In the Belgian Congo in 1925 four principal diamond mining companies were operating, namely the mother company, Société Internationale Forestière et Minière du Congo (or Forminière), the Beceka, the Kasai, and the Luebo companies, together with the sister company Diamang, which was operating in nearby Angola. In 1924 these companies produced 666,290 carats of diamonds, or about 17.2 per cent of the world's supply and in 1925 a considerably larger production was estimated, the Forminière being expected to produce about 23,600 carats, the Beceka in excess of its 1924 production of 280,000 carats, the Kasai about 58,000 carats, the Luebo company approximately 23,000 carats, and the Diamang Company about 125,000 carats. New localities were being developed and prospected during the year. In 1925 the United States imports of diamonds, rough, for the year amounted to 171,842 carats as compared with 213,406 carats in 1924. Diamonds cut, unset, in 1925 totaled 513,783 carats as compared with 502,144 carats in 1924.

**DILLINGHAM, ALBERT CALDWELL.** United States naval officer, died at Norfolk, Va., December 6. He was born in Philadelphia, June 3, 1848, and after serving in the 7th Pa. Infantry during the Civil War graduated from the U. S. Naval Academy in 1869. He rose through the successive grades to rear-admiral, being commissioned in this rank Dec. 10, 1910. He was promoted for "gallant and conspicuous conduct" in battle during the war with Spain, and during the disturbance in Santo Domingo in 1904 he had charge of American interests, stopping a revolution and establishing a definite government. He subsequently coöperated with the United States minister in efforts to secure peace, and in placing the customs of the republic under the control of the United States. He retired June 3, 1910. In 1917 he was recalled to take charge of the development of the Naval Operating Base at Hampton Roads, Va., a service for which he received the Navy Cross with citation.

**DIPHTHERIA.** Dr. Lee K. Frankel, second vice-president of the Metropolitan Life Insurance Company, at one of the sessions of the New York Tuberculosis and Health Association in November expressed the belief that diphtheria in cities might be stamped out by 1930. We know its causation and mode of spreading; we know how to recognize, prevent and cure it. In the Bellevue-Yorkville section of New York City the officers of this Company in association with the New York City Health Department made 40,000 domiciliary visits in order to persuade the people to coöperate in the campaign for immunization of children of the pre-school

age. During the first week or two consent cards from parents numbering from 1000 to 1200 pre-school children were placed on file with the Health Department. In this connection it should be emphasized that the great industrial insurance companies were doing an inconceivable amount of good along educational lines in combating the propaganda of pseudo-scientific cults and quackery of all kinds: since these institutions can have no possible aims beyond diminishing the amount of death and disability among the policy holders.

**DISASTERS.** See **EARTHQUAKES**; **RAILWAY ACCIDENTS, ETC.**

**DISCIPLES OF CHRIST.** A communion, known also as the Churches of Christ, and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the nineteenth century, under Barton W. Stone in Kentucky and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1925. In polity the churches are congregational.

There were five major agencies of this communion in 1925: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Promotion of Christian Unity; and the Missionary societies of the several States and of provinces of Canada. In an advisory way these agencies are related to an International Convention of Disciples of Christ, which meets annually in October. The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 425 DeBaliviere Avenue, St. Louis, Mo. Its Board of Managers of 120 is composed equally of men and women. The foreign missionary work in 1925 embraced the Belgian Congo, China, India, Jamaica, Japan, Mexico, Philippines, Porto Rico, Argentina, Paraguav. and Tibet.

During 1925 there were 4050 baptisms in foreign fields. The Society had 424 mission schools and 13,895 under instruction. The Church Erection fund in 1925 amounted to \$2,284,036.26. During the year there were additions in membership to the home mission churches totaling 2530. The Society maintained Bible chairs in four universities. Work was conducted among the French, highlanders, immigrants, Indians, Negroes, Orientals, Spanish-Americans, and Mexicans. The Department of Benevolence conducted six homes for children, six homes for the aged and one hospital. The Men and Millions Movement reported pledges paid amounting to \$111,443.13 during the year, bringing the total up to \$5,620,145.18. In 1925, 25 colleges coöperated with the Board of Education.

Statistics for 1925 showed, for the United States and Canada, 8830 churches, 1,450,681 church memberships, and 8801 Bible schools with an enrollment of 1,190,788. The figures represented substantial increases over the previous year. Statistics of Disciples for the world gave 9581 churches, 1,535,658 members, and 9719 Bible schools, with an enrollment of 1,263,167. In the United States there were 6814 preachers and in foreign countries 339 missionaries and

1496 native workers. Contributions reported in the United States and Canada for the fiscal year totaled \$5,093,218.30. The Disciples publish many periodicals, among others the following: *World Call*; *Christian Evangelist*; *Christian Courier*; *Christian Unity Quarterly*.

The International Convention of Disciples of Christ meets annually. The president of the Convention for 1925-26 was A. D. Harmon, Lexington, Ky.

**DISEASES OF ANIMALS.** See VETERINARY MEDICINE.

**DISEASES OF PLANTS.** See BOTANY.

**DIVORCE.** See MARRIAGE AND DIVORCE.

**DOCKS.** See PORTS AND HARBORS.

**DOMINICA.** See LEEWARD ISLANDS.

**DOMINICAN REPUBLIC (SANTO DOMINGO).** A West Indian state occupying the eastern part of the island of Haiti or Santo Domingo, the larger part being occupied by the Republic of Haiti. Capital, Santo Domingo.

**AREA AND POPULATION.** The estimated area is 19,332 square miles; population at the census of 1921, 897,405. The larger cities with their populations at that census are: Santo Domingo, 30,957; Santiago de Los Caballeros, 17,052; San Pedro de Macoris, 13,802; La Vega, 6564.

**EDUCATION.** Primary instruction is free and compulsory, and maintained by the communes with state aid. The public schools are primary, secondary, technical, and normal schools. In 1920 the public schools numbered 972 with 1544 teachers and 105,000 pupils.

**PRODUCTION.** The chief source of wealth is agriculture, sugar cultivation being the chief industry. About 12,500 square miles of the total area are cultivatable and about 3,000,000 acres are suitable for grazing. In the north central and eastern portions, tobacco, cacao, and coffee are grown, while the largest sugar plantations are in the southern part. The forest area is 9,500,000 acres. In 1923 the production of sugar was 237,809 short tons; cacao, 19,830,722 kilos; tobacco, 16,000,000 pounds; coffee, 2,800,000 pounds. Minerals of almost every kind are found to some extent on the island.

**COMMERCE.** The total value of exports from the Dominican Republic in 1924 was \$30,272,896, according to figures issued by the office of the General Receiver of Customs. This represented a gain of some \$4,000,000 over the 1923 total of \$26,042,821. The imports for the same year reached a declared value of \$21,580,571, an increase of \$3,335,489 over the previous year, 1923. Exports of sugar rose from 169,510,902 kilos in 1923 valued at \$18,722,912, to 220,629,475 kilos in 1924 valued at \$21,682,558. Shipments of cacao increased in quantity from 19,830,722 kilos in 1923 to 23,142,498 kilos in 1924 but, on account of lower prices, brought a smaller return, the figures being \$2,917,165 and \$2,793,502 in 1923 and 1924, respectively. Exports of leaf tobacco advanced in value from \$1,913,661 in 1923 to \$2,279,314, but declined in quantity from 16,318,536 kilos to 15,760,205 kilos. Coffee exports increased from 1,397,878 kilos to 2,232,593 kilos and from \$427,588 to \$863,531 in value. The growing importance of corn as an export crop is apparent from these figures, showing that in 1924, 8,894,545 kilos, valued at \$341,539, were shipped from the Dominican Republic, whereas in 1923—a record year for this commodity—there were only 3,498,897 kilos, valued at \$161,680. Exports of these five principal

products totaled approximately 93.3 per cent of all the exports.

**FINANCE.** The receipts for the fiscal year 1925 were estimated at \$10,702,090.93, and the expenditures at \$10,689,313.22. The budget law distributed the expenditures in the following manner: Legislative power, \$223,220; Executive power, \$172,020; Interior, Police, War, and Navy, \$964,104; Foreign Affairs, \$284,593.41; Treasury and Commerce, \$640,694; Justice, \$678,887.88; Agriculture and Immigration, \$193,025; Public Works and Communications, \$881,458; Sanitation and Charities, \$97,920; Special expenditures, \$6,553,390.93. The special expenditures include the service on the foreign debt. The customs receipts for 1924 amounted to \$4,386,602.08 as compared with \$3,596,266.55 in 1923, showing an increase in favor of 1924 of \$790,335.53. The total public debt at the beginning of 1925 was \$13,433,900.

**COMMUNICATIONS.** In 1923, 799 vessels of 1,028,306 tons with cargo and 183 vessels of 2,572,479 tons in ballast entered the ports of the republic and 661 vessels of 886,201 tons with cargo and 218 vessels of 283,431 tons in ballast cleared. The total length of railway lines in 1919 was 153 miles exclusive of about 255 miles of private lines on the large estates.

**GOVERNMENT.** The republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924. Executive power is vested in a president and cabinet of seven ministers. The president is ineligible for a second successive term. The senators and deputies are elected for four years, by direct popular vote. Each of the 12 provinces is represented by one senator and two deputies in the legislature. President at the beginning of 1925, Horacio Vasquez, who was inaugurated on July 12, 1924.

**HISTORY.** During January the Senate of the United States ratified the treaties with the Dominican Republic which provided for the withdrawal of American troops from the island and the means by which the Dominican debt of \$25,000,000 was to be refunded. The President of the United States was to appoint a receiver of customs who was to collect all duties until the retirement or payment of all bonds necessitated by the refunding scheme.

**DONALDSON, SIR GEORGE.** British art dealer and collector, died March 19. He was born May 25, 1845, and received an excellent education, traveled in Southern Europe, and later engaged in business as a dealer in works of art. In addition to making a number of collections, he equipped a series of historic music rooms in the Inventions Exhibition of 1885, while a collection of musical instruments which he had spent many years in acquiring was given to the Royal College of Music forming the Donaldson Museum. He was Vice-President of the International Jury at the Paris Exhibitions of 1889 and 1900 and a member of the Royal Commission of the St. Louis Exhibition, 1904. He donated in 1900 a collection of furniture to the Victoria and Albert Museum. Donaldson was knighted in 1904 and elected a fellow at the Royal College of Music in 1923. He was a Director of the Royal Academy of Music.

**DOREMUS, CHARLES AVERY.** American chemist, died December 2. He was born in New York City, the son of Prof. R. Ogden Doremus, and graduated at the College of the City of New York in 1870. He took his Ph.D. at

Heidelberg, and joined the teaching staff of Bellevue Hospital Medical College in 1874. In 1879 he was appointed professor at the University of Buffalo, serving until 1882 when he became professor in the American Veterinary College of New York City. He taught chemistry and physics at the College of the City of New York for 22 years. He developed various chemical processes and was the author of numerous articles in scientific journals.

**DOURINE.** See **VETERINARY MEDICINE.**

**DOYLE, ROBERT MORRIS.** United States naval officer, died at Coconut Grove, Miami, Fla., December 15. He was born at Dyersburg, Tenn., May 5, 1853, and graduated from the United States Naval Academy in 1875, passing through the grades to rear admiral (June 7, 1913), being retired May 5, 1915. During the Spanish-American War he was navigating officer on the U. S. S. *Disie*, and later commanded the *Culgoa* and the *Chicago*. On the world cruise of the American battleships he commanded the *Missouri*. He was commandant of the Norfolk Navy Yard, 1911-13, and commander-in-chief of the Pacific Reserve Fleet, 1913-15. In 1918, recalled to active duty, he commanded the 14th Naval District and the United States Naval Station at Pearl Harbor, Hawaii.

**DRAINAGE.** See **RECLAMATION.**

**DRAKE UNIVERSITY.** An institution of the higher education at Des Moines, Iowa; founded in 1881. The number of students enrolled in the fall of 1925 was 1968; in the summer school, 616. The fall enrollment was distributed as follows: College of liberal arts, 610; commerce, 271; education, 413; law, 95; fine arts, 497; Bible, 82. The number of the faculty was 90. The fixed endowment amounted to \$488,492.49 and annuities \$351,055.37, making a total endowment of \$839,547.86. The number of volumes in the library was 45,000. President, Daniel W. Morehouse, Ph.D.

**DRAMA.** See **THEATRE** and articles on Literature, as **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE.**

**DUKE, JAMES BUCHANAN.** American manufacturer, philanthropist, and founder of Duke University, died October 10. He was born on a farm near Durham, N. C., in 1857, and was educated at country schools. At an early age he entered the tobacco business with his father and brothers at Durham, N. C. In 1884 he went to New York where he organized the American Tobacco Company in 1889, serving as president until 1912. Previously he had been president of the Continental Tobacco Company, and the Consolidated Tobacco Company, chairman of the board of directors of the British-American Tobacco Company, Ltd. He was director in the Union Bleaching & Finishing Company, and president of the Southern Power Company. In 1902 he gave to Trinity College, Durham, N. C., its library building. In 1922 he gave \$1,000,000 for the endowment fund, and \$25,000 for a memorial gymnasium. In 1924 he placed securities valued at \$40,000,000 in a trust fund to be administered by a board of trustees for educational and charitable purposes in the States of North and South Carolina. This trust provided for the establishment in North Carolina of an institution of learning to be known as

Duke University (q.v.). To conform with the gift conditions Trinity College was expanded into Duke University. His will further greatly increased the funds for Duke University.

**DUKE UNIVERSITY.** An institution for higher education at Durham, N. C.; established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke (q.v.). In December, 1924, Mr. Duke executed an indenture setting aside \$40,000,000 for educational and charitable purposes; \$6,000,000 of this fund was for the erection of buildings at Duke University, while 32 per cent of the income from the fund was to go to Duke University, beginning in January, 1926. Later he gave \$2,000,000 to be applied to the building fund and in his will added \$10,000,000, \$4,000,000 of which was for buildings for a medical school. An additional \$7,000,000 was given to the building fund, making a total building fund of \$19,000,000. In addition, under the will of the founder, Duke University was to receive 10 per cent of the residuary estate. For the new buildings 4000 acres of land were purchased adjoining the existing campus on which in 1925 eleven buildings were being erected. Another unit of 35 buildings was projected for later construction. In the autumn of 1925 the enrollment of students was 1358 and in the summer school 1146. The faculty numbered 78, including 12 additions to the staff made during the year. President, William Preston Few, Ph.D., LL.D.

**DUNKERS or DUNKARDS.** See **BRETHREN, CHURCH OF THE.**

**DUSTASTA, PAUL EUGENE.** French publicist and diplomat, died December 2. He was born Nov. 19, 1873, and after studying law he pursued further studies in the School of Oriental Languages and the School of Political Science where he received a diploma. He was appointed consul in 1898 and entered the ministry of foreign affairs in 1899. He was appointed secretary of the 3rd class (1900), being promoted to the 2nd class in 1904. He was secretary-general of the Tunisian Government in 1905, and in 1906 was chief of office and personnel. In 1907 he was made secretary of the 1st class, and in 1911 chargé of the consulate-general of Warsaw. He was minister plenipotentiary in the same year. In 1918 he was sent to Berne as ambassador and in 1919 served as secretary-general of the Peace Conference.

**DUTCH EAST INDIES.** A possession of the Netherlands in the East Indies, comprising the territory of Dutch East India and consisting of the group of islands in the Pacific lying between 6° N and 11° S, and between 95° and 141° E longitude. Capital, Batavia.

**AREA AND POPULATION.** The territory comprises: (1) Java and Madura, divided into 17 residencies, each under a resident and several assistants at the head of a large number of native officials; (2) the Outposts, consisting of Sumatra, Borneo, Celebes, a part of New Guinea, the Molucca Archipelago, the Sundra Islands and other small islands, under functionaries variously entitled governor, resident, controller, etc. The area is estimated at 733,642 square miles; population according to the population of 1920, 49,350,834. In the same year the Europeans numbered 169,708, and the Orientals, other than native, 876,506, mostly Chinese and Arab.

**PRODUCTION.** In the year 1923 the harvested acreage under various "native" crops in Java and Madura was apportioned as follows: Irrigated rice, 7,364,674; non-irrigated rice, 878,709; maize, 4,027,882; cassava, 1,837,104; potatoes, 435,165; groundnuts, 458,650; Soya beans, 409,594; other pulses, 483,400; tobacco (native), 302,964; other secondary crops, 1,553,112; total, 17,371,318. In the same year 404,078 acres were under sugar; the total production was 1,796,837 tons; and 180 factories were engaged in sugar manufacture. Other products were (1923): Coffee, 50,946 tons; rubber, 81,694,000 kilos; cinchona, 9,632,000 kilos; tobacco, 44,840,000 kilos; tea, 39,884,000 kilos; cacao, 934,000 kilos. Tin mines worked by government and private enterprise yielded 30,155 tons in 1923. The yield of the principal coal mines in Java, Sumatra, and Borneo in 1923 was 1,095,479 tons. Petroleum and other mineral oils in 1923 came to 2,832,758 thousands of kilos. Other minerals are gold, silver, diamonds, manganese, and copper. While the greater part of the soil of Java is claimed by the government, private estates are found chiefly in the western part, and mainly in the hands of Europeans and Chinese.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, the total foreign trade of the Dutch East Indies amounted to 2,271,347,000 florins, an increase of nearly 12 per cent over that of the previous year. (The value of the Java florin averaged about \$0.38 in 1924.) The export trade consisting almost entirely of agricultural products, accounted for 68.5 per cent of the total, while imports, comprised largely of textiles, rice, and supplies and equipment for the agricultural estates, represented 31.5 per cent. The total value of the export trade was 1,557,329,000 florins, an increase of 13 per cent over the total export for 1923. The gradual improvement that has recently been observable in the import trade was reflected in the increase of 9.25 per cent in imports over those of 1923. The 1924 figure, 714,018,000 florins, represented a gain of 60,379,000 florins. The values of exports and imports for both private and government accounts, showing the relative position of Java and the outer districts, are given in the accompanying table:

SUMMARY OF NETHERLANDS INDIAN  
FOREIGN TRADE  
[In units of 1,000 florins]

Items For private account	1923		1924	
	Exports	Imports	Exports	Imports
Java and Madura:				
Merchandise . . . . .	825,262	437,557	910,022	469,771
Specie . . . . .	1,951	5,532	1,056	3,118
Outer districts:				
Merchandise . . . . .	550,192	182,488	631,221	217,899
Specie . . . . .	2	595	46	366
Total . . . . .	1,377,407	626,172	1,542,345	691,154
For government account				
Java and Madura:				
Merchandise . . . . .	616	24,878	344	19,952
Specie . . . . .	190	.....	477	.....
Outer districts:				
Merchandise . . . . .	17	2,589	14,163	2,912
Total . . . . .	783	27,467	14,984	22,864
Grand total	1,378,149	653,639	1,557,329	714,018

**FINANCE.** The budget estimates for 1924 were: Revenue, 630,924,000 guilders; expenditures, 714,-

889,000; deficit, 83,965,000 guilders. For 1925 they were: Revenue, 648,879,000 guilders; expenditures, 688,999,000 guilders; deficit, 40,120,000 guilders. As the year 1925 drew to a close it was reported that instead of a deficit the current budget would probably show a surplus of more than 100,000,000 florins. The public debt amounted to 1,240,543,199 florins on Dec. 20, 1924,—a reduction of 53,933,475 florins from Dec. 31, 1923.

**COMMUNICATIONS.** Shipping entered in 1923 comprised 10,009 steamers with a tonnage of 6,444,699 and 7551 sailing vessels with a tonnage of 400,180. At the end of 1923 there were about 4335 miles of State and private railways, of which 3326 were in Java.

**GOVERNMENT.** The territory is under the sovereignty of the Netherlands (q.v.) but is partly under direct government and partly under subject native officials. The chief executive authority is the governor-general who is aided by a council of five members which acts partly as a legislative and partly as an advisory body. The governor-general and the council are nominated by the crown. Governor-General at the beginning of 1925, Dr. D. Fock.

**DUTCH GUIANA** (gē-ā'nā) or **SURINAM.** A Dutch possession on the north coast of South America lying between French Guiana on the east and British Guiana on the west, bounded on the south by unthinkable territory reaching to the Tumuc-Humac mountains. Area, 54,291 square miles; population, Dec. 31, 1923, 133,561, including Negroes and Indians. Capital, Paramaribo, with 44,772 inhabitants. The movement of population in 1923 was: Births, 3404; deaths, 2314; marriages, 395. Among the chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold production in 1922 amounted to 373,646 grams; the production of balata was 542,845 kilos. The foreign trade in 1924 showed a considerable decline in both imports and exports from 1923. The total imports in 1924 amounted to \$2,998,581, as compared with \$3,154,064 in 1923, and the exports were \$2,963,776 in 1924 as against \$3,355,355 in 1923. The principal articles of export were bauxite ore which showed a considerable gain in 1924, balata, cacao, gold, sugar, and timber. The imports included machinery, tools, paints and varnishes, rice, cheese, dried fruits, beef and packinghouse products, chemical products, dry goods, earthenware, fats, greases, and groceries. The executive authority rests with a governor and an assisting council, both nominated by the crown. Governor at the beginning of 1925, Baron van Heemstra.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH OF AMERICA.

**DUTCH WEST INDIES.** The name applied to the Dutch possessions in the West Indies, viz., Dutch Guiana (q.v.) and Curaçao (q.v.).

**DYESTUFFS.** See CHEMISTRY, INDUSTRIAL.

**DYNAMO-ELECTRIC MACHINERY.** As in 1924, the year was notable for the construction of many units of large capacity such as generators, motors, transformers, frequency-changers, etc. While no new types of machinery or apparatus were brought out, the machines constructed were notable for their size and rated capacity. One turbo-alternator of 62,500 kva. rating was put in regular service, as well as several of 60,000 kva., and 45,000 kva. Among the largest of these were two installed in France at

the Gennevilliers station near Paris, designed for an overload capacity of 65,000 kva. They were three-phase, alternating current machines, delivering energy at 6000 volts, 50 cycles per second. The largest aggregation of electric motors for railway service was embodied in the new three-unit electric locomotives put in operation on the Virginian Railway during the year and rated at 7125 horsepower. See RAILWAYS, ELECTRIC.

To keep pace with the increasing demands for energy by both public and private consumers, the large electric systems were obliged to build and put in service alternating current transformers of greater capacity than ever before. One of these was rated at 220 kv., 25,000 kva., single-phase current and was cooled by forced-oil circulation. Another, of 132 kv., 25,000 kva., was designed for three-phase current and arranged for self-cooling. Another large machine was a frequency-changer, designed to operate at 600 revolutions per minute and develop 11,500 volts, with a total capacity of 40,000 kva. In the iron and steel industries, many motors of large dimensions and heavy overload capacity were becoming increasingly common and in practically every branch of industrial activity, electric motors were displacing steam engines wherever economically possible.

**EARLING, ALBERT J.** American railway official died in Milwaukee, Wis., November 10. He was born at Richfield, Wis., Jan. 19, 1848, and after a common school education entered the service of the Milwaukee and St. Paul Railway in 1866, remaining with that organization, later the Chicago, Milwaukee and St. Paul, until he became president and later chairman of the board. For nine years he was telegraph operator and train dispatcher. After four more years, as assistant superintendent, in 1882, he became division superintendent. He was made assistant general superintendent in 1884, general superintendent in 1888 and in 1890 general manager. In 1895 he was second vice-president and on Sept. 23, 1899 he was made president of the company, leaving that position in September, 1917, to become chairman of the board of directors, and retiring at the end of 1918. Under him the St. Paul was one of the first roads to make extensive use of the manual block system on long stretches of single track, and he was one of the first to prepare for the St. Paul's extension to the Pacific coast.

**EARTH, AGE OF.** See GEOLOGY.

**EARTH, COMPOSITION OF.** See CHEMISTRY under *Mineralogical Chemistry*.

**EARTHQUAKES.** On June 29 a large part of Santa Barbara, Calif., was heavily damaged by an earthquake that caused a loss of twelve lives and a property loss of \$20,000,000. The quake was a strong local shock which happened to originate practically under the city; it was caused by movement on a fault that runs along the Santa Ynez range and passes through the Sheffield reservoir which held the city's reserve water supply. The area affected was small, hence the focus was probably shallow. Aftershocks continued to occur for some time. Much of the damage was due to poor building design and construction.

No precise forecasts of earthquakes, as regards exact time and place, are yet remotely possible; however, in a general way, the Santa Barbara quake was not unexpected. For a considerable

number of strong local shocks have occurred in southern California since 1915, indicating the existence of widespread regional strain; and it is known from geodetic surveys that a strong pressure from the south has caused the mountain ranges to move gradually, so that Gaviota Peak, e.g., has been pushed northward 24 feet in 30 years. Resulting movements on each of four great faults in the region during the past seven years have caused the San Jacinto, Inglewood, Elinore, and San Bernardino shocks; but meanwhile the fault system which outlines the San Gabriel range, extends west through the Santa Paula valley, and skirts the Santa Ynez range, had not shown any evidence of seismic activity since 1852, except for a local shock in 1902, until the present disturbance.

On February 28, nearly the whole eastern United States was rocked by a strong earthquake of unusually long duration. The epicentre was south of the Saguenay River in Quebec, and in this region considerable damage was done, especially to massive stone structures; fortunately, the area is thinly settled, and no lives were lost. Aftershocks continued to occur for some time in the epicentral tract.

Mild quakes were also felt in eastern New England on January 7; in southern New England on April 24; and in the upper Merrimac valley and at points in New Hampshire and Maine on October 9. A series of violent shocks occurred in Montana, beginning June 27. The Sierra Nevadas were shaken on March 30. Widespread shocks were felt in Indiana, Kentucky, Ohio, Illinois, and Missouri on April 26; and in Kansas, Oklahoma, Texas, and New Mexico on July 30. Little or no damage accompanied any of these disturbances.

On May 23, a violent quake in central Japan, with epicentre near the mouth of the Maruyama River, caused great destruction at Kumiham, Kinoshaki, and Toyooka; about 400 lives were lost. On March 19, Talifu in China was destroyed by earthquake and fire, 5000 being reported killed. See SEISMOLOGY.

**EAST AFRICA PROTECTORATE.** See KENYA COLONY.

**EBERT, FRIEDRICH.** First president of the German Republic, died at Charlottenburg, February 28. He was born in Heidelberg, Feb. 4, 1871, and after receiving an elementary education was apprenticed to a saddler at the age of 14 years. He traveled throughout Germany practicing his trade, and settled in Bremen. There he married and became a local organizer of the Socialist Party. Previously he had been one of the organizers of the Saddlers' Union. In 1894 he took charge of the Bremen *Bürgerzeitung*, a Socialist paper, and in 1900 he became secretary of the Bremen branch of the Socialist Party. He carried on a restaurant frequented by Socialists. As a member of the Executive Committee of the Social Democratic Party he became widely known and in 1912 he was elected to the Reichstag for the District of Elberfeld-Barmen. In the Reichstag he became influential. In 1913, following the deaths of Singer and Bebel, Ebert was elected president and held this position when the War broke out. He believed in ultimate victory for Germany and contributed his utmost to bring it about, opposing strikes during the War. In the case of the munitions strike of 1918 later evidence showed that he joined the strike committee with the object of bringing the movement

out of revolutionary channels. When Prince Max of Baden took over the government from Count Hertling he summoned Ebert to his Cabinet, but Ebert refused, putting forward Herr Scheidemann and others. After the armistice he cooperated with the revolutionaries so as to direct their activity into more constitutional channels. The minority Socialists and the "Spartacists" threatened extreme measures. He endeavored to suppress insurrection, and after the Republic had been proclaimed, with several of the moderates, he approached Prince Max and told him it was necessary to form a Socialist Government in order to prevent control by the extremists. At the request of Prince Max, Ebert formed a Council of the People's Commissioners consisting of three Majority Socialists and three Independent Socialists, and gathered volunteers to preserve order. After the Independents withdrew from this council Ebert filled their places with more conservative Socialists. He stated to an assembly of representatives of workmen and soldiers that he would not tolerate rule by force and that any future government must be founded along constitutional lines. His position was bitterly assailed, and a struggle for power occurred in January in which Noske stood behind Ebert. The force of opposition early was broken. Workmen's and Soldiers' Councils were subordinated to a more orderly procedure inaugurated by Ebert. A National Assembly, having met at Weimar, passed February 10 a law providing for a President of the Republic to be elected by the Assembly, on the basis of a new Constitution. Ebert was elected provisional President receiving 277 votes out of 379 cast. His term of office in the following August was extended until 1925. Ebert, while he acknowledged his Socialist connection, declared that he would act for the whole people and not for a party. This pledge he kept faithfully. He ruled Germany with a mixture of firmness and moderation during a period of difficulty and served his country with great devotion and judgment. His death evoked expressions of sorrow and sympathy not only in Germany, but throughout the entire world. He received an impressive official funeral, the oration being delivered at the Reichstag by Herr Luther, its President.

**ECLIPSES.** See **ASTRONOMY** under *Astronomical Phenomena*.

**ECONOMIC ENTOMOLOGY.** See **ENTOMOLOGY, ECONOMIC**.

**ECONOMICS.** See **LABOR; FINANCIAL REVIEW; INSURANCE; STRIKES AND LOCKOUTS;** and other articles on economic topics.

**ECUADOR**, ek'-wā-dōr. A South American republic on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

**AREA AND POPULATION.** The area in 1925 was undetermined on account of the boundary dispute with Peru, but was variously estimated at 116,000 to 276,000 square miles. The population had been recently estimated at about 2,000,000, about three-quarters of whom were Indians and the remainder of mixed blood. The chief towns with their populations are: Quito, 80,702; Guayaquil, 100,000; Cuenca, 30,000; Riobamba, 12,000. The movement of population in 1923 was: Births, 82,222; deaths, 46,149; marriages, 11,590.

**EDUCATION.** Primary education is free and compulsory. In 1922-23 there were 1488 schools,

1170 of which were government schools, 127 municipal, and 191 private. The total attendance was 101,378 and the number of teachers 1838. Institutions of higher learning include Central University at Quito, Guayas University at Guayaquil, and Azuay University at Cuenca, with a total attendance of 670 students; and a law college at Loja.

**PRODUCTION.** Cacao is the chief source of wealth of the country. The production in 1923 was 546,948 hundredweight, a considerable falling off from the 1922 production when it was 743,560 hundredweight. Other crops are coffee, rubber, ivory nuts, tobacco, and sugar. Ecuador has practically monopolized the manufacture of Panama hats, which are produced at the rate of about 700 dozen a month. The mineral resources include gold, silver, petroleum, copper, iron, lead, coal, and sulphur, but mining is almost exclusively confined to gold, of which practically the whole output is exported to the United States.

**COMMERCE.** Exports from Ecuador during 1924 were considerably larger in volume, but of average value. High prices were obtained for cacao, coffee, and ivory nuts, coffee showing the greatest increase in value of all exports. Other important exports were cyanide precipitates containing principally gold; cotton, fibre hats, rice, cotton textiles, and rubber. The United States took 25 per cent of the total exports in weight and over 35 per cent of the total in value. Germany, Spain, France, Netherlands, Great Britain, and Italy in the order named afforded the principal markets. In 1924 there was an increase in volume of exports absorbed by Germany and Spain while Italy was a purchaser of ivory nuts. The exports from Ecuador during 1924 and countries absorbing the various commodities are indicated in the accompanying table.

*Exports from Ecuador during 1924*

	Value Gold sucres *
Cacao .....	80,249,712
Coffee .....	9,816,890
Ivory nuts .....	8,544,486
Precipitates (cyanide—chiefly gold content) .....	2,683,977
Cotton .....	2,374,673
Hats (Ecuadorian straw and "Panama") .....	2,241,887
Rice .....	863,452
Textiles, cotton .....	572,262
Rubber .....	524,235
Hides .....	486,680
Kapok .....	483,555
Sugar .....	412,936
Miscellaneous items .....	2,518,694
<b>Total .....</b>	<b>61,267,919</b>

*Principal countries of destination*

	Value Gold sucres *
United States .....	18,993,423
Germany .....	7,921,179
Spain .....	6,221,867
France .....	5,765,847
Netherlands .....	5,462,475
United Kingdom .....	5,018,737
Italy .....	4,704,070
Latin American countries .....	5,358,472
All others .....	1,821,849
<b>Total .....</b>	<b>61,267,919</b>

\* The value of the gold sucre is \$0.4867.

**FINANCE.** The budget law for the fiscal year 1925 balanced at 35,833,080 sucres. Customs duties provide about 70 per cent of the revenue; taxes on cacao, real estate, white rum, and to-

bacco about 15 per cent; tax on salt about 6 per cent; and the remainder is derived from excise taxes, rents of State property, and the postal department. The foreign debt of Dec. 31, 1923, amounted to 38,275,487 sucres and the general debt to 36,032,920 sucres, making a total of 70,101,411 sucres.

**COMMUNICATIONS.** Steam vessels entered in 1923 at Guayaquil numbered 324 of 973,844 tons; cleared, 297 of 970,970 tons. The steamships of nine European lines visit Guayaquil by way of Magellan's Straits, and the port is also visited by steamers plying on the Pacific Coast. In 1923 the total length of railways in operation was 413 miles.

**GOVERNMENT.** Executive power is vested in a president, elected for four years, who acts through a cabinet of five ministers, and legislative power in a congress of two houses, a senate of 23 members, and a chamber of deputies of 48 members. President at the beginning of 1925, Gonzalo Cordova.

**HISTORY.** It was announced at the end of May that the government had purchased the Guayaquil and Quito Railroad, the only line in the republic. This road had never operated at a profit and it was confidently expected that the government would shortly raise the rates in order to increase the revenues. The road was purchased through the action of acting president Dr. Guerrero Martinez and when reported to President Cordova he issued a statement to the press disapproving the measure. The cabinet immediately resigned, but neither the president nor vice-president would accept the resignations at the time. Nevertheless the president announced the formation of a new cabinet on June 7, composed as follows: Interior, Señor Trujillo; Foreign Affairs, Dr. Camba Octavia Andrade; Public Instruction, Cabeza de Vaca; Finance, Vasconez Bueno; War, Soto Mayor.

On July 9 a military *coup d'état* succeeded in overthrowing the Cordova government, placing the president and all the members of his cabinet under a close guard. Dr. Cordova resigned from the presidency after the successful coup. The Minister to the United States resigned his position but offered to remain at Washington until relieved. The leaders in the revolution were General Gomez de la Torre, Luis Napoleon Dillon, and José Rafael Bustamante. The cabinet as selected on July 14 was made up as follows: Premier, M. L. Jijon; Foreign Affairs, J. R. Bustamante; Public Instruction, P. P. Garaicos; Labor, F. Bolona; Public Works, General Oliva; Finance, L. N. Dillon; War and Navy, General Torre. One of the first acts of the new government was to dispatch an emissary to the United States to attempt to gain recognition. The United States withheld recognition of the new government as *de jure* although doing business with it *de facto* in accordance with the adopted policy of waiting until the new government had been regularized before recognizing it. The people of Ecuador seemed to have complete confidence in the new government.

**EDINBURGH CONFERENCE OF THE WORLD FEDERATION OF EDUCATION ASSOCIATIONS.** See EDUCATION IN THE UNITED STATES.

**EDUCATION IN THE UNITED STATES. STATISTICS.** *Attendance.* The United States Bureau of Education presented the statistics for the various types of public and private schools for the school year 1921-22 as follows:

attendance in public and private kindergartens, 555,830; in public elementary schools, 2,366,218; in private elementary schools, 1,355,000. In public high schools there were 2,873,009; in private high schools, 225,873; in preparatory schools in connection with colleges and universities there were 67,649; and in secondary schools in connection with normal schools, 37,610. Including duplication of those reported in two different schools, there was a total of 23,925,359 students enrolled in kindergarten, elementary and secondary schools. Of each 100 students who entered the schools in 1911 less than 22 entered the high school in 1919, and less than 9 continued to the end of the high school course.

*Costs.* The total estimated cost of the public elementary schools, including kindergartens, was \$1,163,374.074 or a per capita cost of \$57.12. The estimated cost of the public high schools was \$417,297,222 or a per capita cost of \$145.25. Private elementary schools cost \$77,397,600 or a per capita cost of \$57.12; private high schools cost \$32,808,053 or a per capita cost of \$145.25.

The United States Bureau of Education gathered statistics from certain city school systems for the school year 1923-1924 and from these determined the per capita cost in these systems. The range is from \$132.30 per pupil in a city like Buffalo, New York, to \$35.74 in a city like Nashville, Tennessee. The average for the cities of 100,000 population or over was \$95.64. In the group of cities having a population of 30,000 to 100,000 the average was \$87.12, while among cities of 10,000 to 30,000 population the average was \$73.90.

*Value of School Property.* The States reported a total valuation of public elementary and secondary school property of \$3,800,563,063. It was estimated that the value of the school property used by private elementary schools is \$300,000,000; and private high schools and academies reported a value of \$265,361,403.

*Teachers.* The public elementary schools employed 593,439 teachers, of whom 520,947 were women and 72,492 were men. The public high schools employed 129,537 teachers, of whom 83,944 were women and 45,593 were men. Private elementary schools employed 47,410 teachers, of whom 40,858 were women and 6552 were men. Private high schools employed 14,237 teachers. Of these 8791 were men and 5446 were women. Public kindergartens employed 10,213 teachers, and private kindergartens 1629 teachers, all of whom were women.

**CURRICULUM.** The most important topic before educational circles during 1925 was the revision of curricula used in the elementary and secondary schools. There had been a very decided tendency to change the programmes of studies used in these institutions, not alone in the United States but in all civilized countries. Various students and other representatives of foreign countries have visited the United States in search of suggestions that might be adopted by their own countries in effecting changes. It had been some 35 years since the leaders in education in the United States were intensely concerned with modifying the subjects that are taught in the public schools. On this previous occasion there were two outstanding figures who determined in a large measure the recommendations that were received and adopted by the

committee organization concerned. Dr. Charles W. Eliot, at that time president of Harvard University, was the chairman of a committee which reported on the courses of study for the secondary schools. The report of this committee has shaped the work of the high schools from that time to this. In 1894 a committee headed by William T. Harris, at that time United States commissioner of education, rendered a report on changes required in the subject matter taught in the elementary school. This report was not as influential as that concerned with secondary education. It was, however, the only attempt to bring about a country-wide change in the elementary schools.

In 1925 various communities, as well as States, were undertaking revision of courses of study and the curricula used in their schools. There was, however, no pronounced leadership such as existed in the earlier attempt at change. Each community was endeavoring to put into operation its own interpretation of that which was most desirable, and in many respects there was a conspicuous lack of uniformity.

The extent to which lack of uniformity was likely to be a serious matter can be appreciated when it is remembered that the population in any of our communities is a shifting one. In the places where investigations had been conducted it had been found that comparatively few children remain in the same school, and therefore under the same requirements during the entire elementary school period. In some cases as many as two-thirds of the children had been in two or more different school systems. Coupled with these changes in residence was a pronounced tendency for children who had been in several different school systems to be seriously retarded in their school work. There was therefore the need for a more careful consideration of those features of elementary education which are common in the education of all children, but which are not so standardized as to appear at the same point in different courses of study.

Three major problems confront each community that undertakes a revision of its courses of study. The first of these relates to the way of administering the making of a new course of study: the second is concerned with the selection of subject matter that should be included in the work of the school; and the third deals with the ways in which the subject matter that is selected should be organized for presentation.

There was very great diversity as to the way in which a new curriculum should be developed. The following is typical of the differences: Los Angeles employed a director of the curriculum, whose duty it was to bring about such changes as are desirable. San Francisco freed some of the better teachers and other school officers from the regular work of the schools in order that they might give their full time and attention to curriculum revision. Berkeley, California, brought about the revision of the courses of study through committees of the teachers and other school officers headed and directed by the superintendent of schools. Denver, Colorado, had within two years appropriated approximately \$70,000 for the employment of specialists who came and directed the work of committees within the school system. Baltimore used the teaching force, organized into committees, to bring about a revision of its courses of study. Springfield, Massachu-

setts, was utilizing groups of its teachers for the revision of the courses of study. Other places in the East were using methods similar to those employed in Baltimore and Springfield.

The outstanding feature in all of these plans was the use of teachers and others who were in close touch with schoolroom practice. Until recently it was a general practice to have courses of study made by individuals or by small groups who in many cases were not in close touch with the work of the school. It was too early to predict the effectiveness of teachers in making changes in the curriculum. It was clear, however, that school administrators believed in the effectiveness of this plan.

The problem of what to include in the elementary school curriculum was far from a solution. Various answers had been submitted and there was an abundance of theory that had been expressed. Among the educators there was a group who advocated the selection of subject matter on the basis of its utility in adult life. Those who belonged to this group urged that studies be made of different adult activities in order to determine just what subject matter should be taught better to prepare persons to deal with the problems with which an adult meets. One of the most suggestive tendencies in this direction was found in spelling in the modern school. A few years ago spelling books often contained 25,000 words that the child was supposed to learn to spell during the elementary school period. A study of the words used in correspondence and in newspaper writing indicated that there were approximately 1000 words that were in frequent use, and that another 1000 or 1500 could be justified on the basis of their possible use, while a few other words were so characteristic of school work as to require attention. As a result of these investigations the modern spelling book contains such words as are known to be in common use, and thus limits the vocabulary that is taught to approximately 3000 words. There is now an attempt to determine the essential factors in arithmetic, geography, English and the other subjects in a manner similar to that employed in determining the vocabulary for spelling.

Another group of school people believed that the subject matter that should be used in school should be chosen in accordance with its fitness to achieve certain specified results. Those who believe in this method first determine the "objectives" of elementary education, and then provide the subject matter that will enable the child to achieve these objectives. Some of those who follow this plan have developed no less than 500 different objectives, and they have made an attempt to judge the subject matter that they incorporate in their courses of study in accordance with these objectives.

Another group believed that in addition to including those subjects that are used in adult life attention should also be given to such other subjects as people ought to use, and they believed that this latter group of subjects can be obtained by analyzing the writings of our best thinkers.

Still another group believed that in addition to teaching the habits and skills that are essential in school work the school should undertake the teaching of facts necessary for an understanding of complete subjects such as geography, history and arithmetic.

Each of these plans for the selection of subject matter was to be found in operation and each was treated in books and pamphlets, as well as in specific courses in teachers' colleges, and normal schools. Meanwhile there was a decided tendency for the legislatures of the different States to prescribe by statute what shall and shall not be taught. The most outstanding evidence of this tendency was found in the trial and conviction of John Thomas Scopes for teaching evolution in the schools of Tennessee contrary to the law. More recently the Texas State Text Book Board ordered that all reference to evolution in the books adopted for use in the schools be eliminated by the publishers before they are delivered.

The survey of State laws indicated that there were no less than 39 different subjects that are required in one or more of the States. These vary from such subjects as reading, arithmetic, geography and history, which are required in nearly all of the States, to such subjects as fire prevention, humane treatment of animals, accident prevention and elementary algebra that are required in comparatively few States.

Ideas concerning the plan of organization of subject matter that shall be taught in the elementary schools were no less varied than those that relate to the selection of subject matter. At least four different plans were in operation. One of these advocated that the subject matter should be organized about problems. Another advocated the organization of subject matter about projects or enterprises that the children may conduct. Another insisted upon the orderly, logical arrangement of the subject matter in connection with each of the subjects. The fourth scheme was to arrange the subject matter about activities that should be conducted in the school.

There was, therefore, great diversity of judgment as to the organization of subject matter. One feature, however, was receiving pronounced attention. There was such a variety of subjects required in the elementary school that teachers complained that they were unable to give any of the subjects suitable attention. The school day is broken up into short periods and parents complain that their children are obtaining a mere "smattering" of knowledge. This condition was driving school people to consider the ways and methods that might be employed in combining different subjects so as to provide for more adequate time and attention on the part of the teacher.

**ALL-YEAR SCHOOLS.** All-year schools had been in operation for a dozen years. Lack of school buildings and the large number of those who were required to repeat grades because of failures recently brought the problem of continuing and establishing all-year schools into pronounced prominence. Attention was centered on the all-year schools in Newark, New Jersey. They were first established in this city more than a decade previously. From time to time there were enthusiastic reports regarding the efficiency of these schools. But in 1923, however, the superintendent issued an unfavorable report of them. He declared that they were not doing as good work as the regular ten-months schools, and advocated that they should be abandoned. The Newark Board of Education accordingly passed a resolution terminating the schools on July 1, 1925. This action met with such

general dissatisfaction that the Board of Education refused to abolish the schools on July 1, and instead employed a group of specialists to make a careful study of the value of these schools in comparison with the regular ten-months school. The report of this committee was to appear early in 1926 and would be read with great interest by superintendents in various parts of the country.

Meanwhile, the Superintendent of Schools of Chicago recommended the establishment of all-year sessions for graded and high schools. He urged that "if such a plan were put into operation it would be possible for a student to complete courses in the graded and high schools in three years less time than is now required."

He recommended that the school year should be divided into four usual periods of 10 weeks each, and another ten-weeks term during the customary summer recess. This plan would allow a week's vacation at Christmas time and another week in the summer.

The New York State Legislature provided for the registration and supervision of summer high schools in the cities and villages of the State employing superintendents of schools. A number of such summer high schools were conducted during 1925. The results were sufficiently encouraging to cause the State Department of Education to make enlarged plans for the following summer.

**PRE-SCHOOL EDUCATION.** The attention of psychologists was directed toward a more thorough understanding of young children. There were several institutions which were making extensive researches in child welfare. The Iowa State Child Welfare Research Station, in connection with the University of Iowa, received a grant of \$133,500 from the Laura Spelman Rockefeller Memorial Fund to be used for research in child development and child study.

The Merrill-Palmer School of Detroit, Michigan, provided one nursery school for children between eighteen months and three and a half years of age, and another for children between three and five years. There were adequate psychological laboratories and the school was equipped to offer courses in health and nutrition of young childhood. The school offered three fellowships for graduate study in the field of psychology and education of the pre-school child.

An Institute of Child Welfare Research was conducted by Teachers College, Columbia University. This institute was conducting studies relating to factors in learning by pre-school children, special nutrition, and the care and management of children in child-caring institutions. An educational clinic was operated, and a nursery school was conducted.

Other institutions throughout the country were giving attention to the pre-school child, and in a few places nursery schools have been established either as private enterprises or in connection with public schools.

**A PROPOSED FEDERAL DEPARTMENT OF EDUCATION.** For several years there had been a determined effort on the part of the National Education Association to secure a Federal department of education. The first bills that were introduced in Congress to secure this result carried with them appropriations amounting to at least a \$100,000,000. A new education bill was introduced into the Sixty-ninth Congress

which differed from former bills in that it did not provide for appropriations that might be used in connection with the different States. The bill was introduced by Senator Curtis and Representative Reed of New York. It had the backing of a large number of national organizations, such as The American Federation of Labor, The General Federation of Women's Clubs and the National Society, Daughters of the American Revolution.

The bill provided for the creation of

An executive department to be known as The Department of Education, which shall be under the control and direction of a Secretary of Education, to be appointed by the President, by and with the advice and consent of the Senate. The Secretary of Education shall receive a salary at the rate of \$15,000 per annum.

Section 2 provides that

There shall be in the Department of Education an Assistant Secretary of Education, to be appointed by the President and to receive a salary of \$7500 per annum. The Assistant Secretary shall perform such duties as may be prescribed by the Secretary of Education or required by law. There shall also be a solicitor, a chief clerk, and a disbursing clerk, and such chiefs of bureaus and such scientific, technical, and clerical assistants as may be necessary to carry out the provisions of this Act and as may be provided for by Congress from time to time.

The office of Commissioner of Education was to be abolished and his powers and duties were to be exercised and performed by the Secretary of Education. The Bureau of Education, the Federal Board of Vocational Education and the duties of the Secretary of the Interior with relation to the Columbia Institution for the Deaf and Howard University were to be transferred to the Department of Education.

Section 7 of the bill provides that

In order to coördinate the educational activities carried on by the several executive departments, and to recommend ways and means of improving the educational work of the Federal Government, there is hereby created the Federal Conference on Education, which will consist of one representative and one alternate appointed by the head of each department. The Federal Conference on Education shall not report as a body to any one department, but each representative shall report the findings of the Federal Conference on Education to his own department for consideration and independent action.

The particular duties of the department are described as follows:

(a) The Department of Education shall collect such statistics and facts as shall show the condition and progress of education in the several States and in foreign countries. In order to aid the people of the several States in establishing and maintaining more efficient schools and school systems, in devising better methods of organization, administration and financing of education, in developing better types of school buildings and in providing for their use, in improving methods of teaching, and in developing more adequate curricula and courses of study, research shall be undertaken in (1) rural education; (2) elementary education; (3) secondary education; (4) higher education; (5) professional education; (6) physical education, including health education and recreation; (7) special education for the mentally and physically handicapped; (8) the training of teachers; (9) immigrant education; (10) adult education; and (11) such other fields as in the judgment of the Secretary of Education may require attention and study.

(b) The department shall make available to educational officers in the several States and to other persons interested in education, the results of the research and investigations conducted by it, and the funds appropriated for printing and binding for the Department of Education shall be available for the printing and binding of the results of such research and investigations.

For the purpose of paying the salaries and the conducting of studies and investigations, and

for other necessary expenses, an annual appropriation of \$1,500,000 was provided.

In the past, Federal control of education had been greatly feared and any attempt to provide for Federal support of the public schools had met with decided opposition. This bill eliminated the possibility of Federal control of education in the different States, and it did not provide funds which could be used for the support of the public schools. It was claimed that the provisions of this bill would in no way interfere with parochial or private schools.

Those who favored a department of education urged that the States and local governments spent annually more than \$1,750,000,000 for public education. In order to spend this more wisely more thorough research is necessary. The National Committee on Schoolhouse Planning, after a careful study, reported that "the amount of waste in schoolhouse construction is enormous." It was estimated that there could be a saving of at least 5 per cent upon cost of building. A million children fail to be promoted each year. Research could undoubtedly reduce the tremendous loss resulting from these failures.

THE EDINBURGH CONFERENCE OF THE WORLD FEDERATION OF EDUCATION ASSOCIATIONS. The World Federation of Education Associations was formed at the meeting of the National Education Association at San Francisco in 1923. The first regular biennial conference was held in Edinburgh, Scotland, July 20 to July 28. The United States was represented by 180 delegates. The federation authorized the appointment of standing committees on pre-school, elementary, secondary and higher education. Resolutions were adopted in reference to international relations, character education, health education, teacher training and illiteracy. Dr. A. O. Thomas was reelected president and provision was made for the employment of a full-time secretary.

JULIUS ROSENWALD FUND. The Julius Rosenwald Fund was established for the purpose of assisting in erecting rural school buildings for negroes. The construction of buildings and the disbursement of the funds are administered by the State officers of education, and the buildings become public school property. A report covering the operation of the fund for 10 years showed that there had been coöperation with 14 Southern States, and that the fund had assisted in building 2512 rural schools for negroes. The total cost of these schools was \$10,111,000. The Julius Rosenwald Fund contributed \$1,860,000; negroes gave \$2,290,000; whites gave \$5,000,000; and the remainder was provided by public funds.

The school buildings that were constructed have a pupil capacity of 280,000, and a teacher capacity of 6240. There are 602 one-teacher buildings, 921 two-teacher buildings, 381 three-teacher buildings, 264 four-teacher buildings, and 258 above four-teacher buildings. There are also 86 teachers' homes.

See also UNIVERSITIES AND COLLEGES.

EGYPT. A kingdom in northeastern Africa, governed by a sultan since Mar. 15, 1922, after the termination of the British protectorate declared Dec. 18, 1914; occupying the valley of the Nile, the Libyan desert, the region between the Nile and the Red Sea and the Sinai peninsula; claiming jurisdiction also over the Sudan, which

claim, however, is denied by the British. Capital. Cairo.

**AREA AND POPULATION.** The total area of Egypt proper which is described above is about 383,000 square miles. This figure does not include the Sudan. The cultivated and settled area, comprising the Nile valley and delta is only 12,023 square miles. The last census of the settled area, taken in March, 1917, gave the total population at 12,750,918; estimated in March, 1924, 13,885,000. The chief cities with their populations according to the census of 1917 are: Cairo, 790,939; Alexandria, 444,617; Port Said (including Ismailia), 91,090; Suez, 30,996; Tanta, 74,195; Mansura, 49,238; Asyut, 51,431; Damanhur, 47,867; Fayum, 44,400. In the same year the population was distributed among the various religions as follows: Mohammedans, 11,658,148; Greek Orthodox, 854,778; Roman Catholics, 107,687; Jews, 59,581; Protestants, 47,481. The movement of population in 1923 was: Births, 588,853; deaths, 352,597.

**EDUCATION.** Elementary education is supplied by native schools called *Maktabs*. In 1923-24 the number of these receiving grants-in-aid and under government inspection was 2904, with 5839 teachers and 220,066 pupils, while those under the immediate direction of the government in 1924 was 245 with 32,240 pupils. In addition there are higher elementary and higher primary schools, a few schools for special and technical training, and higher colleges of law, engineering, military science, veterinary science, agriculture, pedagogy, commerce and accounting, medicine, and farming. The total number of schools under the control of the provincial councils in January, 1924, was 3435 with 271,139 pupils, while those directly under the ministry

of education had an attendance of 57,300 students. The centre of Moslem culture is the mosque and university of El-Azhar at Cairo.

**PRODUCTION.** The cultivable area of Egypt was estimated in 1923 at 7,976,795 feddāns (one feddān equals 1.038 acres), of which 2,936,698 could not be cultivated until reclaimed. About 62 per cent of the entire population is engaged in agriculture; most of the holdings are small. In March, 1924, there were 6953 foreign landholders holding 563,746 feddāns and 1,965,412 native landholders holding 5,034,170 feddāns; a total of 1,972,365 landholders with total holdings of 5,597,916 feddāns. The cotton area and crop for 1922-23 was 1,800,000 feddāns and 6,713,000 kantars; and, for 1923-24, 1,715,148 feddāns and 6,531,257 kantars. See **COTTON**. Other important crops with figures for 1923 are: Wheat, 1,536,881 acres and 1,106,420 tons; barley, 400,170 acres and 261,018 tons; beans, 488,998 acres and 323,293 tons; lentils, 82,749 acres and 38,835 tons; onions, 42,034 acres and 256,477 tons; maize, 1,864,994 acres; millet, 232,362 acres; rice, 185,892 acres; sugar-cane, 58,090 acres. Also see Table of Production by Countries under article **AGRICULTURE**. The principal mineral products in 1923 were phosphate rock (25,370 metric tons); petroleum (153,402 metric tons); and manganese iron ore (132,384 metric tons). Other products are building stone, clay, carbonate and sulphate of soda, gypsum, nitrate shale, salt, talc, turquoise, ochres, etc.

**COMMERCE.** The accompanying tables from the *Statesman's Year Book* of 1925 show the merchandise exported and imported in 1923 and 1924 and the distribution of the foreign trade by principal countries for the same years:

<i>Merchandise</i>	<i>Imports</i>		<i>Exports</i>	
	1923 £E	1924 £E	1923 £E	1924 £E
Animals and animal food products .....	1,613,406	1,822,800	524,629	618,847

United States .....	1,702,765	1,798,542	7,246,787	7,085,911

**FINANCE.** The 1923-24 budget showed an excess of £E4,180,629 revenues over receipts. The total revenues were £E36,254,947 and the total expenditures, £E31,466,480. The budget for 1924-25 also showed an excess of revenues over expenditures. The total revenues were £E34,400,000 and the total expenditures, £E34,275,483. In 1924-25 the chief items of revenue in order of their value were: Railways, indirect taxes, direct taxes, customs; and the chief items of expenditure were: Administration, service on the public debt, and railways. In April, 1924, the public debt was £E92,370,940 with an annual charge of £E3,552,266.

**COMMUNICATIONS.** Steamships, exclusive of warships, etc., entering the ports of Egypt in 1923 numbered 7293 of a net registered tonnage of 23,150,820; cleared, 7316 steamships of 23,159,881 tons. The figures for steamships include the transit of the Suez Canal. Sailing vessels entered numbered 2211 of 124,923 net tons; cleared 2279 of 127,264 net tons. Railways owned and operated by the state, Mar. 31, 1924, had a mileage of 2234 (exclusive of sidings); those owned by private companies, 852. The greater part of the private and about half of the state lines were in the delta region.

**GOVERNMENT.** By the constitution proclaimed April 20, 1923, Egypt was declared a sovereign state under a hereditary monarchy with a representative government. Equal rights, irrespective of race, language or religion, were guaranteed, as was the liberty of the individual and of religious belief. Executive power was vested in the king, who also exercises legislative power in concurrence with the legislature. The latter was to consist of a senate and chamber of deputies, the senate to be composed of three-fifths elected by universal suffrage and two-fifths appointed by the king (the term of office is 10 years; one-half is renewed every five years), and the chamber of deputies to consist of members elected by universal suffrage for five years. The king can dissolve the chamber of deputies, to which the ministers jointly and separately are responsible. Mohammedanism is the state religion and Arabic the official language. The throne was declared hereditary in the house of Muhammed Ali. The king at the beginning of 1925 was Fuad I, who acceded Mar. 16, 1922. The cabinet as organized Nov. 24, 1924, was made up as follows: Premier and Minister of Foreign Affairs, Ahmed Ziwari Pasha; Interior, Ismail Pasha Sidki (Dec. 9); Finance, Yussef Pasha Cattau; War, Mohammed Sadik Pasha Yehya; Education, Tewfik Pasha Rifaat (Dec. 1); Communications, Nakhla Bey et Motei; Public Works, Mahmud Bey Sedki (Dec. 2); Agriculture, Mohammed Sayed Abu Pasha Ali.

### HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** As announced in the preceding YEAR BOOK the Egyptian government decided to dissolve parliament and hold new elections in the early part of 1925. Excitement ran high as the time approached. The press throughout the British Empire was strongly against Zaghlul Pasha and just as strongly in favor of Ziwari Pasha who had agreed to all the demands of the British government after the assassination of General Sir Lee Stack. See preceding YEAR BOOK. Early in the year the government decided to hold the elections on March 12. The results of

the elections were supposed to foretell the attitude of the Egyptian government toward the Sudan question and the irrigation problem. At the end of January the government protested to Lord Allenby against the proposal to create a separate defense for the Sudan, claiming that it was impossible to break the ties that bound Egypt and the Sudan together. Despite this protest the separate defense force was organized. Trouble with Italy appeared imminent when the Egyptian government refused to hand over to that country the oasis of Jarabub, in accordance with an agreement made in 1919. Ziwari Pasha refused the request on the grounds that he considered the oasis within the territorial limits of Egypt and that the uncertainty of the coming elections and the serious external conditions did not warrant such an action. He stated that he was willing to sanction a provisional delimitation of the district, however. Italy held that the oasis was the basis of an arms smuggling plot of the Senussi tribe, with the intention of overthrowing Italian supremacy in Northern Africa.

**ELECTIONS.** When the elections were held in March the results were overwhelmingly in favor of the anti-British party led by Zaghlul Pasha. In spite of this mandate of the people Ziwari Pasha dissolved the new Parliament a short time after its assembling (during which time it elected Zaghlul president of the chamber) and ordered new elections for May 23. The cabinet was reorganized to include only anti-Zaghlul members. Conditions remained comparatively quiet after the dissolution of the legislature, despite the rumors of revolution and charges and countercharges of political trickery and knavery. During this period Lord Allenby resigned as British High Commissioner in Egypt and was succeeded by Sir George Lloyd, a Unionist member of Parliament. The British Foreign Secretary, Sir Austen Chamberlain, announced that the change in commissioners did not indicate any change in the British government's policy regarding the Sudan or Egypt. In certain quarters it was believed that Lord Allenby's resignation was due to friction with his home government because he favored a more liberal policy toward Egypt.

**SITUATION AT THE END OF THE YEAR.** Despite the announcement that new elections would be held in May, none actually took place and the cabinet of Ziwari Pasha continued to function, although bitterly assailed by the press and the opponents of the government. On November 21 a meeting was held of the members elected to the dissolved parliament, despite the fact that Ziwari's government had declared that such a step would be illegal. The body reelected Zaghlul Pasha president and determined to hold meetings until constitutional government was restored in Egypt. Zaghlul's house was picketed by soldiers as a precautionary measure against an uprising. This act only succeeded in bringing him all the more before the public eye and emphasizing the fact that Ziwari's government had lasted as long as it did merely because of the opposition of the British government to the return of Zaghlul to power. See ARCHAEOLOGY.

**EINSTEIN THEORY.** See ASTRONOMY.

**ELECTRICAL INDUSTRIES.** The year was marked by great activity and prosperity in electrical undertakings. The demands of manufacturers for power, the rapid growth of com-

munities and the increasing appreciation by the public of the availability, reliability and convenience of electric energy for manifold purposes stimulated the activities of financiers, engineers and manufacturers of all kinds of machinery and apparatus for the utilization of electricity. According to a careful statistical survey conducted by *Electrical World*, the total output of electric energy by central stations during 1925 amounted to 59,517,000,000 kilowatt hours, as compared with the 1924 output of 54,413,403,000 kilowatt hours. For this service, the companies received \$1,470,000,000, the largest amount on record. During the same period, there was expended by the electric systems \$279,140,000 for generating plants and \$404,750,000 for transmission and distribution systems; a total outlay of \$683,890,000.

At the close of the year, there were approximately 6000 light and power systems in the United States operating 4800 central stations with a generating capacity of 26,830,000 kva., and supplying 17,937,160 customers. This last number was part of a population of 63,100,000 estimated to be living in electric-lighted dwellings. For the rapidly increasing development of the many electric power undertakings, construction of new generating stations, transmission lines, etc., a large sum of money must of necessity be raised. The *Electrical World* was also authority for the statement that the total issue of new securities by light and power companies amounted during the year to \$1,271,000,000, figures for the last week of December being estimated. Owing to the favorable situation of the money market throughout most of 1925, much of this new capital was devoted to refunding purposes.

An important fact concerning the status of the electric industry was that the gross revenue of all electric companies, \$1,470,000,000, was obtained from an average charge of 7.5 cents per kilowatt hour; but considering the enormous increase in capitalization and output of energy as compared with the higher rates charged up to the period of only a few years ago, the relative cheapness of electricity can be appreciated. The electric companies were especially active also in the merchandising of household appliances such as vacuum cleaners, washing machines, ranges, irons, table appliances including percolators and toasters; and refrigerating outfits. These last were made the special object of an intensive selling campaign, with, it was believed, highly satisfactory results.

There were 280,000,000 incandescent lamps sold, such as are used in the lighting of homes, an increase of  $7\frac{1}{2}$  per cent over the sales during 1924. Furthermore, 195,000,000 additional miniature lamps, for automobiles, Christmas trees, flashlights, etc., were bought by the public. Manufacturers of radio goods, benefiting by the standardization undertaken in some lines of such apparatus, made unusually large sales. Tubes, batteries, loud speakers and other radio accessories were in large demand throughout the year.

Exports of electrical merchandise from the United States were in practically the same volume as in 1924, some lines showing heavy decreases, while others made a better showing. Radio apparatus was sent out in large quantities and wiring devices of various kinds made slight gains over the preceding year; while electric mo-

tors were exported in smaller quantity and there was a marked falling off in electric railway locomotives. These, for the first 10 months of the year were valued at only \$189,566 as compared with a total of \$1,912,418 in 1924. As to the distribution of American goods, no marked change was shown, practically every country in the world being represented on the export list.

**ELECTRIC LIGHTING.** Progress during the year, while not spectacular, was steady. Active steps were taken toward the dissemination of knowledge of the fundamentals of illumination for streets, industrial plants, schools and homes. The central station companies freely gave information, particularly to the small consumer, on how to obtain better illumination in their homes, conserve eyesight and lighten the burden of their daily tasks. At the suggestion and with the cooperation of the National Electric Light Association, classes in illuminating engineering for salesmen of the electric service companies were held in many of the larger communities. Visits were made to lamp factories, laboratory tests were explained and in every manner possible interest in better illumination was stimulated. Lectures by lighting experts were given in educational institutions and in a large number of high schools prizes were awarded for the best essays on home lighting. It was reported that nearly one million pupils took part in this contest.

Industrial and shop window lighting improved in quality during the year. Factory architects and managers worked together to the end that illumination should be better distributed and properly adapted in quality and intensity to the work at hand. In store windows, goods were displayed to better advantage by careful attention to good illumination. In certain lines, flood lighting was resorted to in order to assist the window display. Advertising sign lighting was as formerly a prominent feature of street illumination in many cities, although there were no new features in connection with this phase of activity. Street and highway illumination received extensive investigation and showed some improvement; the former in many cities being much improved by the installation of units of plain design and substantial construction. Highway lighting still presented some difficulty on account of the confusion of fixed lights with the glare of approaching motor car headlights. The condition of the surface of the roadway, the steepness of the grade and other factors rendered the problem somewhat difficult of solution.

Traffic in congested city streets was facilitated by arranging the signal lights so as to operate in synchronism and thus save time in conveying the information of a clear road to drivers, also effecting a great reduction in the number of traffic policemen required. Considerable study was made of the conditions best suited to the illumination of beacons for night flying, best type and candle power of lamps to employ, etc.

A new standard for the comparison of candle power of lamps was developed as the result of several years' work by the U. S. Bureau of Standards and a committee of specialists appointed for that purpose. It depended for its operation upon the fusion of a platinum strip suitably mounted in order to enable measure-

ments to be made of the radiations of a "black body" at the melting point of platinum. No authoritative results of its use had been made public at the end of the year.

**ELECTRIC POWER TRANSMISSION.** Substantial progress was made in the development of long distance transmission of energy. While a truly super-power system had not yet been achieved, the increasing size and closer interconnection of many of the larger systems was rapidly bringing nearer the advantages to industry that such a system would possess. Small and medium-sized undertakings were being grouped together into larger, more efficient stations, a tendency noted in 1924. (See YEAR BOOK, 1924, *Electric Power, Transmission of*). While steel towers on long lines had become standard construction, in certain localities it was found better to employ wood poles. For instance, in California, a power line 77 miles in length was built on cedar poles, the butts of these being treated with preservative compound. The line operated at high tension, with capacity of 110 kv., and was reported to be highly satisfactory. Two high tension lines in California, designed to operate at 220,000 volts, that had been under observation during almost two years, were put in service supplying energy in 1925 and fully met the expectations of the designers and builders.

Great advances were made in the design, construction and installation of underground cables for the transmission of electric energy. In several large cities, cables with sufficient strength to carry energy at 32,000 volts had been put in during the past three years. Towards the end of 1924, the New York Edison Co. installed one rated at 45,000 volts, and during the past year another of 66,000 volts was put in service. Engineers of the company were working on the design of a cable that could be dependably operated at twice this voltage, and it was expected that the new cable would be installed early in 1926.

**ENCEPHALITIS, EPIDEMIC (SLEEPING SICKNESS).** This puzzling affection by 1925 had prevailed for nearly ten years and while our knowledge of it was steadily accumulating, the cause and manner of transmission were still elusive. Any knowledge of predisposing causes was welcome and in the *Journal of the American Medical Association* for October 31, Dr. Browning, the neurologist of Brooklyn, gave data to uphold the view that insomnia is one of these. It is not so much habitual involuntary sleeplessness that is meant but deliberate late hours, whether for the purpose of dissipation, overwork and overstudy, or from professional hazards. In analyzing a large number of cases this element seemed to be the most constant among the possible casual factors. The author, however, places a different valuation on the amount of sleep normally demanded than some physiologists, for he regards  $6\frac{1}{2}$  hours in 24 a deprivation, even if

the subjects seem to be in full health and vigor. Otherwise stated we could say that plenty of sleep—say eight hours a day—is a preventive factor. It is significant that physicians show a greater predisposition than the general public—according to the author 16 fold greater; and while this might be explained in part by exposure to contagion it is more apt to be due to defective sleep.

**ENGLAND.** The term in its strictest sense applies to the largest and most densely populated part of the island of Great Britain. As employed in reference to the government it often indicates the United Kingdom and Ireland. See **GREAT BRITAIN**.

**ENGLAND, CHURCH OF.** This is the established church of England and originally comprised Ireland and Wales; its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King of England is the supreme governor, with the right to fill vacant archbishoprics and bishoprics. There are, however, many deaneries, prebendaries, and canonries under the appointment of the First Lord of the Treasury, and many other offices under that of the Lord Chancellor. For administrative purposes the country is divided into two provinces: the Convocation of Canterbury and the Convocation of York, each under the control of an archbishop. There are (including the Church of Wales) 41 bishops and 38 suffragan and assistant bishops, with 34 deans and 100 archdeacons under their control.

Early in the year 1925 St. Paul's Cathedral was reported to be in a serious condition and the Dean and Chapter issued an appeal for £140,000 to save it from falling. Through the *Times* a substantial fund amounting by September to over £25,000 was contributed for this purpose so that in March the restoration work was begun and the greater part of the cathedral was closed to the public for an indefinite period. On February 3 Canon Daniel Davies was elected Bishop of Bangor and on July 17 Dr. Banks Strong, Bishop of Ripon, was translated to the diocese of Oxford, made vacant by the death of Dr. Burge (q.v.). On September 26 Dr. Edward Arthur Burrows, Dean of Bristol, was appointed Bishop of Ripon. On October 6 a Church Congress opened at Eastbourne, the Bishop of Chichester presiding. In a sermon which provoked considerable discussion both in England and the United States, the Archbishop of Canterbury attributed the small congregation to the poorness of the sermons preached. During the year the Dean of York, W. F. Norris, was appointed Dean of Westminster, and the Rev. Lionel Ford, Headmaster of Harrow, was appointed Dean of York.

Statistics for the Church of England showed that in 1923 there were 506,415 baptisms, and

the Easter communicants in the various dioceses numbered 2,413,874. The total gross income of 12,936 incumbents was £6,228,776, including £194,279 contributed as Easter offerings. The stipends of the assistant clergy were £1,047,070. The amount of voluntary parochial contribution in the 38 dioceses of England was £6,885,605, and the totals from all sources was £9,589,943. The Central Board of Finance of the church reported receipts in 1924 amounting to £116,519, of which sum diocesan contributions amounted to £95,460. The total expenditures for the year were as follows: Ex-service and civilian training, £43,114; religious education, £18,711; special purposes, including the Japanese Church Relief Fund, £880; missionary council, £2,910; pensions committee, £1,041; investments of gifts, £6,623; reduction of deficiency from previous years, £20,418; general administration, £22,243.

The National Assembly was established in 1920, to deliberate on all matters concerning the church and to make provision in respect thereof. The Assembly consists of three houses, composed of Bishops, Clergy, and Laity respectively. The first two houses consist of the Convocations of Canterbury and York, of which the respective Upper Houses form the House of Bishops and the respective Lower Houses, the House of Clergy. The House of Laity comprises representatives of the laity of the Provinces of Canterbury and York, elected for five years by the lay members. The Archbishop of Canterbury was chairman of the National Assembly in 1925, and the Archbishop of York, vice-chairman. The Archbishop of Canterbury was chairman of the House of Bishops and the Archbishop of York was vice-chairman. The Dean of Westminster was chairman of the House of Clergy, and the Archdeacon of St. Albans was vice-chairman. The Earl of Selborne, K.G. was chairman of the House of Laity, and Lord Daryngton was vice-chairman. The Assembly, at its sessions of 1925, passed measures on interpretations and on the Bishopric of Leicester.

**ENTOMOLOGY, ECONOMIC.** The year was marked by the continued extensive spread of the European corn borer into the Corn Belt, the oriental peach moth into fruit producing districts, the Mexican bean beetle northward and westward, and the satin moth along the Atlantic shore in New England. No less noteworthy were the discoveries or adaptations made of numerous insecticides. The advance made in the use of the airplane for the application of insecticide dusts for the control of the cotton boll weevil, curculio on peach, and mosquitoes was especially noteworthy. The eradication of the pink boll worm from eastern Texas and Louisiana, which appeared to have been accomplished, marked one of the greatest achievements in applied entomology.

**COTTON BOLL WEEVIL.** The year 1925 as a whole saw a comparatively light or subnormal infestation by the boll weevil, making a second in succession. The closely related form occurring on wild cotton in Arizona was found attacking cotton grown near by, and attempts are being made to prevent its spread.

**PINK BOLL WORM.** No new area of infestation by the pink boll worm developed in the humid area of Texas and Louisiana, and the pest was still confined to certain areas in western

Texas and New Mexico which, because of their proximity or contact with infested areas in Mexico, must continue to be subject to reinfestation. The invasion of Porto Rico was practically completed, and its occurrence in Queensland, Australia, definitely established.

**ORIENTAL PEACH MOTH.** The oriental peach or fruit moth continued to spread, and it was infesting the territory east of the Allegheny Mountains, all the southeastern United States as far west as the Birmingham district of Alabama, and had appeared in Texas and Arkansas. The commercial orchards in Georgia had not as yet been invaded to any extent. In control work in New Jersey, Stearns (*New Jersey Stat. Circ.* 175, 1925) had found plowing in May, followed by disking to a depth greater than three inches, to destroy 100 per cent of the overwintering larvæ and pupæ on the ground about the tree. A combination fungicide-lead arsenate-nicotine (1-800) spray gave the best control, resulting in an increase in clean fruit of 13.3 per cent.

**JAPANESE BEETLE.** Assisted by the quarantine of farm products, the local spread of the Japanese beetle was restricted, having been the smallest in proportion of any year on record. Its economic importance, however, rapidly mounted, due to its increase in the infested area. A new attractive agent known as Geraniol was developed, by means of which the beetles can be attracted to a limited area where they can be killed by a contact spray consisting of oleoresin of pyrethrum and soap.

**EUROPEAN CORN BORER.** The European corn borer continued to spread, and from its western focus, including a wide belt surrounding Lake Erie, is now making a rapid advance into the Corn Belt. During the year approximately 18,000 square miles of territory in Michigan, Ohio, Pennsylvania, and New York was invaded by it.

**GIpsy Moth.** While the gipsy moth infestation was light over most of the infested area, more eggs were deposited than in the preceding season. There was, however, a very sudden increase on Cape Cod, where nearly 25,000 acres were completely defoliated. The barrier zone on the western border of the infestation was scouted and only small infestations located, all of which were treated. The territory infested in New Jersey has been so greatly reduced that only one focus was located within the outside area, fewer infestations having been found than at any time since the gipsy moth was discovered in that State. An infestation discovered at Henrysburg, Quebec, in 1924 was thoroughly treated, and no new infestations located. No change was made during the year in the area quarantined.

**BROWN-TAIL Moth.** This moth caused considerable defoliation in neglected apple orchards in southern Maine and New Hampshire. The infestation was light over most of the infested area, and no change was made in the quarantined area.

**SATIN Moth.** The satin moth spread rapidly during the year, poplars and willows being entirely defoliated in many towns extending from Cape Cod to the southern part of Maine. It was occurring in southern Maine and New Hampshire, as far west as central Massachusetts and the eastern third of Rhode Island, and local-

ly in the State of Washington. The quarantine placed against its spread by the Federal Horticultural Board was extended on November 3 to include the States of Maine, Rhode Island, and Washington.

**MEXICAN BEAN BEETLE.** This beetle continued its spread westward in Tennessee and Kentucky, and at the end of 1925 was occurring over the greater part of West Virginia, southwestern Pennsylvania, southern Indiana, and practically all of Ohio.

**SWEET POTATO WEEVIL.** The eradication campaign conducted against the sweet potato weevil showed consistent progress in Florida and Mississippi.

**OCCURRENCE OF INSECT PESTS.** The San José scale continued its attack upon fruit trees and was particularly serious in Virginia, Georgia, and Illinois. The codling moth was generally more prevalent in the East Central States than during the three years preceding. The beet leafhopper was discovered to occur on sea purslane at Miami, Florida, indicating that it may become an enemy of sugar beets in the East. The asparagus beetle made its appearance in the Yakima Valley of Washington. The potato tuber moth caused an almost complete loss of the late potato crop in the southern part of the Eastern Shore district of Maryland and Virginia. The cotton hopper or flea was less important than in 1924. The most serious infestation of cotton by the bean thrips ever recorded took place in southern California. The alfalfa weevil, spreading eastward over the Divide, entered eastern Wyoming, and two additional counties in California were invaded. The damage by the Hessian fly to wheat continued, an analysis made in Kansas in September indicating a reduction in that State alone of at least 40 million bushels. A colony of the European earwig was discovered at East Aurora, N. Y., and a successful campaign of control was put on by the city of Albany in Oregon. The oriental Anomala beetle continued to increase in New Haven, Conn., and plans to eradicate it were inaugurated. The appearance of the elm leaf beetle in California at Fresno was reported. The European shoot moth appeared at six different points in Ontario.

**INSECT CONTROL.** It was pointed out that the common arsenical insecticides may be so manufactured that they contain an absorbed positive ion, and then show great adherence to plants and resist the washing effects of rain and dew. By coating arsenate of lead with lead oleate, by a newly perfected method, this arsenical is no longer a repellent to the beetle; it spreads evenly, adheres well to the foliage, and is practically unaffected by rain, resulting in a saving of material and a reduction in the number of applications necessary. Sodium fluosilicate was found to kill the Mexican bean beetle more rapidly and at less expense than arsenicals. It was also effective against blister beetles. A bait containing sodium fluoride was found to have several advantages over other baits used for cutworms. It was pointed out that all emulsions stabilized with any of several colloidal substances, such as casein, milk, etc., are miscible with deep-well or hard waters and also with lime sulphur solution at dilutions varying from 1-10 to 1-100.

A new emulsion developed for use against the Japanese beetle as a soil insecticide, known as carbon-disulphide potassium-oleate alcohol emulsion, which does not stratify on standing as do carbon-disulphide emulsions, was used extensively and successfully by commercial concerns. Fish oil was found to be an efficient adhesive in arsenate of lead sprays. Two per cent lubricating oil emulsion made from either the boiled or cold formula gave excellent control of the San José scale on peach in Georgia without tree injury, even when used twice in one dormant season. In the Northwest, at Yakima, the use of a 4 per cent lubricating oil emulsion was found necessary to destroy 99 per cent of the scales. The insecticidal value of highly refined lubricating oils used against the citrus red scale was found to depend upon their mechanical properties rather than upon any inherent toxicity. Caseinate spreaders were found to detract from the effectiveness of oil sprays when used experimentally on San José scale and on eggs of the leaf roller. The lighter lubricating oil sprays were found to kill as high as 98.8 per cent of the eggs of the fruit tree leaf roller. The onion maggot was found to be largely held in check by Bordeaux oil emulsion at a cost much lower than the less effective corrosive sublimate.

The superheating of rooms to a temperature of 120° F. or above for several hours, which can be easily done during the hot summer weather by turning on the steam heat, was found to destroy practically all bedbugs. The discovery of the insecticidal value of the aliphatic fatty acids in the free condition bade fair to be far-reaching in its effects. When prepared from coconut fatty acids and compared pound for pound with commercial 40 per cent nicotine sulphate preparations for aphid control, equally good results have been obtained and at a much lower cost per gallon of spray mixture. This series of products had been patented and soon was to be placed upon the market under license by the inventors. Aphid infestations of cauliflower beds were controlled by the use of nicotine dust hydrated mixtures.

An exceedingly high percentage of the adults and nymphs of the grape leafhopper were killed by both the "A" and "B" calcium cyanide dusts in Pennsylvania, thus confirming the results obtained in California. A nonexplosive and noninflammable gas composed of ethyl acetate in combination with carbon tetrachloride was recommended for use in the fumigation of grain, in grain cars, etc. A vacuum of from 28 to 29 inches was found to be very effective in killing insects most commonly found in storage.

**AIRPLANE APPLICATION OF INSECTICIDES.** One of the most notable advances of the year was the adaptation of the airplane to the application of insecticide dusts. In control work with the boll weevil some 80,000 acres of cotton were dusted with calcium arsenate by a commercial company, with every prospect for a marked increase in 1926. What was apparently the first dusting of fruit orchards by airplane was made in Georgia, where a combined insecticidal and fungicidal dust was applied for control of curculio on peaches at the rate of about 5000 trees per hour. The results obtained were prac-

tically as good as those from the ground machines, with which they were compared. Tests being made to determine the feasibility of distributing dry larvacides over large areas by airplanes for control of mosquitoes have proved very successful, over 99 per cent of the larvae in an area of 40 acres having been destroyed in one of the applications. The feasibility of applying dusts by airplanes for control of the alfalfa weevil is indicated by the preliminary experiments conducted.

**INSECT QUARANTINES AND EMBARGOES.** A new domestic quarantine against the West Indian fruit fly and the bean pod borer in Porto Rico became effective July 1, and other quarantines were extended, including those maintained against the Japanese beetle, European corn borer, and satin moth. A rehearing was held by the Secretary of Agriculture, on November 17 and 18, on the embargo against certain foreign bulbs, scheduled to become effective Jan. 1, 1926. On December 30 the Secretary announced his approval of the restrictions on the entry of narcissus bulbs and disapproval of the restrictions on other bulbs, which will be permitted entry under permit and inspection pending further investigation.

**APICULTURE.** One of the important developments in this field was the report of the Federal Bureau of Entomology (*U. S. Dept. Agr. Bul.* 1328) upon a newly devised electromechanical apparatus, by means of which the flight of bees to and from the hive can be quite accurately determined. This opens up a wide field for investigations on the flight activities of bees. A satisfactory grader was perfected which embodies all the features desired in a honey color grader (*U. S. Dept. Agr., Dept. Circ.* 364). The alcohol-formalin solution, consisting of 20 per cent formalin in alcohol, invented for treating combs infected with American foulbrood, appears to successfully sterilize such combs.

**NECROLOGY.** The year saw the passing of several leaders in the field of economic entomology, including Dr. Walter D. Hunter of the Federal Bureau of Entomology, on October 13, at the age of 50; Prof. Harry A. Gossard, President of the American Association of Economic Entomologists and Entomologist of the Ohio Experiment Station, on December 18, at the age of 57; and Prof. Harry Maxwell-Lefroy, the English Entomologist, on October 14, at the age of 48. Albert Koebele, who introduced the Australian *Vedalia* ladybeetle enemy of the cottony-cushion scale into California, died on Dec. 28, 1924, at the age of 72. Dr. Samuel T. Darling, well-known investigator in medical entomology met an accidental death on May 20, at the age of 53.

**BIBLIOGRAPHY.** C. Fox, *Insects and Diseases of Man*, 1925 (Philadelphia, 1925); G. W. Herrick, *Manual of Injurious Insects* (New York, 1925); A. D. Imms, *A General Textbook of Entomology* (London, 1925); R. E. Snodgrass, *Anatomy and Physiology of the Honeybee* (New York and London, 1925).

**EPILEPSY.** An editorial in the *Lancet* for October 3 well summed up the present day treatment of this affection. Control of the seizures is still the main arm of the latter rather than attempts to oppose the cause. Experience bears out the contention that small groups of

cases may benefit by treatment which fails on a large scale. Thus borax and belladonna undoubtedly are of value in special cases. Benefit from the bromides is inseparable from the collateral ill effects. Protein or peptone shock treatment, colloidotherapy and the endocrines are still on trial, and may possibly be found of value for the individual case.

Luminal appears to be making good throughout the world, or at least in the United States, Great Britain, France, and Germany. Even in the hopeless case accompanied by mental defect the results are relatively good, for with suppression of the fits the mental state improves. Thus far it is impossible to separate the groups of patients who benefit most from luminal, beyond the fact that subjects with major epilepsy do better than those with minor and psychical seizures. Luminal must not be discontinued too abruptly lest *status epilepticus* develop. The drug appears to be especially valuable in the major crises of epilepsy in children. When luminal fails outright we may suspect that the disease is hysteria and not epilepsy. It is claimed that luminal exerts an unfavorable influence on the epileptic character; and that certain subjects, especially children, show such after-effects as irritability, restlessness and stupor. Drug rash is seen at times. What has been said in the way of criticism of luminal has no connection with the effects of overdoses. The largest safe adult dosage is 3-4 grain in 24 hours. In regard to curative treatment a few cases recover permanently after surgical intervention and a few others appear to have been conquered by psychoanalysis. In such cases treatment is not directed against the fits although the latter may disappear during or after the treatment.

Some remarkable results have recently been published on the use of the so-called ketogenic diet in epileptics. This consists of the restriction of protein and carbohydrates with an unrestricted use of fats, the immediate result of which is the production of an acidosis, shown by the presence of acetone and diacetic acid in the urine. According to the report of Peterman of the Mayo Clinic which appears in the *Journal of the American Medical Association* for June 27, the high fat diet caused a notable reduction in the number of seizures, this claim having been sustained by several other investigators.

**EPÍRUS.** A geographical expression applied to a territory, the northern part of which belongs to Albania and the southern part to Greece. The boundaries are indefinite. The Greek portion corresponds to the departments of Yanina and Prevesa, with populations in 1920 of 167,485 and 46,209 respectively. Northern Epirus had an estimated population of 250,000.

**EPISCOPAL CHURCH.** See PROTESTANT EPISCOPAL CHURCH.

**EPWORTH LEAGUE.** See articles on the Methodist denominations, METHODIST EPISCOPAL CHURCH.

**ERB, NEWMAN.** An American Railway President, died March 25, at New York. He was born at Breslau, Germany, June 16, 1850, and came at three years of age to St. Louis, Missouri. Educated in the public schools, he became private secretary to the Vice-President of the Life Association of America and studied accounting,

later becoming associated with a St. Louis business firm. Studying law in 1872 he was admitted to the bar and practiced at Little Rock, Arkansas. There he founded two newspapers, one in English and the other in German. In 1881 Mr. Erb was active in the construction of the Memphis extension of the Kansas City, Fort Scott and Gulf, later a portion of the Frisco System. He became a director and took charge of its legal interests for Arkansas and Tennessee. For the Mississippi River Bridge at Memphis, he secured the charter. In 1886, receiver of the Memphis, Selma and Brunswick, he completed the road from Memphis to Holly Springs, Miss., and it was taken over by the Kansas City, Fort Scott and Memphis. He became General Manager of the line, extended to Birmingham, Alabama, as the Kansas City, Memphis and Birmingham. In the latter corporation he was a director, with charge of the law department. In 1885 Mr. Erb organized the Western Telegraph Company. Taking in hand the Kansas City, Wyandotte and Northwestern, he completed it from Kansas City to Virginia, Nebraska, with several branch lines, serving as Vice-President, President and later as receiver. In 1892 Mr. Erb removed to New York. There he acquired for clients several lines, which were reorganized or turned over to larger systems. Notably, he secured control of the St. Louis, Cape Girardeau and Western and several small lines in southwestern Missouri and northwestern Arkansas which were combined to make the shortest route between St. Louis and Memphis on the water level. The road was sold to the St. Louis and San Francisco. In 1898 Mr. Erb was active in the syndicate which acquired control of the Pere Marquette. In 1903 he organized a syndicate to purchase the Cincinnati, Hamilton and Dayton, which in turn acquired the Pere Marquette. Mr. Erb, with a syndicate, secured control of the Wisconsin Central about 1900, but retired from this group for a time. In 1908 he took control of the property, as chairman of the board and president. The line was sold in 1909 to the Minneapolis, St. Paul & Sault Sainte Marie. Mr. Erb served in 1902 as temporary receiver of the Chattanooga Southern, later acquired full control, and was president of the Tennessee, Alabama and Georgia, its successor. In 1910 Mr. Erb at the head of a syndicate came into control of the Ann Arbor Railroad. He was its president from December, 1912, to his death, and also president of the Manistique and Lake Superior Railroad Company. Mr. Erb also was president of the Minneapolis and St. Louis from October 9, 1911, to September, 1916, and of the Iowa Central. In 1912 he controlled the Denver, Northwestern and Pacific. Mr. Erb had many other interests including public utilities of which in 1904 he controlled some 20 in different parts of the country. In 1907 he was president of the British Columbia Copper Company and in 1910 of the New Dominion Copper Company.

**ERITREA.** A colony in Africa belonging to Italy. It lies on the coast of the Red Sea, extending from Cape Dumeirah and the Strait of Bab-el-Mandeb to Cape Kasar, a distance of 670 miles. Area, 45,754 square miles; population, estimated at 402,793 natives and 4251 Europeans, according to the census of 1921. The seat of government is Asmara, situated 7765 feet above sea-level, with a population of 14,711, of whom

2500 are Europeans. The principal trade centre is Massawah, with a population of 2275 in 1923. The natives are chiefly Coptic Christians and Mohammedans and they speak a dialect of Abyssinian in the plateau region and Arabic in the lowlands. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products. Although there is abundant pastoral land the pastoral population is largely nomadic. There is a considerable trade in palm nuts, and pearl fishing is pursued at Massawah and in the Dahlak Archipelago. In 1923 the value of exports from Massawah was 36,729,437 lire; imports, 106,103,072 lire. In the same year the imports through the land frontier were 37,964,305 lire and the exports 29,472,192 lire. The tonnage of vessels entering Massawah in 1923 was 436,100. For the fiscal year 1924-25 the revenue and expenditure of the colony were estimated at: colonial revenue, 36,439,000 lire; expenditure, civil administration, 25,074,000 lire; military, 11,365,000 lire. Governor at the beginning of 1925, Dr. Jacopo Gasparini.

**ERIVAN.** See ARMENIA.

**ESKIMO PROBLEMS.** See POLAR RESEARCH.

**ESKIMOS.** See ANTHROPOLOGY.

**ESPERANTO.** See INTERNATIONAL LANGUAGE.

**ESSAYS.** See LITERATURE, ENGLISH AND AMERICAN.

**ESTHONIA.** A new Baltic state comprising the following portions of the former Russian Empire: The province of Esthonia, the islands of Moon Sound, the northern part of Livonia, part of the northwestern district of the Pskov government, and a small portion of the Petrograd government; declared independent Feb. 24, 1918, and recognized by the Supreme Council, Jan. 26, 1921.

**AREA AND POPULATION.** The total area is about 16,955 square miles; population at the preliminary census of 1922, 1,110,538, of whom 92 per cent were Esthonians, 1.5 per cent Germans, and 6.5 per cent Russians and other nationalities. In religion five-sixths of the population are Lutherans and the rest Greek Orthodox, Roman Catholics, etc. The capital is Tallinn or Reval with a population in 1924 of 140,000. Dorpat (Tartu), the seat of the university of the same name, had about 50,000 inhabitants. Other large towns are: Narva, a manufacturing town, with about 27,000, and Parnu, on the Gulf of Riga, with about 18,500.

**PRODUCTION.** The chief occupation is agriculture. Ever since it became independent the Esthonian government has encouraged agriculture by partitioning the larger estates into smaller holdings, under the Agrarian Reform bill of Oct. 10, 1919. The total area of about 10,851,648 acres is divided as follows: Forest land, 2,220,002 acres; fields 2,532,799 acres; meadows, 2,602,274 acres; pastures, 1,836,302 acres; untillable land, 1,632,206 acres (including a peat bog of 496,112 acres). The principal crops with acreage and yield are shown in the accompanying table taken from the *Statesman's Year Book* for 1925:

	Acreage		Yield in tons	
	1922	1923	1922	1923
Rye .....	392,268	406,170	145,680	189,265
Wheat .....	52,271	56,207	21,060	20,080
Barley .....	331,291	312,031	145,214	89,283
Potatoes .....	186,678	178,661	177,752	682,917
Oats .....	398,844	377,677	146,097	115,865

The livestock census of 1923 showed 512,625 head of cattle, 665,938 sheep, 338,360 pigs, and 209,815 horses. In the same year Esthonia had 1266 industrial establishments which employed 45,424 workmen.

**COMMERCE.** In 1923 the trade amounted to 21,494,527 pounds (62 pounds equals one ton) of imports valued at 9,332,279,850 Esthonian marks, and 17,043,233 pounds of exports valued at 5,711,956,170 marks. Of the total imports, 8,102,083 pounds came from the United Kingdom and 6,728,333 pounds from Germany; of the total exports, 10,854,545 pounds went to the United Kingdom and 1,467,027 to Finland. The chief exports were flax, timber, paper, butter, and cement. The principal imports were coal, salt, rye, wheat, wheat flour, and sugar. In 1924 the imports totaled 8,050,000,000 marks and the exports, 7,865,000,000 marks.

**FINANCE.** The Esthonian budget for 1925 as submitted to parliament, provided for ordinary and extraordinary expenditures totaling 7,293,000,000 Esthonian marks, compared with 7,218,000,000 for 1924 (\$1 equals 392 Esthonian marks). Ordinary revenue for 1925 was estimated to yield 7,053,000,000 marks, or somewhat more than the 6,624,000,000 marks estimated for 1924. As a result the estimated deficit was reduced from 594,000,000 marks calculated for 1924 to 240,000,000 marks for 1925. Actual receipts during 1924 totaled 7,088,481 marks, while actual expenditures reached a total of 7,061,604,000 marks, thus leaving an accounted surplus of 26,877,000 marks. However, as this result was accomplished by including in the revenue a sum of 342,000,000 marks taken from the state cash reserve, the principal budget, properly speaking, produced an actual deficit of 315,123,000 marks. In addition to the principal budget, three supplementary budgets were voted during 1924, with additional expenditure of 492,613,000 marks and without any corresponding increase in revenue. This brought the total preliminary deficit for 1924 to 807,736,000 marks.

**COMMUNICATIONS.** Vessels entering the ports in 1923 numbered 9164 of 1,115,571 tons, and the merchant marine in the same year comprised 72 steamers and 344 sailing vessels with a total tonnage of 57,229. The railway mileage was 768. At a meeting of the Esthonian Economic Council during the summer a project regarding the extension of the Esthonian railway net was passed. The project, which had been elaborated by a special commission, embraces the construction of several new lines, of which the following are to be built first: Broad gauge, Dorpat to Petchory and Narva to Kulga; narrow gauge, Pernau to Lelle, Taps to Syranetz, and Reval-Loksa-Taps-Fellin-Dorpat.

**GOVERNMENT.** According to the constitution of the Esthonian republic, passed by the Constituent Assembly, June 15, 1920, executive authority is in the hands of a state head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of this State Assembly of 100 members, elected for three years on the basis of proportional representation and by universal, direct, equal, and secret suffrage. The Assembly forms the government and accepts its resignation, promulgates the laws, passes the budget, decides the financial policy generally, ratifies treaties, etc. The principle of the referendum is recognized for the proposal or amend-

ment of laws, but not in relation to measures affecting the budget, or war, peace, and foreign treaties. State Elder at the beginning of 1925, M. Jaakson (People's Party).

**HISTORY.** On January 16 and 17 a conference was held at Helsingfors at which the foreign ministers of Esthonia, Latvia, Finland and Poland were present. Among the decisions reached by the group were: an interchange of all news; commerce and travel should be facilitated; a better system of customs regulations should be devised; and a treaty of obligatory arbitration was drawn up. This last act received favorable comment in the entire press of the world. Lithuania remained away from this and subsequent conferences because of her hostility to Poland which was largely engendered by the Vilna controversy. See previous YEAR BOOKS. On March 25, the financial committee of the League of Nations issued the following statement concerning Esthonia: "The last five years have been a period of adaptation and creation. The Esthonian Government has therefore performed a remarkable task in having organized, out of the deficient material available, a State, which, in spite of the economic crisis through which the country has recently passed, appears at bottom to be both stable and prosperous, and in having maintained during the last three years a budget of equilibrium and an exchange which, if not stable, has, compared with the currencies of most other Eastern and Central European countries, fluctuated within narrow limits." This committee recommended the founding of a land bank. The government followed its advice. On October 28 an agreement was reached with the Debt Funding Commission of the United States concerning the Esthonian debt, which was placed at \$13,830,000. By the provisions of the settlement Esthonia could make semi-annual cash payments totaling \$1,000,000 on or before Dec. 15, 1930. The bonds to be issued in connection with the debt would run over a period of 62 years, bearing 3 per cent interest up to Dec. 15, 1923, and 3½ per cent thereafter. In November a law was passed separating the church and state in Esthonia.

**ETHNOLOGY.** See ANTHROPOLOGY.

**EUROPEAN FOWL PEST.** See VETERINARY MEDICINE.

**EVANGELICAL CHURCH.** This denomination was formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. A considerable number of the ministers and members organized themselves in 1892 into the separate denomination known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions, which drew up the so-called Enabling Act. The new organization was officially established at Detroit, in 1922. At the time of merging, the Evangelical Association had 167,416 church members and the United Evangelical Church 92,001. There were 2916 churches and 1856 ministers in the two denominations. Figures prepared at the end of 1925 showed a total membership of 248,606. There are 1992 itinerant preachers and 352 local preachers. Of 25,628 who were received into church membership in the year, 16,957 came in

on confession of faith. There are 2922 Sunday schools of which 590 are in the foreign mission fields in China, Japan, Germany, and Switzerland. Of the total enrollment, 390,691, China has 4277; Japan 8245; Germany 31,191; and Switzerland 15,817. The total amount raised by the Sunday schools was \$574,541.79. The Christian Endeavor Society membership is 74,179. There are 1380 Woman's Missionary Societies in the denomination, with a membership of 42,123. The total value of all property is \$28,950,352.86. The grand total of all money raised during the year was \$6,953,965.44, an average of \$20.10 to a member. The chief schools of the denomination are: Northwestern College and Evangelical School of Theology, Naperville, Ill.; Western Union College, Le Mars, Iowa; Albright College, Myerstown, Pa.; Schuykill College and School of Theology, Reading, Pa. Two orphanages and six Old People's Homes are maintained in the United States, as well as several hospitals. The Church has 25 conferences in the United States, one in Canada, one in Japan, two in Germany, one in Switzerland. There are two publishing houses. The Church issues two official papers, the *Evangelical-Messenger*, in the English language, and the *Christliche Botschafter*, in German. The next general conference meets in Williamsport, Pa., in October, 1926.

#### EVANGELICAL SYNOD OF NORTH AMERICA.

A religious denomination formed by a union of Lutheran and Reformed churches, effected in 1840, at Gravois Settlement, Mo., and in subsequent similar unions, forming organizations which consolidated in 1877. Their essential doctrine rests on the Biblical interpretations furnished by the Augsburg confession, Luther's catechism, and the Heidelberg catechism, allowing liberty where these do not agree. The church is organized into 19 districts, with extensive power of self-government. Presidents of districts, clerical delegates, and lay delegates meet in general conference every fourth year. The quadrennial synod met in 1925. The organization included in 1923, 1287 churches, 1179 pastors, 307,177 church members, and 1200 Sunday schools, with 177,706 school members. Money raised for all purposes by the denomination in 1923 reached the total of \$5,045,309. Church property is valued at \$30,467,613. Missionary work is carried on in the United States, India, Honduras, and South America. In the United States it occupies over 100 missionaries, men and women, active in some 135 communities. The Board of Foreign Missions reported for 1923 an income of over \$100,000, and had in India as missionaries 12 men, including a medical worker, and 17 women, all from outside India; and 333 native workers. In Honduras were 11 missionaries at two stations. Three institutions of learning were maintained: Eden Seminary, at St. Louis Mo., Elmhurst College, at Elmhurst, Ill., and Robinson Academy, at Waco, Texas. Periodicals are published, some in English and some in German, the chief ones being *Der Friedensbote* and the *Evangelical Herald*.

**EVOLUTION.** In the year 1925, as was the case 20 years before, and as doubtless will be the case 20 years later, there was among scientists universal acceptance of the theory of evolution, but a decided lack of agreement as to the relative values to be put upon the various proposed explanations of this process. The condition is

analogous to that of a Protestant and a Catholic who disagree on points of doctrine but agree on the fundamental principles of Christianity. In both cases this lack of agreement seems to be due to differences of temperament or of training, but while in religion no such conclusion would be drawn, unfortunately in the case of evolution this lack of agreement is claimed by hostile critics to mean that the theory has been largely abandoned. When Bateson emphasized on the one hand his belief in evolution, but on the other stated that we are still ignorant concerning the way in which new species arise, William Jennings Bryan quoted the second statement (ignoring the first) as proof that biologists are abandoning the whole evolution programme or at least show such lack of agreement concerning it as to seriously discredit the whole theory. Again, Weismann, through his critical studies on the effects of use and disuse, founded the school calling itself "Darwinian" but who out-darwined Darwin in claiming natural selection as the *only* explanation. The practical abandonment of this extreme position has been misinterpreted by those who fail to realize that "Darwinism" in this sense is not the same as "Evolution." Obviously the present-day problem is the discovery of the factors at work in the evolutionary process.

Of the various proposed explanations, natural selection is the one most generally employed, its severest critics having been forced to accept it as playing at least a subsidiary part. It would appear however that important modifications of the original theory must be made. In the first place it is probable that the severity of the struggle for existence has been overestimated. "Nature is stern but she has her tolerant moods," and it is questionable if minor variations have the rigid life-and-death-determining importance they were formerly supposed to possess. If this is the case we must discover some other cause for the origin of new species which often differ from the old in what seem to us unimportant structural details. To many workers this difficulty is met by the discovery of mutations, by which we mean the sudden appearance of changes which may or may not be quantitatively greater than individual variations, but differ from these in that they are transmitted to later generations and eventually become permanent characteristics of new species. While the causes of these variations are not clear, there is reason to suppose that they are due to changes in the complex unstable compound protoplasm, which is the basis of all living matter, and is by virtue of its complexity liable to isomeric modifications which change its character. While the validity of the mutation hypothesis has been questioned in certain specific cases (See Zoölogy, this volume), it seems at present writing to be an important adjunct to natural selection as an explanation of evolution.

The oldest explanation of evolution is that of use and disuse, originally proposed by Lamarck, and to a large extent accepted by Darwin. With the rise of the "Darwinian" school (as defined above), this Lamarckian factor seemed definitely to be disproved, but with the decline of "Darwinism" it has again come to the front. The main difficulty was to discover how it is possible for somatic changes to modify the germ plasm.

Throughout the entire discussion there have

been many who admitted this difficulty but who nevertheless felt that such a modification must occur, as otherwise observed changes could not possibly have taken place. The work of Guyer and Smith on anti-bodies (See YEAR BOOK for 1921) and increasing information concerning the action of one part of the body upon another through the action of hormones seems to point the way to a possible explanation of the mechanisms involved. A conservative statement is that at the present time the theory of use and disuse is stronger than it has been since Weismann's work in the 1889's seemed to entirely discredit it; not so much in its general acceptance (for before Weismann it was widely adopted in an entirely uncritical fashion), but in that there is now promise of an explanation of the mechanisms at work in such a process.

In a strictly natural selection explanation of evolution it is assumed that from generation to generation variations normally appear in all directions around a mean, and natural selection operates by eliminating all but the most favorable of these. Eimer in insects and Whitman in pigeons found reason to believe that in these animals variations affecting any one organ or part show a decided tendency to occur in only one general direction, rather than in all directions. This principle, known as *orthogenesis*, has been proposed as an explanation of why, in many cases, organs so obviously disadvantageous to an animal, have persisted. It is, for example, generally thought that the enormous unwieldy horns of the Irish Elk were largely responsible for its becoming extinct. Spencer attributed the size of these horns to the inherited effects of use, but in this case it is difficult to see why natural selection should not have kept the size within limits by the elimination of the most unfavorable variations, and the consequent preservation of the fittest. Orthogenesis assumes an inherent tendency to vary in this one direction even though the result is fatal to the race. Why variations should appear in only one direction is not, with our present information, any easier to explain than why variations should appear at all. In the last analysis this must be referred to the unstable structure of protoplasm, though this is obviously a restatement, rather than a solution, of the problem. It is certain that orthogenesis sometimes occurs, and this fact should be kept in mind in any discussion of evolution. See EDUCATION IN THE UNITED STATES; SCOPE'S TRIAL.

EWING (ŭ'ing), JAMES CARUTHERS RHEA, American missionary, died August 20. He was born in Rural Valley, Armstrong County, Pa., June 23, 1854, and graduated from Washington and Jefferson College with the degree of B.A. in 1876, studying later at the Western Theological Seminary, Pa. Graduated in 1879, he entered the Presbyterian Ministry, went to India as a missionary, and in 1884 became a Professor of theology; in 1888 he was made President of the Forman Christian College, Lahore, India; in 1918, Secretary of the India Council of the Presbyterian Church, U. S. A. From 1890 to 1907 he was Dean of the Faculty of Arts in the University of Punjab, and 1910-17, its Vice-Chancellor. He received from Edward VII the Kaiser-i-Hind Gold Medal in 1907, and by George V in 1915 was made C.I.E., and Knight Commander of the Indian Empire in 1923. He was

the author of many books in the Indian tongues and of magazine articles.

EXCAVATIONS. See ARCHÆOLOGY.

EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

EXPLORATION. While exploration continued to be pursued along economical lines to a great extent, there had developed within the past few years an extraordinary activity in archaeological researches, not only in Asia and Africa but in America. Most notable economically have been the French expeditions to ascertain and develop the resources of Northern Africa. As usual the largest number of expeditions have been American. These were so numerous that space permits only a notation of the supporting institution, the name of the leader, line and place of research. Brief summary of the important work done by Andrews in Mongolia and of Morley in Yucatan follows. Andrews, under the American Museum of Natural History, with cooperating institutions, in his third year of work, successfully pursued his researches, despite disturbed conditions owing to civil war. Among the most remarkable discoveries were primitive mammal skulls of the Reptilian Age, petrified redwoods of the Oligocene period, flint tools of the Paleolithic age, and the largest land mammal of all time. Morley, under the Carnegie Institution of Washington, continued his investigations of the remarkable prehistoric city of Chichen Itza, in Yucatan. Dedicatory inscriptions indicate that various buildings were constructed between 965 and 1280 A.D., the Maya structures being in places superimposed on ruins of earlier date. The largest building, the Temple of the Warriors, was found to be decorated with Mayan frescoes of intricate design in brilliant colors, genre subjects, marine views, processions of warriors, through which were interwoven the omnipresent symbolic feathered serpent. The highly developed scientific qualities of the Maya were shown in lines of astronomy, architecture and painting. See ARCHÆOLOGY.

AMERICAN EXPLORATIONS. The large number of such expeditions makes it impracticable to do more than name the institution, the leader, line of research and locality of work. Occasionally a line of description follows.

CALIFORNIA. *California Academy of Sciences.* Hanna; fauna, flora, fish, fossils, Revillagigedo Islands, west of Mexico.

ILLINOIS. *Field Museum* (Chicago). Aided the Andrews expedition in Mongolia. Coöperated with Oxford University, under Langdon, excavating, at Kish, palace of Summerian kings, prior to 3000 B.C. Independent expeditions by Museum were:

Friesser and Holling, zoölogy, British Columbia; Mine, ornithology, Saskatchewan; Heller, zoölogy, Belgian Congo; Linton, anthropology and archæology, Madagascar; Pennell, botany, Chile and Peru; Persaud, botany, British Guiana; Riggs, geology and paleontology, Patagonia; Roosevelt, mammals and birds, uplands near Tibet; Walters, reptiles, Florida and Georgia; Weberbauer, botany, Peru.

Chicago University. Breasted, archæology, Palestine.

KANSAS. *University of Kansas.* Martin, prehistoric fossils, Kansas.

LOUISIANA. *Tulane University.* Gates, tropical plants, Honduras; Haskell, agronomic plants,

Tobasco; Blom and La Farge, Maya ruins, Vera Cruz Lake, Mexico.

**MICHIGAN.** *University of Michigan*, Kelsey, archaeology, North Africa.

**NEW YORK.** *American Museum of Natural History*. President Osborn and Curator Mathew directed the expeditions in Asia and the United States. Andrews (with 14 assistants), general sciences, Mongolia. See above. Beck, ornithology, Fiji Islands; Clark, fauna, Cassier Mountains, British Columbia; Frick, paleontology, New Mexico; Griscom, ornithology, Panama; Mook, paleontology, Montana; Goddard and Schmidt, archaeology, La Ciudad, Arizona; Kidder, paleontology, Canyon del Muerta; Murphy and Heilner, ornithology, Ecuador; Tate, mammals, northern Venezuela; Thomson, paleontology, Wyoming; Vernay, mammals, Angola, West Africa; Watkins, ornithology, Andes and Peru. *Columbia University*. See Prorok under Africa.

*Museum of American Indians*. Cadzow, archaeology and ethnology, Manitoba and Saskatchewan; Gilmore, ethnology, Nebraska and North Dakota; Harrington, archaeology, Nevada; Lothrop, archaeology and ethnology, Guatemala; Speck, archaeology and ethnology, Canada and Greenland; Verrill, ethnology, Panama; Wildshut, ethnology, Idaho and Montana.

*New York Botanical Garden*. Britton, botany, Porto Rico and Virgin Islands; Murrill, botany, Brazil; Small, botany, Florida and Texas.

*New York Zoological Society*. Beebe, marine researches, Sargasso Sea, Atlantic, and Humboldt current, Pacific.

**OHIO.** *Columbus Museum*. Excavated near Bainbridge, Ohio, the Seip mound, finding skeletons, etc., 1000 years old.

**PENNSYLVANIA.** *University Museum* (Philadelphia). Coöperating with British Museum, under Le Grain and Wooley, continued excavations at Ur.

*University of Pennsylvania Museum*. Rove, excavations, House of Ashtaroth, Reisan, Palestine.

**WASHINGTON CITY.** *Department of Agriculture*. Dorsett, agriculture, Manchuria.

*National Geographic Society*. MacMillan (See POLAR RESEARCH); Cummings, archaeology, Cuicuilco, Mexico; Judd (fifth year), archaeology, Chaco Canyon, New Mexico.

*Smithsonian Institution*. Baer, anthropology, Darien; Bishop, archaeology, China. In coöperation with Freer Gallery and Boston Museum of Fine Arts; Fowke, Indian mounds, Alabama; Graham, zoölogy, West China; Standley, botany, Costa Rica and Panama; Walcott, continued geological research in Canadian Rockies.

**AFRICA.** The most extensive explorations in North Africa were made by the French official and commercial parties striving to ascertain local resources, and to bring the natives into intimate and harmonious relations. The Sahara had been made an automobile highway, and its larger occupation had increased its commercial importance. Among many leaders were Brull, Bettembourg, Citroen, and Duverne. Delingette distinguished himself by traversing Africa from the Mediterranean to Capetown. The French archaeological researches at Carthage, Utica, and the Hoggar were continued with valuable results under Prorok, efficiently aided by Kelsey,

University of Michigan; Woodbridge and O'Neill, Columbia University; French, Massachusetts Institute of Technology; Shorey, McGill University; and Wells, University of Virginia.

The British School of Egypt excavated prehistoric remains at Qua, near Assini. Danish Olufsen pursued botanical collections in the Hoggar, and the Swede Moberg devoted his work in that region to ethnology.

**ASIA.** Apart from the remarkable discoveries of Andrews (See *American Explorations, New York*), the most extensive and important researches were those made by the Soviet Government, largely under Schokalsky, Academy of Sciences and Russian Geographical Society, Leningrad. Personally Schokalsky led in 1924 and 1925 the oceanographical expeditions for researches in the Black Sea, making discoveries of scientific and economic value. Other Soviet expeditions were as follows: Gorodkoff found an unknown race, called woodmen by the Samoyedians; Kosloff excavated in the Gobi desert a prehistoric city, with a library of 2500 volumes in 7 languages; Pisariw discovered an extensive magnetic field near Kursk, Siberia; Vladimiroff explored Mongolia in geology and archaeology; Zusser unearthed near Odessa artistic remains of 500 B.C.

The English Kingdon-Ward expedition explored the watershed of the Tsangpo and adjacent unknown regions. The Stockholm Geographical Society continued its survey of the fauna, flora, etc., of Kamchatka. See above: *American Explorations, Illinois, New York, Pennsylvania and Washington City*.

**NORTH AMERICA.** *Canada*. The Alpine Club of Canada (aided by the Alpine Clubs of Great Britain and the United States, and by the Royal Geographical Society) made the ascent of Mt. Logan, 19,800 feet elevation. MacCarthy leading the party reached the summit June 23, 1925. Ascent commenced in May was made in temperatures as low as 32° below zero. The party was 44 days without fire, and passed 5 days above 18,000 feet. The Geological Survey made researches of fossils under Sternberg in Alberta, while Weeks studied the geology of Baffin and Ellesmere Lands. Malone crossed Labrador and discovered the source of George river.

**CENTRAL AMERICA.** See *American Explorations*.

**MEXICO.** See *American Explorations*.

**UNITED STATES.** See *American Explorations*.

**SOUTH AMERICA.** Extensive unexplored areas of the enormous watershed of the Amazon still attract energetic travelers. In his seventh voyage, Rice, after exploring the Negro and Branco rivers, succeeded in reaching the source of the Parrima which he found to be separate from that of the Orinoco. Besides making the first ascent of Mt. Turumiqui, over 9000 feet above the sea, Tate made large collections of the fauna of north-eastern Venezuela, including more than 400 mammals. Dyott in the upper Amazon climbed Mt. Sangar and visited the head-shrinking Indians. MacGovern from the Amazon valley explored unknown regions of Colombia, via Rio Utaupas. Fawcett devoted himself to archaeology and ethnology of remote portions of the continent. The *Museum of Natural History*, of Argentina, in its paleontological researches in Buenos Ayres Province, excavated fossils of human skeletons, antediluvian monsters, etc. See above *American Explorations, Illinois and New York*.

OCEANICA, ETC. The Bishop Museum of Honolulu made researches of the stone pyramids and sacrificial altars of the primitive Polynesians. Douglas, Scientific Expeditionary Association, explored the fauna, flora, etc., of the Marquesas, North Tuamotu and other adjacent islands. Norden investigated the natural history of the Solomon and other near islands. The combined Scientific Societies of Holland, began a botanical and palæontological survey of Java and Sumatra. The University of Zurich in its study of the fauna and flora of New Caledonia discovered plants hitherto unknown. Wilkins, British Museum, explored portions of northern Australia. See *American Explorations, California*.

**EXPOSITIONS.** No great international exposition was held during 1925, but early in the year there was a renewal of interest in the proposed sesquicentennial celebration of the signing of the Declaration of Independence by holding an important international exposition in Philadelphia, Pa., from June 1 to December, 1926. See *YEAR BOOKS* for 1921 (p. 217), 1922 (p. 227), 1923 (p. 222), and 1924 (p. 229). At the close of 1924 the interest in the proposed celebration had waned to almost the vanishing point, but on Feb. 4, 1925, David C. Collier of San Diego, Calif., was appointed director-general and requested to prepare a programme for an exposition. This resulted in a report in which it was shown that in consequence of a special message sent on February 14 by President Coolidge, a bill was passed by Congress providing for the establishment "of a Commission to be known as the National Sesquicentennial Exhibition Commission, and to be composed of the Secretary of State and the Secretary of Commerce, to represent the United States in connection with the holding of an international exposition in the City of Philadelphia."

The scope of the exposition was defined in Mr. Collier's report as serving to "demonstrate in graphic manner the progress made in the United States during the past fifty years in education, art, science and industry, in trade and commerce, and in the development of the products of the air, the soil, the mine, the forest and the seas, and it is the aim and desire that the people of all other nations be invited to contribute evidences of their own progress, to the end that better international understanding and more intimate commercial relationships be engendered and so hasten the coming of universal peace."

A site comprising the whole of League Island Park, 200 acres in extent on the Delaware River in South Philadelphia, and about 400 acres additional were selected on which to construct the exposition buildings, and should it become necessary to acquire more space, provision was made for its acquisition in adjacent property. Arrangements were made for the construction of a series of pavilions to be known as Agricultural Hall, Food Products Hall, Horticultural Hall, Machinery Hall, Manufacturers Hall, Mineralogical Hall, Motor-Industries Hall, Transportation Hall and a Palace of Industry. So far as possible efforts were to be made to construct these buildings on the lines of the American Colonial type of architecture. Also provision was made for State buildings, buildings of foreign governments, and other special buildings, such as a replica of Sulgrave Manor, the ancestral home of George Washington which the Colonial Dames of America were arranging to reproduce. A large

stadium for athletic sports and other entertainments was to be erected and an amusement section, to be called the "Glad Way" has been provided for.

In addition to the buildings within the grounds, the municipality of Philadelphia had undertaken the construction of a new Art Museum on the Parkway, near the entrance to Fairmount Park, a new Public Library, and the enlargement of the Commercial Museum. It was estimated that the cost of the exposition will be approximately \$5,000,000 and a bill was passed by Congress authorizing the coinage of commemorative \$2.50 gold pieces and of half-dollar silver pieces.

In October a popular subscription increased the fund by \$3,000,000 and it was intended to use this amount for the erection of the exhibition buildings as previously planned. These it was found would cost more than \$12,000,000, and at a meeting of the exposition officials the programme, at the suggestion of Mayor Kendrick, was cut "from seven buildings to cost \$12,000,000 to two exhibition buildings and an auditorium at a total cost of \$3,000,000." In consequence of this action Director General Collier resigned, consenting however to remain with the organization in an advisory capacity until December. On November 24, Captain Asher C. Baker was chosen director-in-chief. The City Council of Philadelphia commended the mayor's stand for "a dignified and economical celebration of the birth of the Nation." Notwithstanding the shortness of the time it was officially announced that the exposition "will be opened on time" by President Coolidge who had promised to be present.

**SECOND WEMBLY EXPOSITION.** Notwithstanding the official announcement last year (*YEAR BOOK* for 1924, p. 229) that the exhibition at Wembley would not be reopened, nevertheless in response to persistent demand the second British Empire Exhibition under the chairmanship of the Duke of York was opened on May 9 by King George in company with Queen Mary and Prince Henry. In addition to the regular exhibits from various parts of the British Empire, a special feature of this year's exhibition was the woman's section, and under the presidency of the Duchess of York, many functions, including a National Baby Week, were held.

Unfortunately towards the close of 1925 the announcement was made that the second year of the British Empire Exhibition at Wembley, which, it was hoped, would make good the heavy loss in the first year, had failed to do so. Its calculated deficit was about £1,500,000, which would be reduced somewhat by the salvage in buildings and other material. The state guarantee was £1,000,000, and privately the exhibition was backed for about £1,200,000, hundreds of individuals having set their names to small guarantees as low as £10. The attendance was over 9,500,000 as against 17,403,267 last year.

**INTERNATIONAL EXPOSITION OF DECORATIVE ARTS AND MODERN INDUSTRIES.** This exposition of unusual interest was held in Paris from April to October. See *ARCHITECTURE*. The site chosen comprising 57 acres, was on the two banks of the Seine between the Champs Elysées and the Hôtel des Invalides. Exhibits of all industries that presented a character of art and of strict modern tendency were shown, but no copy or imitation of an ancient style was ad-

mitted. These exhibits were distributed among five groups as follows: 1. Architecture, 2. Furniture, 3. Wearing apparel, 4. Theatrical, Street and Garden Architecture and Decoration; and 5. Education. These groups were again subdivided into classes of which there were 30. In addition to general pavilions in which there were classified exhibits, various nations had special buildings, such as Austria, Cuba, and Japan, and also many cities of France, as Limoges, Marseilles, and Paris. There was no official representation from the United States. Gardens with plants and flowers were on the grounds to beautify the scene and refresh the visitor. A series of commemorative postage stamps was issued by the French Government in honor of the Exposition.

At a meeting of the World's Fair and Maritime Exposition Commission, appointed by the Georgia General Assembly in 1922, a definite programme for the furtherance of the two exhibitions at Savannah, Ga., was mapped out. It was decided to have separate anniversary celebrations, the maritime exposition, which proposed to commemorate the birth of steam navigation at Savannah, to be staged from October, 1926, to October, 1927; while the proposed world fair is scheduled for 1932, and will likewise commemorate the founding of the first Georgia colony at the port city.

The possibility of a world exhibition in Sydney, Australia, in 1930 to celebrate the opening of the Sydney Harbor Bridge was agitated early in 1925 in that city. It was pointed out that in 1930 the British aerial route between England and Australia would be established, and that several important buildings of the Federal capital at Canberra would also be opened. Allied with the exhibition would be the holding of an international radio congress, while the holding of an international sport carnival on a scale commensurate with the Olympic games would be arranged. Meetings were held in Melbourne, Adelaide, and other state capitals, so that a plan could be drawn up for consideration by the Federal Government.

The usual sample fair was held in Lyons, France, during March 2-15, and a *Buyer's Handbook* in English was issued this year for the benefit of visitors from English-speaking countries. The autumnal Leipzig fair, which ran from August 31 to September 6, 1924, was a financial loss, due largely to the general shortage of credit and cash in Germany, and the high prices prevailing in most lines of business. The spring fair in March, 1925, had a record number of exhibits amounting to 15,000, and an attendance of more than 150,000 but the business was reported as "poor." The autumnal fair was held during August 30-September 9. One of the features of this fair was a huge underground exhibition hall, considered a technical world's wonder. Another prominent feature was the machinery hall, conceded to be the largest exhibition hall in Germany. It occupied an area of 21,000 square meters. The former house for electrotechnics was materially enlarged by two wings, each two stories high. In order to furnish the necessary space for the erection of a number of new exhibition buildings, the municipality of Leipzig placed a further area of 130,000 square meters at the disposal of the administrators of the fair, permitting a sufficient space for the construction of a special freight

station. The attendance was very large and more than 130 special trains full of visitors arrived on September 1. "America Day" was celebrated on September 3 when Ambassador Schurman arrived from Berlin by airplane and delivered an address at the banquet given in his honor.

**FAILURES.** See FINANCIAL REVIEW.

**FAIRS, INTERNATIONAL.** See EXPOSITIONS.

**FALKLAND ISLANDS.** A British crown colony situated in the south Atlantic, 300 miles east of Magellan's Strait, consisting of: East Falkland, 2508 square miles; West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia with an estimated area of 1000 square miles, and other dependencies including the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land, together with all unknown seas and lands of the region of the Antarctic Ocean extending as far as the South Pole. The estimated population in 1922 was 2140. In 1923 the birth rate was 16.3 per thousand; the death rate, 8 per thousand. The chief town is Stanley with 890 inhabitants in 1921. Education is compulsory. The chief industry is sheep raising, although whaling is carried on with some success. In 1923 the imports were £424,712; the exports, £3,086,819. The chief exports were wool and whale produce; the chief imports, coal and coke, provisions, and machinery. The revenue in 1923 was £190,337 and the expenditure £45,304. The chief item of revenue was the customs duties. Governor at the beginning of 1925, Sir J. Middleton.

**FALL, LEO.** An Austrian composer, died in Vienna, September 16. He was born at Olmütz, Feb. 2, 1873. After training from his father, a bandmaster, he studied at the Vienna Conservatory. For some years he was operatic conductor at Berlin, Hamburg, and Cologne. His first opera, *Frau Danise*, was produced in Berlin, in 1902, but made little impression. A second opera, *Irrlicht* (Mannheim, 1905), and his first operetta, *Der Rebell* (Vienna, 1905), did not fare much better. But the latter, in a new version as *Der liebe Augustin* (Vienna, 1911), later had enormous success. In 1907 two operettas were brought out in Vienna, *Der fidele Bauer* (July 5) and *Die Dollarprinzessin* (Nov. 2), which immediately made their way to all theatres of Austria and Germany, and placed the composer in the front rank of the masters of sparkling comedy. From then on until the outbreak of the War every year witnessed the production of a new work, each winning instant favor. A third serious opera, *Der goldene Vogel* (Dresden, 1920) proved a comparative failure. His last great success was *Madame Pompadour* (Berlin, 1922). In the fall of 1924 he visited the United States and witnessed its American premiere. In this country he is best known through his *Dollar Princess* (New York, 1909) and *The Girl in the Train* (New York, 1910), the latter being the English title of *Die geschiedene Frau* (Vienna, 1908).

**FARABEE, WILLIAM CURTIS.** American anthropologist and explorer, died June 24. He was born at Washington, Pa., Feb. 7, 1865, and after studying at the California, Pa., State Normal School entered Waynesburg College, Pa., from which he was graduated in 1894. After teaching in Pennsylvania schools he became principal of

Jackson Academy, Jackson Centre, Pa. In 1901 he became Austin teaching fellow, at Harvard University and 1903-13 was instructor in anthropology. In 1913 he became curator of the Museum of the University of Pennsylvania in charge of various explorations, among others the University of Pennsylvania South American Expedition. He was a member of many scientific societies and was ethnographer to the American Commission to Negotiate Peace in Paris, 1918-19. He served on a diplomatic mission to Peru where he was made a member of the Ancient Order of El Sol. He wrote extensively on anthropological subjects.

**FAR EASTERN REPUBLIC.** An independent state formed after the war out of the former Russian provinces of Transbaikai, Amur, the Maritime Provinces, and the northern part of the island of Sakhalin. After Nov. 19, 1922, the Far Eastern Republic became a constituent part of the Russian Socialist Federal Soviet Republic. Area, 652,740 square miles; population (1922) about 2,000,000. Chita is the seat of the government. See RUSSIA.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.**

An organization including most of the Protestant denominations of the United States. It was established in 1908 by 28 Protestant denominations, to act for them in matters of common interest. It numbered, at the close of 1925, the following constituent bodies: Baptist Churches, North; National Baptist Convention; Free Baptist Churches; Christian Church; Churches of God in North America (General Eldership); Congregational Churches; Disciples of Christ; Friends; Evangelical Church; Evangelical Synod of North America; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Primitive Methodist Church; National Council of the Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; Seventh-Day Baptist Churches; United Brethren Church; United Presbyterian Church; United Lutheran Church (Consultative Body). Of these denominations, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose connection is through its National Council. The total number of local churches included in the constituency of the Federal Council in 1924 was 142,227; number of clergymen, 117,519; total communicant membership, 20,942,033. The Council, made up of members designated by the several denominations to act for them, meets quadrennially. It has an executive committee of approximately

100, which holds an annual business meeting.

A meeting of the whole Council was held in Atlanta, Dec. 3-9, 1924. The Executive Committee met in Detroit, Mich., Dec. 9-11, 1925. An administrative committee, including one official representative from each of the denominations, meets monthly in New York. This committee includes representatives of other co-operative agencies carrying on specialized work for the churches, among these the Home Missions Council, the Council of Women for Home Missions; the Council of Church Boards of Education, the American Bible Society, the Student Volunteer Movement of Foreign Missions, and the International Sunday School Council of Religious Education. The Council also serves as a connecting link between the church and great social agencies, such as the American Red Cross, the Child Welfare Movement, United States Department of Health.

Special tasks of the Council are carried on by a group of commissions, all under its oversight. The more important of these commissions in 1925 were: the Commission on Evangelism, which develops a united approach to evangelistic work of the churches. The Commission on the Church and Social Service is the centre through which the churches deal unitedly with social issues. Particular attention is given to the developing of better relations in industry through conferences. A Department of Research and Education issues a weekly information service discussing contemporary social questions from the standpoint of Christianity and makes special studies from time to time. Its outstanding study in 1925 was a *Report on the Prohibition Situation*. The Commission on Church and Race Relations furthers efforts of churches in promoting coöperation and good will between the white and negro races in this country. The Commission on International Justice and Good Will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation.

During 1925 there was carried on an educational campaign through the churches for the entrance of the United States into the Permanent Court of International Justice and for the outlawry of war. Attention was given to developing better relations with the Orient. The Commission on Councils of Churches organizes the churches of local communities for coöperative action in their own areas. Other Commissions of the Council deal with the following subjects: Christian Education; Relations with Religious Bodies in Europe; Religious Work in the Canal Zone; Army and Navy Chaplains; Relations with the Eastern Churches. The programme of the Council is carried on with funds contributed in part by individuals interested in the work and in part by appropriations from the various denominations. National offices are at 105 East 22d Street, New York. There is a Washington office in the Woodward Building, and a Western office at 19 South La Salle Street, Chicago. The official organ of the Council is the *Federal Council Bulletin*, issued bi-monthly and furnishing general religious news. The officers, 1924-1928, are: President, Rev. S. Parkes Cadman of Brooklyn; Chairman of Executive Committee, Bishop John M. Moore of Dallas; Chairman of Washington Committee, Bishop William F. McDowell; Chairman of Western Committee, Dean Shailer Mathews. General Secretaries at the

national offices are Rev. Charles S. Macfarland and Rev. Samuel McCrea Cavert.

**FEDERAL TERRITORY.** A territory of the Commonwealth of Australia, lying within the state of New South Wales. Area, 940 square miles; population, according to the census of 1921, 2572, estimated Mar. 31, 1924, 3677. The bulk of the territory was acquired by the Commonwealth from New South Wales in 1911, as the site of the new capital, Canberra; 28 miles was obtained in 1917 as the site for a naval college.

**FEDERATED MALAY STATES.** A group of states, constituting a large part of the Malay Peninsula, under the protection of Great Britain, comprising: Perak, with an area of 7800 square miles; population in 1921, 599,055; capital, Taiping; Selangor, 3156 square miles; population, 1921, 401,009; capital, Kuala Lumpur, the largest city in the Federation, population, about 80,000; Negri Sembilan, 2550 square miles; population, 1921, 178,762; capital, Seremban; Pahang, 14,000 square miles; population, 1921, 146,064; capital Kuala Lipis. The total area is 27,506 square miles; with a population in 1921, of 1,324,890, comprising 510,821 Malays, 494,548 Chinese, 305,214 natives of India, 5686 Europeans, and 3204 Eurasians. The males greatly outnumber the females (853,528 to 471,362), which is due to the number of Chinese and Indian immigrants. The movement of population in 1923 was: Births, 35,653; deaths, 33,914. The English schools in 1923 numbered 44, with an average enrollment of 9252 boys and 2267 girls. Vernacular schools under the control of the education department numbered 583 with an average enrollment of 30,753. There are many Chinese vernacular schools not maintained by the government.

The chief products are: Rice, cocoanuts, rubber, sugar, tapioca, pepper, gambier, and nipah palms. The main industries are the raising of rubber and the mining of tin. In addition to valuable timbers, the forests produce resins, canes, gutta percha, etc. Besides tin, gold is mined extensively; other minerals found but not worked in quantities are: Lead, iron, copper, manganese, silver, zinc, plumbago, mercury, arsenic, and scheelite. In 1923, 37,650 tons of tin were exported and in 1924, 44,042 tons. The total number of workmen engaged in the mining industry at the end of 1923 was 96,662. The trade of the various states in 1923 was as follows: Perak, imports, £3,853,899; exports, £10,682,829; Selangor, imports, £5,233,895; exports, £8,661,082; Negri Sembilan, imports, £856,554; exports, £2,773,230; Pahang, imports, £415,867; exports, £837,575; total, imports, £10,360,215; exports, £22,954,716. Chief imports, rice, opium, tobacco, cigars and cigarettes, cotton piece goods, sugar, milk, live animals, spirits, petroleum, ironware and machinery; chief exports, Para rubber, copra, tin and tin ore, timber, and hides. For a detailed account of the 1923 trade (the latest available statistics) see preceding YEAR BOOK.

In 1923 the revenue of the states was £7,360,780 and the expenditure, £6,162,983. The chief items of the revenue were: Railways, licenses, customs, fees, land, forests, posts and telegraphs; expenditure, police, medical, education, posts and telegraphs, public works, debt, and pensions. The public debt on Dec. 31, 1923, was

£11,105,000. The total mileage of railways open for traffic in 1923 was 1044 and about 63 miles were under construction. No later figures on shipping are available than those given in the preceding YEAR BOOK. The states are under British protection and the British government is represented by the governor of the Straits Settlements who is *ex officio* high commissioner for the Federated Malay States. High Commissioner at the beginning of 1925, Sir Lawrence Nunns Guillemard.

**FEDERATION OF LABOR, AMERICAN.** See LABOR, AMERICAN FEDERATION OF.

**FENCING.** The Fencers' Club of New York City with four national team championships to its credit proved the preëminent fencing organization of the United States in 1925. The individual foils title went to Lieut. George C. Calnan, U. S. N., and Fencers' Club, while the individual honors in the épée competition were won by W. H. Russell also of the Fencers' Club. Joseph Vince of the New York Athletic Club captured the individual sabres championship. Mrs. L. M. Schoonmaker of the Fencers' Club won the women's foils title, second and third places going to other members of the same organization. Yale University was the victor in two of the team competitions for the intercollegiate championships, winning with the sabre and the épée. The team foils laurels fell to the United States Naval Academy. The individual intercollegiate titles were distributed as follows: foils, Stubbs of the U. S. Naval Academy; sabre, Wolf of Yale University, épée, Applebaum of the University of Pennsylvania.

**FERTILIZERS.** Improved agricultural conditions in 1925 were reflected in increased as well as more discriminating use of fertilizers. Such figures as were obtainable at the close of 1925 indicated a fertilizer consumption in the United States well over 8,000,000 tons, probably at least a million tons greater than in 1924. Some decrease in consumption earlier in the year due to unprecedented drought, especially in the southeastern States, which are among the largest users of fertilizers, was apparently compensated for by increased use later in the year. Notwithstanding a steady increase in recent years, however, consumption of fertilizers has not yet reached the normal pre-war level, either in this country or in the world at large.

Both exports and imports of fertilizing materials increased during the 10 months ended Oct. 31, 1925, over those of a like period during 1924, exports being 955,787 tons valued at \$14,419,789 in 1925, as compared with 898,518 tons valued at \$13,901,082 in 1924, and imports 1,942,492 tons valued at \$67,670,275 in 1925, as against 1,498,425 tons valued at \$55,272,626 in 1924.

The largest increases in exports were of rock phosphate and acid phosphate; in imports, of nitrogenous fertilizers, notably sulphate of ammonia, nitrate of soda, and synthetic nitrogen compounds, and of potash salts. The United States exported 727,326 tons of rock phosphate valued at \$4,790,788 during the first 10 months of 1925. This represented a distinct increase over exports for the same period in 1924. Imports of phosphatic materials decreased, being 29,132 tons, mostly bones, valued at \$690,388. Complete statistics of production of rock phosphate are not available, but no falling off is

indicated. Shipments of Tennessee rock phosphate were reported to have increased 25 per cent during the first nine months of the year as compared with those of a like period in 1924. It was also reported that the mining of phosphate in Algeria and Morocco had become so active as to cause alarm to the Tunisian phosphate interests and to lead to efforts to form a combination to limit output and control prices.

Production of acid phosphate in the United States was 1,800,226 tons during the first half of 1925, an increase of 13.6 per cent as compared with the exports of the first half of 1924. Exports notably increased, amounting during the first 10 months of 1925 to 60,863 tons valued at \$922,503. Progress in perfecting substitutes for the acid process of making acid phosphate was reported. An electrical volatilization process was in successful operation at Anniston, Ala. The Bureau of Soils of the United States Department of Agriculture made further experiments with fuel-fired furnaces for the volatilization of phosphoric acid and found that good results could be obtained with a temperature as low as 1200° C.

The exports of nitrogenous fertilizers from the United States during the first 10 months of 1925 amounted to 106,563 tons valued at \$5,867,356 and consisted mainly of 100,980 tons of sulphate of ammonia valued at \$5,540,325. Imports amounted to 1,201,714 tons valued at \$55,514,631 and consisted mainly of 995,316 tons of nitrate of soda valued at \$47,124,782 and 75,577 tons of calcium cyanamide valued at \$3,626,581. A decrease in exports and an increase in imports of sulphate of ammonia and marked increases in imports of nitrate of soda and calcium cyanamide during the year are indicated.

The estimated Chilean output of nitrate of soda during 1925 was 2,600,000 metric tons, with exports exceeding 2,000,000 tons. The estimated world production of synthetic nitrogen compounds was 550,000 tons, 65 per cent of which was produced by the synthetic ammonia process.

The maintenance of an adequate supply of nitrogen compounds for fertilizer purposes is a matter of world-wide concern. The extent to which this need can be met by sulphate of ammonia from blast furnaces, coke ovens, and like sources has been carefully investigated, and the limitations of this source of supply are well understood. Synthetic sulphate is now appearing on the market in considerable quantity from German sources and promises to become a factor of commercial and agricultural importance. Much attention has recently been given to the best means of using sulphate of ammonia as a fertilizer, with the result of showing the possibility of greatly extending the beneficial use in agriculture of this important industrial product.

With improved methods of mining and refining there appears to be no imminent danger of the exhaustion of the Chilean nitrate supply. However, while the cost of production was reported to have increased only 20 per cent, the price had risen 50 to 75 per cent. Inquiry into monopolistic control of the price of nitrate was instituted by Congress at the close of the year. An event of importance in this connection was the organization early in the year of the Anglo-Chilean Consolidated Nitrate Corporation, which it was expected would handle a considerable por-

portion of the total nitrate export of Chile and would install improved methods.

Fixation of atmosphere nitrogen for fertilizer and other purposes continues to make rapid progress, about one-half of the world's supply of nitrogen compounds now probably coming from this source, about three-fourths of it being made in Germany largely by the Haber process. An improvement of the Haber synthetic ammonia process, devised by the Fixed Nitrogen Laboratory of the Department of Agriculture, was put into successful operation during the year by a commercial plant having a capacity of 3 tons of ammonia per day. A modification of the Haber process was also in use in England. Czecho-Slovakia increased by 30,000 tons annually its capacity to manufacture synthetic nitrogen compounds.

The disposition to be made of the Muscle Shoals project was still unsettled at the end of the year. Sharp differences of opinion existed as to choice between Government ownership and operation and private management, and as to use for manufacture of fertilizers or for power purposes. The use for the former purpose was strongly opposed by the fertilizer industry. The President in his annual message to Congress in December recommended that Congress arrange, through a special commission, to sell the plant to the highest bidder who will agree to develop and use it "for the production of nitrate primarily and incidentally for power purposes."

For its supply of potash the world is now practically dependent upon the German and French mines. Production elsewhere is relatively unimportant, although possibilities of developing other sources of supply as, for example, in Spain and in Texas are not inconsiderable, and the U. S. Bureau of Soils reports that a process of extracting potash from greensand devised by the bureau is now in successful commercial operation at Odessa, Del.

The price of potash for export to America was fixed by German-French agreement early in the year at \$31.10 per ton, which is lower than the price either during the pre-war period or immediately following the war—the only fertilizer ingredient of which this is true. There was a marked increase of imports of potash salts into the United States during the first 10 months of 1925, amounting to 677,781 tons valued at \$10,664,799 as compared with 427,646 tons valued at \$7,349,365 during the same period in 1924.

The production of the Alsatian mines, which was greatly hampered by labor troubles during 1924, amounted to nearly one-half million tons of crude salts, equivalent to about 125,000 tons of pure potash during the first five months of 1925.

Interest in the use of more concentrated fertilizers and incidentally in the reduction of the multiplicity of brand names continued. The latter question is now under consideration by the National Fertilizer Association coöperating with the U. S. Department of Commerce. There appears to have been some increase in the use of high-grade mixed fertilizers, although a study of the composition of mixed fertilizers sold in New Jersey in 1915 and in 1925 showed on the average a considerable increase only in the case of potash, a slight increase in the case of nitrogen, and a slight decrease in the case of phos-

phoric acid during the ten-year period. Concentrated fertilizer materials, however, were appearing on the market in increasing quantity and appeared certain to play an influential part in the fertilizer industry and in practice, because of the saving in cost of transportation and handling. Difficulties in mixing, conditioning, and distribution of the concentrated products were being studied with good promise of finding methods and appliances which would overcome them. Processes for the simultaneous manufacture of such concentrated products as ammonium phosphate and potassium phosphate, worked out by the U. S. Department of Agriculture, were tested successfully on a semicommercial scale. A process also was devised for preparing nonhygroscopic potassium nitrate, and potassium nitrate is being prepared as a by-product of the refining of Chilean nitrate in sufficient quantity to be of commercial importance.

The diminishing supply of manure has stimulated interest in the preparation of artificial substitutes for it. Considerable progress was made, especially in England, in the manufacture of such a substitute by the Rothamsted process, or modifications of it, which converts straw and other waste materials into a manure-like substance. By this process it was claimed to be possible to convert 1 ton of straw into 3 to 4 tons of rotted material, having much the appearance, composition, and fertilizing effect of manure, at a cost of about \$2 per ton of the finished product.

A significant event of the year was the formation of the National Fertilizer Association by combination of two previously existing organizations.

**FJI ISLANDS.** A colony of the British crown, comprising a group of islands in the South Pacific about 250 in number (some 80 uninhabitable). Area, 7083 square miles; population, according to the census of 1921, 157,266, of whom 84,475 were Fijians, 60,634 Indians, and 3878 Europeans. The largest island is Viti Levu (4053 square miles) and the next Vanua Levu (2130 square miles). The capital, Suva, on the south coast of Viti Levu, had a European population (including suburbs) of 1741. Cocoanuts, sugar cane, rice, tobacco, tea, tropical fruits, beans, sisal, and hemp are the principal products. Horses, mules, cattle, sheep, goats, and pigs are raised. During 1924 the islands imported goods valued at £1,066,574, or an increase of £77,514 as compared with the preceding year, while exports dropped £54,305 to £1,498,934 over the same period. Exports of sugar and molasses decreased in value during 1924, but bananas, rubber, and copra registered increases. The quantity of copra exported during 1924 was less than in the previous year, but owing to increased prices the value was greater. The reverse was true of sugar, however, which was exported in greater volume but brought lower prices. The revenue for 1923 was £479,982 and the expenditure £429,665. The public debt at the beginning of 1924 was £358,000.

The total tonnage entered and cleared in 1923 389,969 of which 355,485 was British. A privately owned small gauge railway of 120 miles runs from Tavua to Sigatoka. The executive power is vested in a government appointed by the crown, aided by an executive council and a legislative council of which the governor is president. The governor is also high commissioner for the Western Pacific. Governor in 1925, Sir Eyre Hutson.

**FINANCIAL REVIEW.** The year 1925 was in general a period of uncommonly high productive activity and unusual prosperity and in finance. Three general periods of change may be noted in the course of the year; the first comprising about four months of fairly active and successful business, the second about two months of comparative quiet or "between seasons" condition, while the third, covering the second half of the year, was a period of almost continuous expansion and enlargement of trade. Larger production, greater activity in stock market speculation, expanding foreign trade, greatly increased activity in foreign financing and a variety of other factors combined to make the year one of uncommon significance. Failures were less than for 1924, showing a decrease of 18 per cent in liabilities; while banking was pretty generally sound and satisfactory, although the failure epidemic which had prevailed in the west and northwest during the year 1924 continued to be acute although of a rather lower severity. Conditions in the agricultural regions were uncommonly good, the farmer being prosperous and his demand for commodities strong. Labor troubles were practically negligible during the twelvemonth, with the exception of an anthracite coal strike which, starting in the early autumn, continued throughout the remainder of the year.

**BUSINESS ACTIVITY.** Judged by practically any standards the business year has been one of unusual activity and success. Carloadings were far above average, running between 1,000,000 and 1,100,000 cars per week during a large part of the year. The gross operating revenues of class one roads were in the neighborhood of \$6,186,000,000, thus showing a very satisfactory gain above those for 1924 which were reported as \$5,987,000,000. Net incomes also showed improvement, amounting to \$1,137,000,000 or approximately 15 per cent for the year, an increase over 1924 of \$986,744,000.

In the metal industry conditions on the whole were very favorable. Although the unfilled orders of United States Steel Corporation fell off during the forepart of the year, they showed recovery during November and December, the final statement of orders on December 10th being 5,033,000 tons against 4,617,000 tons a year earlier, an increase for the month over November of about 473,000 tons. Elsewhere in the steel industry there was substantial activity, and at the close of the year the general scale of operations was from 80 to 85 per cent of capacity, United States Steel itself being reported as operating at about 85 per cent. Excellent demand for steel products was felt throughout the year for the automobile industry, while the oil business showed decided recovery during the course of the twelve months with correspondingly large demand for equipment and material.

Although it had been thought that the "build-

ing boom" of the preceding year would not be able to perpetuate itself it continued throughout the season with an unprecedented volume, total building operations aggregating about \$6,300,000,000 or 20 per cent over 1924, with corresponding demand for steel and other materials. General production indexes as reported by the federal reserve banks showed steady growth during the latter part of the year, and it would seem probable that aggregate production for the twelve months was in most lines fully up to the "peak" of post-war production while exceeding it and making a corresponding "record" in not a few lines. Exports of merchandise totaled about \$4,909,396,342 for the year a favorable balance of \$681,401,251, and while values were somewhat increased, as in the preceding year, by higher unit prices for staples, it was also true that very considerable growth made itself apparent in the actual shipments of goods as measured by volume or weight. The following table of production indexes issued at the close of the year shows in a comparative way the situation then existing as contrasted with earlier periods.

BUSINESS INDICATORS  
(Relative numbers—1919 Mo. Ave. = 100)

	Per cent increase (+) or decrease (—)	
	Dec. 1925 from Dec. 1924	Dec. 1925 from Dec. 1924

Business failures:		
Number of firms .....	379	349 - 7.9
Liabilities .....	480	387 - 19.4
* With seasonal adjustment.		

PRICES. The price movement showed an uncommonly stable position relatively during the year, particularly when it is remembered that business was as active and circulation as abundant as was actually the case. The index of wholesale prices issued by the Bureau of Labor Statistics showed an advance from about 156 to 158 at the close of the year while the weekly index published by Prof. Irving Fisher which was approximately 159.4 at the opening of the year and averaged 161.9 for the first quarter, closed at 159.3. For long periods during the twelve months prices were comparatively stable. Greatest variations were found in the agricultural group just as during the preceding year, although agricultural prices for the most part were satisfactory. The agricultural price index of the Bureau of Labor showed in December, 1924, a figure of 156.7 while at the December period for 1925 it was 152.2. On the manufacturing side, conditions were likewise not far from stable, the index for textiles and clothing varying 4.3 points from 191.4 in December, 1924, to 187.1 at the close of the year 1925. Foundry No. 2 pig iron reached a price of \$23 per ton delivered at furnace at the close of 1925 while

No. 2 wheat was \$1.80. Cattle reported at \$17-\$19 per 100 and hogs at \$17-\$17.50 per 100 at the close of the year. Some materials of manufacture showed great variations, conspicuous among them being rubber which partly under the influence of foreign control and partly of domestic demand was at one time as high as \$1.10 per lb.

AGRICULTURAL PRODUCTION. The year opened rather unsatisfactorily with tolerably poor conditions for both winter and spring wheat and the prospect of a rather short crop. (See WHEAT.) Later improvement, however, brought the eventual output up to 271,000,000 bushels of spring and 399,000,000 bushels of winter wheat, an aggregate of 670,000,000 bushels slightly off from the five-year average. Cotton (q.v.) started off somewhat uncertainly although with a somewhat large acreage but weather conditions improved greatly during the latter part of the year and insect infestation turned out to be small. The result was the curtailment of losses due to that cause and an eventual production of probably about 16,000,000 bales as compared with 13,627,000 bales in 1924. The total value of farm products except in livestock was estimated by the government as approximately \$9,615,000,000 about \$400,000,000 below 1924 while wheat was valued at \$590,000,000 and cotton at \$1,628,000,000. Very good cotton crops all over the world tended to reduce the price of cotton which finally closed the year at 19.83¢ for the January option, while wheat had to compete with moderately good crops in other parts of the world and was unable to maintain the very high prices running up to \$2.10 a bushel which had been realized early in the year. The closing figure for the May option was around \$1.80. Favorable conditions tended to help the farmers pay off their bank loans and general financial prospects throughout the farm region were better than for some years. See AGRICULTURE.

BANKING. In banking the year showed a continuation of expansion and satisfactory growth with commercial demand rather heavier than during the preceding year and speculative requirements unprecedentedly large. Taking the country as a whole, banking conditions may be said to have been sound, although the total number of failures was estimated at the close of the year at about 550, some 200 less than during the preceding year, but still a very large number. These failures continued to be found chiefly among the small banks of the West and Middle West, although they existed sporadically in many other places, and toward the close of the year showed a tendency to creep into the cities notwithstanding that they had previously been found largely in rural districts. The banking business as a whole was extremely prosperous, and for national banks the Comptroller reported an average rate of dividends of 12.05 per cent on capital as compared with a fractionally lower rate for 1924. Total deposits at the close of the year were \$19,930,000,000, an increase of \$822,000,000, while capital was \$2,500,000,000 (including surplus). Considerable development of competition between national and State banks and trust companies developed and led to controversial discussion in Congress apropos of legislation designed to bring about a greater equalization of competitive conditions between national and State institutions. According to the Comp-

troller of the Currency a good many national banks transferred to State charters because of the greater opportunities for profit there open.

National banking conditions were as usual of so much interest as to warrant a complete statement, the figures being given herewith for the five regular report dates, the last being for Sept.

banking phase of their activities. Undoubtedly this trend has caused some anxiety to a good many persons, owing to the belief that there was rather too much disposition on the part of the banks to permit a very large portion of their resources to become involved in operations of this "frozen" or semi-frozen description. The

28, 1925. A study of these figures shows the maintenance of national banking operations at a very high level and a substantial growth in business during the year. Significant in the year's history was the increase in the bonds and other securities held and the evident upward tendency of what may be called the investment

figures however speak for themselves and repay analysis. See NATIONAL BANKS.

BRANCH BANKING. No definitely new conditions developed in connection with branch banking during the year. The expansion of the national banks in the field of local branch banking and the growth of branch banking on the part of

State banks were to be noted as features of the period but there was no great alteration of direction or of rate of increase either in State or national systems while the policy of the Comptroller of the Currency and of the Federal Reserve Board on the subject continued substantially unchanged. Although in Congress there was constant agitation of the banking question and effort to pass a bill designed to regulate or control it, the opposition to such a measure proved so strong that nothing could actually be adopted and as a result there was practically a standstill although toward the close of the year legislation was again brought forward in both houses of Congress with a view to discussion.

During the year there was a fair development of stabilization in connection with agricultural paper and farmers' loans in the West. The process of liquidation which had been begun the year before continued and there was considerable adjustment of frozen assets. Nevertheless as already noted, bank failures continued in the agricultural regions and in spite of the higher values of the crops a good many banks which had already become embarrassed found it necessary to go into the hands of receivers.

**FEDERAL RESERVE SYSTEM.** Developments in the Federal Reserve System were of considerable interest during the year. There was a substantial expansion on the part of reserve banks, although nothing very notable, member banks finding themselves well supplied with funds and hence deeming it unnecessary to resort to reserve banks in any considerable numbers for assistance. The striking features of Federal Reserve activity were found not at home but in the foreign field. During the year the reserve banks granted a revolving credit to Great Britain to the amount of \$200,000,000 for the purpose of assisting in the maintenance of the gold standard, return to which had been announced by the British Government in the early spring. The

Reserve banks had previously begun the purchase of German commercial paper under specified conditions. When the Belgian Government funded its war debt to the United States the Reserve banks immediately ordered the purchase of Belgian commercial paper. A change in their statement designed to show the amount of their holdings of foreign obligations was introduced and a considerable commitment was developed in the course of a year. At home the same "open market policy" as before designed to maintain a sufficient amount of paper and investments to carry the very high overhead expenses of the System was continued.

The brief tabulation on the preceding page shows the essential changes in selected member bank, and in reserve bank, statements during the course of the year.

**MONEY RATES.** During 1925 money rates were for the most part decidedly low. Business in general had undergone some increase during the fore part of the year then sagged back, and then took a sharp upward trend again, but in the meantime gold imports had been resumed and the banking policy of Great Britain was such as to drive a good deal of gold toward the United States. As a result of the many complex factors of the situation coupled with the persistently low discount rate policy on the part of reserve banks money rates were maintained at an unduly low level throughout the first three quarters of 1925. Choice commercial paper varied from a high level of about 4¾ per cent for a short time in the month of November to a figure of about 3¼-4 per cent in the months of May and June. Call money was available most of the time at very moderate figures in the neighborhood of 3½ per cent while there was no change in discount rates until the month of November. During all this period reserve banks had maintained a discount rate of either 3½ per cent or 4 per cent but during the last two months of the year those banks which were on a 3½ per cent basis advanced their rates to 4 per cent with the exception of the New York bank which continued to maintain a 3½ per cent figure under a gentlemen's agreement with the Bank of England.

Owing to the very low figures for money and owing also to the enormous growth of speculation the amount of brokers' loans reached a figure at the close of the year amounting to something like \$2,500,000,000. Undoubtedly there was a deliberate maintenance of low money with a view to keeping up what was technically called prosperity. Toward the close of 1925 spare funds of commercial banks had been pretty well absorbed, and the result was to bring about a movement of funds toward higher levels, call money closing the year at six per cent, after maintaining a six per cent level for a good while toward the end of the year. The discussion of money policies continued to be very acute during the year with opinion generally to the effect that rates had been unduly low throughout practically the whole of the twelve months.

**FOREIGN EXCHANGE.** While it was true that in the main foreign currencies showed a more stable and quieter tone than for some time past the year 1925 was certainly not free of annoyance or disturbance. Great Britain's return to the gold standard practically stabilized sterling within very narrow limits, around 4.85-4.86, and

in the same way the working of the Dawes Plan largely eliminated the fluctuation of the mark. Italy under the Mussolini Government succeeded in maintaining a tolerably stable exchange rate for the lire at not far from 4¢ during most of the year. Disturbances were found chiefly in the franc and in the Scandinavian exchanges as well as in Polish currency.

Due to the well known and unsatisfactory policy of France as regards finance and budgetary arrangements, the franc early showed a disposition to sink and continued this weakness with occasional intervals of greater strength up to the close of the year. During the autumn the visit of a French Commission whose purpose it was to fund the French debt to the United States gave temporary strength to the franc, which was lost when failure to come to an agreement with Washington authorities was announced. The final figure for francs for the year was 394¢, apparently with no immediate prospect for recovery unless there should be some new turn in French financial management.

Although Polish currency was fairly stable at the opening of the year under the influence of new financing the difficult economic and financial condition of the country very soon brought doubts about its ability to meet its external debt or provide for the payment of its foreign merchandise indebtedness. The result was a final quotation for the zloty of .1134. Scandinavian currencies underwent extreme fluctuations during the year owing to the belief that these countries were shortly going back to the gold standard, so that in the main their movement was quite steadily upward in spite of slight reaction at the close of the year with final figures for Danish crowns of .2473, Swedish crowns .2683 and Norway crowns .2032.

**SPECIE MOVEMENT.** Notwithstanding that the heavy foreign loans of the United States tended to offset the merchandise balance owing to that country there was a reversal of the outward gold movement which had apparently been established during the early part of the year and in the later months gold was largely shipped back to the United States. According to official figures total net exportations of gold were about \$168,898,000. The following brief table shows the movement of the specie in its main elements:

## GOLD MOVEMENT

	1925	Imports	Exports
December	.....	\$ 7,216,004	\$ 5,967,727

\* These figures represent the value of silver coin as well as bullion. The value of refined bullion is not shown on this statement, but only the ounces.

**NEW SECURITIES.** According to the figures compiled by the *New York Journal of Commerce*, railroad, industrial and public utility enterprises sold in the American market securities amounting to \$3,642,000,000, as against \$3,119,000,000 in 1924, an increase of \$500,000,000 in round numbers. Excluding refunding issues and issues designed to meet maturities new capital flotations were \$3,250,000,000. New industrial stock issues amounted to about \$1,034,000,000 as compared with \$604,661,000 in 1924. Issues of railroad bonds, notes and stocks amounted to \$474,229,000 as compared with \$963,000,000 the preceding year. Large interest was shown in industrial securities, market conditions surrounding their issue being very favorable and as a result considerable new financing took place. A feature of the year's operation was to be found in the increase of bond issues as compared with the heavy stock issues of preceding years. The public utility boom of the preceding year continued with an uncommonly large sale of new securities of all classes, particularly those of holding companies which assumed unprecedented proportions.

New and refunding issues of 1924 and 1925 classified by sources and stated in thousands of dollars were as follows:

## RAILROADS

	1925	1924	Change
Bonds ..	\$332,113,200	\$599,817,000	—\$267,703,800

COMPARATIVE PUBLIC DEBT STATEMENT  
[On the basis of daily Treasury statements]

	Aug. 31, 1919 <i>When war debt was at its peak</i>	Dec. 31, 1924	Sept. 30, 1925	Nov. 30, 1925	Dec. 31, 1925
Gross debt .....	\$26,596,701,648.01	\$20,978,632,700.46	\$20,417,758,482.50	\$20,401,347,936.78	\$20,248,169,638.43
Net balance in gen- eral fund .....	1,118,109,534.76	329,078,867.03	331,588,907.95	142,902,509.22	328,707,932.66
Gross debt less net balance in general fund .....	25,478,592,113.25	20,649,553,833.43	20,086,164,574.55	20,258,445,427.56	19,919,461,705.77

receipts were estimated as \$3,880,000,000. Ordinary expenses as \$3,618,000,000, and debt retirement expenses chargeable against ordinary income as \$325,000,000. The prosperity of the Treasury was such that at the close of the year the administration recommended a tax reduction bill curtailing incomes (largely from income and excess profit taxes) by an amount in excess of \$300,000,000. There was no material change in Treasury financial policy. Conditions in the income and debt position of the Government are represented in the tables on the preceding pages.

**BUSINESS FAILURES.** Business failures showed no very striking changes during the course of the year although they continued large in amount. As in the preceding year the number of bank failures was so great as to keep the aggregate to high levels. The following brief table shows the character of the failure situation.

FAILURES IN UNITED STATES IN 1925				
		Commercial		Banking
	No.	Liabilities	No.	Liabilities
New England	2,272	\$47,125,038	3	\$1,399,704
Middle Atlantic	5,020	132,687,727	8	12,106,238
South Atlantic	2,083	48,262,236	74	18,532,924
Southern Central	2,286	36,970,937	61	23,124,345
Central Eastern	4,247	98,710,855	11	3,327,342
Central Western	2,062	30,434,488	239	70,022,287
Western	727	10,886,355	58	34,658,681
Pacific	2,517	38,666,636	10	2,527,045
United States	21,214	\$443,744,272	464	\$164,698,516

**STOCKS AND BONDS.** The total number of shares sold on the New York Stock Exchange was 453,000,000 as compared with 281,000,000 in 1924. While business was strong pretty well throughout the year the greatest upward trend of trading took place in the last four months. The par value of bonds sold during the year was \$3,400,000,000 as compared with \$3,800,000,000 in 1924. The total number of million share days was 186 and there were also 59 two million share days. The price of Stock Exchange seats rose toward the end of the year to about \$150,000 as against a low figure for 1924 of \$76,000. During 1925 the public came into the stock market as perhaps never before, buying heavily and broadly throughout the second half of the year. Prices were generally well maintained up to the close of December. The year had begun with a January stock index (50 issues) average of about 109.05 and this rose to 138.21 for December. During the early part of the year there had been reaction, the April index showing 107.83 a temporary recession only. Railroad earnings conditions were exceptionally favorable throughout the year owing to the increase of freight and the greater economies of management. Rather better conditions abroad tended to improve the financial outlook. Bonds were tolerably stable, although held back by rising rates of money. A combined bond index including rails industrial and public bonds showed 85 at the close of the year as against 81 a year earlier. Banks continued as heavy purchasers of bonds and a feature of the year was the increasing speculation in industrial bonds which continued quite active up to the close.

**FINE ARTS.** See PAINTING AND SCULPTURE.

**FINLAND.** Formerly a grand duchy of the

Russian Empire; since Dec. 9, 1917, an independent republic; bounded on the east by Russia, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, on the south by the Gulf of Finland. Capital, Helsingfors.

**AREA AND POPULATION.** The total area exclusive of water is 132,550 square miles; population at the census of 1920, 3,366,507; estimated Dec. 31, 1922, 3,435,249. In 1922 the urban population made up 16.13 per cent of the total. The movement of population in 1922 was: Births, 80,140; deaths, 49,180; marriages, 23,524. In 1923 the emigrants numbered 13,835, of whom 13,791 went to America. The principal towns with their populations in 1922 are: Helsingfors, 201,435; Åbo, 58,457; Tammerfors, 49,398; and Viborg, 31,353. The Evangelical Lutheran religion is that of the national church to which the bulk of the population belongs, but freedom of worship is granted to all.

**EDUCATION.** For elementary education there were in 1923, 4158 schools with 235,603 pupils, 1223 lower elementary schools with 42,668 pupils, 1407 infant schools under the supervision of the church, with 170,557 pupils. In the towns there were 1359 higher elementary classes with 43,200 pupils. Secondary education was provided in 1923 by 107 lyceums, with 2115 teachers and 31,057 pupils; 53 middle schools, with 514 teachers and 7001 pupils; 46 high schools for the people, with 288 teachers and 2431 pupils; also a number of training schools for teachers. There are three universities: One at Helsingfors with 272 teachers and 2946 students in 1924; two at Åbo: one Swedish, with 35 teachers and 146 students and one Finnish with 20 teachers and 118 students. There is also a great variety of agricultural, horticultural, forestry, industrial and other technical schools. Only 0.7 per cent of the persons who had completed their fifteenth year were reported in 1920 as being unable to read or write.

**PRODUCTION.** Despite a comparatively severe climate, agriculture is the foremost factor in the economic life of Finland. Over 65 per cent of the population were engaged either directly or indirectly in agricultural or forestry pursuits. The value of the harvest increased from about 300,000,000 Finnish marks in 1911 to a total of 4,086,000,000 marks in 1922, which represents an advance of approximately 40 per cent if the intervening exchange depreciation is taken into account. The area of cultivated land in Finland was increased between 1910 and 1920 by about 8 per cent the total figure for 1920 being 4,991,593 acres. In 1923 this acreage was increased to 5,199,891. This measure of improvement was due to government support; to the system of land purchases, which caused a wider distribution of land; to the extent to which tenant farmers availed themselves of the opportunity to own land; to the coöperative movement; and to improved methods. The principal crops are rye, barley, oats, potatoes, and hay. The forests are a great source of wealth, Finland being better off in this respect than any country in Europe except Russia. See table of production by countries under AGRICULTURE. The chief industries are those connected with forest products, paper mills, and textile mills. In 1923 there were 3293 large

manufacturing plants, employing 143,311 workers, and turning out a product valued at 9,132,000,000 marks.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, striking increases in volume and value of exports characterized the trade of Finland during 1924. The year may be regarded as one of marked recovery and progress for the wood pulp and paper industries of the country. Although total imports likewise increased during 1924, mainly in response to the greater demand for industrial raw materials, this rise did not keep pace with the upward curve of exports. The net result was a favorable balance of trade for Finland, the second in the history of the country. The accompanying table shows the value of the exports and imports for 1923 and 1924 in Finnish marks, with the equivalent of the Finnish marks given in American dollars in parentheses:

<i>Item</i>	<i>Value</i>
<b>Imports:</b>	
1923 .....	4,600,302,000 (\$119,608,000)
1924 .....	4,713,350,000 (\$117,834,000)
<b>Exports:</b>	
1923 .....	4,392,494,000 (\$114,205,000)
1924 .....	4,965,622,000 (\$124,140,000)
<b>Balance, adverse (—) or favorable (+):</b>	
1923 .....	—207,808,000 (\$5,403,000)
1924 .....	+252,272,000 (\$6,307,000)
<b>Rates of conversion:</b>	
1923 .....	<i>Cents</i> 2.6
1924 .....	2.5

The volume of Finnish exports during 1924 amounted to 112.6 per cent of the 1913 volume, a point considerably higher than the 1923 percentage of 94.8 and one which illustrates the absolute increase in Finnish exports during 1924. The volume of imports on the other hand, measured in terms of 1913 figures, declined during 1924, with the index standing at 99.3 per cent as against 101.5 per cent for 1923. Great Britain took practically 40 per cent of Finnish exports, and Germany was the principal source of imports, supplying 30 per cent of the total. The United States ranked third as a source of imports and fourth as a buyer of Finnish exports. Lumber exports were the highest on record, having exceeded 1,000,000 standards (over 2,000,000,000 board feet) and Finland occupies the leading position among the lumber exporting countries of Europe. Wood pulp and paper also met with very good demand in foreign markets. Match exports were far in excess of any previous records.

**FINANCE.** A substantial increase in both income and expenditure was noted in the Finnish budget proposal for the fiscal year 1925. Ordinary revenue for 1925 was computed at 3,130,936,650 Finnish marks (1 Finnish mark equals 2½ cents) and extraordinary revenue at 500,000 Finnish marks, as compared with 2,909,600,000 and 1,500,000 marks, respectively for 1924. Ordinary expenditure was estimated at 2,734,554,800 marks and extraordinary expenditure at 625,703,000 marks; the corresponding figures for 1924 were 2,426,500,000 and 509,700,000 marks, respectively. The deficit as budgeted for 1925 thus stood at 228,818,150 marks as

against 25,400,000 for 1924; it was to be covered by transfer from the state capital fund. The chief revenue items for 1925 (1924 figures in parentheses) are as follows: State-owned enterprises, 1,089,739,000 marks (962,800,000); direct taxes, 404,150,000 (462,800,000); indirect taxes, 1,239,100,000 (1,132,100,000). The chief items of expenditure are: Ministry of Communications, 891,794,000 (969,300,000); Ministry of Defense, 390,393,600 (428,400,000); and Ministry of Education, 363,656,600 (351,800,000). Supplementary appropriations for 1924, voted by parliament, total 131,600,000 marks, which represents a large decrease over the corresponding 1923 figure of 586,000,000 marks.

**COMMUNICATIONS.** During 1923, 7647 ships of 3,459,573 net tons entered the ports of Finland; in the same year the number of ships departing was 7450 of 3,459,211 net tons. The mercantile marine on Jan. 1, 1924, aggregated 478,288 net registered tons, and consisted of 615 sailing vessels, 600 steamships, and 117 motor boats. On Jan. 1, 1924, there were 2808 miles of railways, all but 186 of which belonged to the state. The accompanying information was supplied by the United States Bureau of Foreign and Domestic Commerce:

Four railway lines were under construction to be completed during 1926 as follows: Idensalmi Ylivieska line, 154 kilometers long, connecting the northward running and central trunk lines at Idensalmi and Ylivieska, respectively; the Suojarvi line, running from Matkaselka on the Viborg-Nurmis line eastward to Suojarvi, near the Russian border, to be continued 19 kilometers to the Finnish-Russian frontier; the Transsund line, to connect Viborg with the new port development on the island of Transsund; the Kontiomaki-Sotkamo and Kontiomaki-Kiehima sections of the Nurmis-Vaala-Uleaborg line, covering a total of 40 kilometers. The Karunki-Tengeliönjoki (Karunki-Tengel River) was to be continued during 1926 and completed in 1927. This line runs for 43 kilometers along the Tornea River Valley, parallel with the Swedish line. The terminal was to be at Aavasaksa.

A normal-gauge railway line was to be built between the Hovinmaa station (15 kilometers west of Viborg on the Helsingfors-Viborg line) northeastward across the Saima Canal to Kavantsaari Station on the Viborg-Nurmis line. The work will be started in 1926 and completed in 1927.

The plans required that during 1926 a sum of 71,000,000 Finnish marks be expended on railroad construction, and thereafter a maximum of 100,000,000 marks yearly. The money was to be granted annually in connection with the budget and expended in accordance with the decision of the Council of State. If the national finances of the country would not permit the expenditure of these amounts, the programme was to be carried out in such manner that the construction time for the longer lines will be extended.

**GOVERNMENT.** Under the provisions of the republican constitution which went into effect June 14, 1919, executive power is vested in a president elected for six years by the votes of the citizens; legislative power in a house of representatives consisting of 200 members chosen by direct and proportional election, all males and female citizens who have reached their 24th year possessing the right to vote. After the elections

of April, 1924, the house of representatives was divided among the various parties as follows: Social Democrats, 60; Agrarians, 44; Finnish Coalition Party, 38; Socialist Labor Party, 18; Swedish Party, 23; Finnish Progressive Party, 17. President of the Republic, Dr. Lauri Relander, elected Feb. 16, 1925. The ministry as constituted Nov. 22, 1924, was as follows: Premier and Minister of Education, Lauri Ingman; Foreign Affairs, Hjalmar Procopé; Justice, Albert von Hellens; Interior, G. K. G. Sahlstein; Defense, Col. Lauri Malmberg; Finance, Yrjö Pulkkinen; Communications, Rolf Witting; Commerce and Industries, Axel Palmgren; Social Affairs, Lauri Pohjola.

**HISTORY.** On January 15 and 16 the Electoral College of 300 was elected. The purpose of electing this body was to have it select the next president of Finland. The returns by parties were as follows: Swedish People's Party, 35; National Coalition Party, 68; National Progressive Party, 33; Farmer's League, 69; Socialists, 79; Communists, 16. For the conference of the premiers of the Baltic states held at about the same time see *ESTHONIA, History*. On February 16 Lauri Relander was chosen president by the Electoral College. He was the candidate of the Farmer's League and received 172 votes as compared with 109 for Risto Ryti, the candidate of the Progressive Party. The new president was inaugurated March 1. On March 18 the Conservative Ministry was driven from office when it met defeat on the issue of an electoral reform bill. Professor Antti Tulenheimo (National Coalition Party) formed a new ministry which included the following members: Foreign Affairs, Dr. G. Idman; Defense, A. Lampen; Defense, H. M. Relander; Communications, Kyosti Kallio. Throughout the year the government kept up its attack on Communism throughout the country, a campaign in which the courts declared the Communist Party's actions illegal and ordered its dissolution. Action was taken against practically every Communist society in the country.

**FIRE INSURANCE.** See **INSURANCE; FIRE PROTECTION.**

**FIRE, FIRE PREVENTION.** See **CHEMISTRY, INDUSTRIAL.**

**FIRE PROTECTION. AMERICAN FIRE LOSS IN 1925.** Once again there must be recorded a disastrous total of fire loss in the United States and Canada, which for the year 1925 was only slightly below the excessive figures of the three preceding years. According to the daily fire loss records compiled by the *Journal of Commerce*, New York, the aggregate for 1925 amounted to \$373,500,550, as compared with \$377,529,250 in 1924, and with the record figures, barring conflagration years, of 1923 when the loss totaled \$410,889,350. In other words, the fire loss record of the four years of the deflation following the World War was \$1,551,111,350, or an average annual waste of the nation's resources of \$38,777,850.

In 1925 climatic conditions generally were not unfavorable and there was no serious drought during the year. At the close of December the losses increased as the result of a sudden and wide-spread cold wave but in the main there was but little to justify the great losses suffered. General business conditions were good during the year and, unlike the preceding years, there was no evidence of undue moral hazard

conditions. Taking the monthly figures of the *Journal of Commerce* for three years, as given below, it is apparent that in 1925 there was a tendency for the monthly loss record to decline to normal, but this was not maintained as the table indicates.

	1923	1924	1925
January ...	\$36,614,850	\$41,243,600	\$41,210,400
February ..	42,774,800	31,447,900	32,473,000
March .....	41,159,650	28,406,150	33,346,500
April .....	32,638,150	31,815,900	37,696,800
May .....	34,015,850	27,832,800	29,170,800
June .....	34,851,900	20,350,400	23,650,800
July .....	27,490,750	23,968,800	29,622,000
August .....	24,474,300	31,349,000	23,348,750
September ..	28,738,500	29,612,400	25,396,250
October ...	31,398,450	27,944,400	23,991,250
November ..	29,702,200	39,081,600	30,320,000
December ..	25,336,800	44,476,800	43,275,000
Total ..	\$389,192,200	\$377,529,250	\$373,500,550

The *Journal of Commerce* fire record statistics taken year by year indicate an appalling economic waste, which not only was entirely unjustified but only one that a profligate and wealthy nation could stand. The accompanying table of fire losses since 1879, covering a period of 47 years, indicates a total loss for this period of \$9,246,588,745. In the main the great fire loss of the United States is due to carelessness and the realization of this fact has led various insurance and other authorities to prosecute vigorously the campaign of education both among individuals and municipal authorities.

1925.....	\$373,500,550	1901.....	\$164,347,450
1924.....	377,529,250	1900.....	163,362,250
1923.....	889,192,200	1899.....	186,773,000

A notable instance of successful fire prevention work was in the case of the City of Fresno, California, which in 1924 won the Thomas H. Ince trophy for fire prevention work. In 1922 a campaign was started, based on the assumption that 90 per cent of the fires are preventable and that by increasing the interest of the citizens it would be possible to keep down the fire loss. From 1922 to 1925 there were three reductions in fire insurance premiums in Fresno which have resulted in the saving in annual premiums of between \$375,000 and \$400,000. The fire prevention campaign so satisfactorily carried on cost but \$32,000. See INSURANCE.

FIRES, FOREST. See FORESTRY.

FISS UNIVERSITY. A coeducational institution for negroes at Nashville, Tenn.; founded in 1866. This university, which consists of a college, high school, junior high school, and a music department, had a total enrollment of

526 in the autumn of 1925, of which 242 were men and 284 were women. This enrollment was distributed as follows: college 350; high school 97; junior high school 21; music department 166. The faculty numbered 38, of which 17 were men and 21 women. The library contained 33,000 volumes. The productive funds of the institution were \$266,125 and the income for the year was \$144,448. The dean of the institution was A. F. Shaw.

FIUME, fyöö'me. A small state consisting of a single city, whose independence was acknowledged by the Treaty of Rapallo between Italy and Jugo-Slavia, Nov. 12, 1920. After a checkered career it was turned over to Italy by a subsequent treaty with Jugo-Slavia, Jan. 27, 1924. Area, about 8 square miles; population, according to the census of 1921, 84,686.

FIXATION OF ATMOSPHERIC NITROGEN. See FERTILIZERS.

**FLAMMARION, CAMILLE.** French astronomer and author, died at his observatory at Juvisy, June 4. This well known popular writer on astronomy was born Feb. 26, 1842, at Montigny-le-Roi, the son of poor parents. He sang in the choir of Langres Cathedral and was trained at the Seminary at Langres, 1853-56. Early interested in astronomy, he went to Paris and entered at the Sorbonne. While studying he worked in an engraver's shop. A physician who attended him during an illness, discovering that the young man had been preparing a description of the universe, procured him employment as a computer at the Paris Observatory, in 1858 when he was but sixteen years of age. At an early age Flammarion wrote *La Pluralité des Mondes Habités*. It appeared in 1862, and was republished in many editions. At the time that his book was published Flammarion, dismissed from the observatory, found computing work at the Bureau des Longitudes where he was engaged until 1866. He decided to devote himself to writing on scientific topics. By 1865 he produced five successful books, which were published by Didier. In 1863 he became editor of the popular scientific magazine, *Cosmos*, and in 1865 scientific editor of the newspaper *Le Siècle*. At the recommendation of the astronomer, the publisher Didier employed Flammarion's brother Ernest, who after Didier's death succeeded to the business. The firm brought out over 50 works by Camille Flammarion. His success as an author assured, he established a small observatory at Juvisy in 1883, in a rented summerhouse. Later this property was presented to him by an admiring friend. He became interested in aeronautics and made some 12 balloon voyages between 1867 and 1880. In 1882 he founded the monthly review *L'Astronomie* of which he became editor, and also *L'Annuaire Astronomique et Météorologique*. In 1887 he founded the Astronomical Society of France, becoming its first president. He made investigations of double and multiple stars, the topography and physical constitution of Mars and the moon, and the proper motion of the stars. His last book, published in 1923, entitled *Dreams of an Astronomer*, displays the poetic imaginative quality typical of his writing even when it involved the dry statistics of the heavenly bodies. He was active in psychic research, becoming president of the Society for Psychical Research in 1923, and he wrote a number of works in this field including *Mysterious Psychic Forces* (1907), and *Death and its Mystery*, published in three parts (1920-1921-1922). In this work he suggested that in addition to phenomena due to the projection of thought acting on the mind of the recipient there were real and objective phantasms due possibly to human beings having a duplicate form which could be detached from the body. A list of Flammarion's books would include a vast number of titles; significant works which have been translated into English are: *Marvels of the Heavens* (1870); *The Atmosphere* (1873); *Urania* (1891); *Omega, the Last Days of the World* (1893); *Popular Astronomy* (1894); *Lumen* (1897); *The Unknown* (1900); *Astronomy for Amateurs* (1904); and *Mysterious Psychic Forces* (1907).

**FLAX.** According to estimates by the International Institute of Agriculture, Rome, the world's linseed production in 1925 was the largest ever recorded. The total yield of the leading

flax-growing countries excepting the Soviet Republics was estimated at 135,860,000 bushels as compared with 110,130,000 bushels in 1924 and with 128,500,000 bushels, the largest preceding crop produced, in 1912. The yield of 1925 was over 50 per cent above the average for the five years 1919 to 1923. The estimates of production for the leading countries were as follows: Argentina, for the harvest of 1925-26, 75,000,000 bushels, Canada, 9,350,000 bushels, Poland 2,305,000 bushels, and Lithuania 1,805,000 bushels. The linseed crop of India, harvested early in 1925, amounted to 21,640,000 bushels. The Argentine crop was over 60 per cent above the yield of the preceding year and nearly 50 per cent above the average for the five-year period 1919-1923. The flaxseed crop of the United States as estimated by the Department of Agriculture was 22,007,000 bushels produced on 3,012,000 acres, or at the rate of 7.3 bushels per acre as compared with 31,711,000 bushels grown on 3,469,000 acres and an average yield per acre of 9.2 bushels in 1924. Of the 10 States reporting yields, the four leading ones and their production are as follows: North Dakota 8,763,000 bushels, Minnesota 7,600,000 bushels, South Dakota 3,801,000 bushels, and Montana 1,220,000 bushels. As reported by the Bureau of the Census, the oil mills of the United States for the year ended June 30, 1925, used 40,500,000 bushels of linseed as against 36,201,000 bushels the year before. The incomplete data available relating to the flax fibre production in 1925 indicated the continued recovery of the world's fibre production which began in 1921. Information received at the International Institute of Agriculture from European countries representing about three-fourths of the world's production outside of the Soviet Republics which lead in flax fibre yield, indicated a fibre output of 429,920,000 pounds or an increase of about 38 per cent over the yield of 1924. The area in the Soviet Republics for 1924 was reported at 2,584,000 acres, and for 1925 as 17 per cent greater than that area. Semi-official estimates placed the production in 1925 at 576,000,000 pounds as against 432,000,000 pounds in 1924.

**FLETCHER, ANDREW.** American manufacturer and president of the American Locomotive Company, died in New York City, November 29. He was born in New York City, June 8, 1864, being descended from a line of Scotch shipbuilders. Educated at the College of the City of New York, he later studied naval architecture and marine engineering. He was for many years president and treasurer of the W. & A. Fletcher Company, shipbuilders of Hoboken, who built the first three turbine-driven vessels to be launched in the United States, the *Governor Cobb*, the *Yale*, and the *Harvard*, operating between New York and Boston. He also developed the ferryboat with a propeller at either end, which replaced the old side-wheel craft. Later he developed the double-compound Fletcher engine, considered one of the most efficient types for modern ferryboats. He built the Fall River line steamships *Priscilla*, *Pilgrim*, *Puritan*, and *Commonwealth*, as well as many of the Hudson River boats and several famous yachts including the *Corsair* of J. P. Morgan. Mr. Fletcher became identified with the manufacture of railway equipment and was elected a director and member of the executive committee of the American Locomotive Company. He succeeded Waldo H. Mar-

shall as president in December, 1916. He was also a director of the American Car and Foundry Company, director and president of the American Locomotive Sales Corporation, and a director and president of many shipbuilding, locomotive, railway, and other companies. He was a member of various professional societies of naval architects, of marine and mechanical engineers.

**FLONZALEY QUARTET.** See MUSIC.

**FLOOD PROTECTION.** PERU, INDIANA, FLOOD PROTECTION WORKS. The city of Peru, Indiana, having suffered considerable property damage and loss in the Ohio Valley floods of 1913 and threatened by subsequent floods in 1914, 1916 and 1919, with serious interruption to business and industrial enterprises, placed under contract flood protection works which were designed to provide adequate safety. The city of Peru, with about 15,000 inhabitants, is situated on the Wabash River, occupying the low ground along both sides with a steep rise in the north and somewhat less steep in the south. The Wabash River has a drainage yearly of about 2866 square miles, including its tributary, the Mississinawa, which joins it just above the city. Between the normal low water and high water flows, there is a difference ranging from about 900 to 50,000 second feet with elevations of 619.5 and 640 feet above sea level at Broadway. The elevation of the business section of the city is at about 639 to 645, while much of the residence portion is below El. 639. In addition to the swollen river in flood season, the runoff from the hills beyond North Peru aggravates the condition and not only are the storage areas soon filled in the case of a heavy rainfall, but the culvert carrying Prairie Ditch through the railroad embankments overflows and the eastern districts are apt to be flooded. The city had learned its lesson not only in the great flood of 1913, when 11 lives were lost and a property damage of over \$2,000,000 resulted, but in 1914 and 1916 a vast amount of damage was done and city and inter-urban railway service was interrupted. In March, 1919, all railroad communications were cut off and the electric light plant was shut down while the water works were flooded and business and industry were interrupted so that assistance from outside was required for rescue work.

The new system of flood protection works under construction in 1925 consisted of five main elements, namely: A long river flood protection on the north bank, which is partly levee, partly enlarged railway embankment and partly concrete wall; a combination of levee and concrete wall along the south bank; a drainage and intercepting ditch around the north and west sides of the city; the removal of islands and obstructions in the river channel; and the alteration of one of the six bridges crossing the river. There is also involved on the north side the diversion of Rettig Creek and the construction of a levee starting from high ground at the east and extending to the embankment of the Chesapeake & Ohio Railroad, which was to be reinforced. The river walls were to be made of plain concrete while the levees were of earth built by dragline excavation borrow pits. The Peru flood control district has an area of about 9800 acres and was organized in 1921 with a board of commissioners. Plans were submitted to the authorities for approval in 1922 and in 1925 contracts were let for much of the new work.

**PUEBLO CONSERVANCY DISTRICT.** The work begun in March, 1924, at Pueblo, Colo., as a result of the serious 1921 flood, which overtopped the levees and did considerable damage, was being prosecuted vigorously during 1925. It consisted in the relocation of the river channel along the edge of the south mesa, inclosed by a north levee, giving a  $2\frac{1}{2}$  mile channel, 30 feet deep. Six miles up the river, at Rock Canyon, a retaining dam was being built to restrain sudden flood flows. The channel thus provided would have a capacity of 125,000 second feet at 3 feet freeboard, and about 150,000 second feet when the stream was full to the banks. The proposition at the end of the year was stated to be a year in advance of the time scheduled for its completion.

**FLOOD PROTECTION IN CZECHO-SLOVAKIA.** Important flood control work on the Dyje River was being planned for construction jointly between state government and the local Department of Moravia. This involved the construction of a masonry dam about 170 feet high in the upper part of the river valley to prevent flooding of agricultural land and towns which are threatened from time to time and to control the flow of the river for hydro-electric development. It was estimated that a possible 100,000,000 kilowatts of electric energy could be produced from such a development.

At the end of the year flood conditions prevailed in Central and Western Europe and many lives were lost and much damage done in Rumania and Hungary, while vast sections of France, Belgium, Switzerland, Germany, Austria, and Czecho-Slovakia were inundated. Portions of the streets of Paris were under water.

**FLORIDA. POPULATION.** A State census was taken in 1925. The result showed a total population of 1,263,549, compared with 968,470 in 1920, an increase of 295,079 in the five-year period. A notable feature was the increase in the population of many of the towns and cities as a result of the influx of persons during 1924-25. Examples of this increase were Coconut Grove, 1445 in 1920 and 2216 in 1925; Jacksonville, 91,558 in 1920 and 95,450 in 1925; Lakeland, 7062 in 1920 and 17,051 in 1925; Miami, 29,571 in 1920 and 69,754 in 1925; Orlando, 9282 in 1920 and 22,255 in 1925; St. Petersburg, 14,237 in 1920 and 26,847 in 1925; Tampa, 51,608 in 1920 and 94,743 in 1925; Daytona Beach, 825 in 1920 and 2359 in 1925, and West Palm Beach, with 8659 in 1920 and 19,146 in 1925.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	600,000	8,100,000	\$9,072,000
	1925	580,000	8,700,000	8,700,000
Hay	1924	92,000	72,000 *	1,432,000
	1925	82,000	57,000 *	1,296,000
Sweet potatoes	1924	25,000	2,100,000	2,730,000
	1925	29,000	2,465,000	3,451,000
Oats	1924	11,000	148,000	133,000
	1925	13,000	182,000	164,000
Potatoes	1924	29,000	2,552,000	4,211,000
	1925	23,000	2,599,000	6,757,000
Cotton	1924	82,000	18,961 *	2,448,000
	1925	108,000	40,000 *	3,760,000
Tobacco	1924	6,000	4,500,000 *	1,692,000
	1925	7,000	5,480,000 *	1,693,000
Peanuts	1924	47,000	33,370,000 *	1,335,000
	1925	41,000	24,600,000 *	787,000

**MINERAL PRODUCTION.** The chief mineral products of the State in the order of their value, are phosphate rock, stone, fuller's earth, sand and gravel. Phosphate rock produced in 1923 was 2,547,653 long tons, valued at \$9,059,427, compared with 2,058,593 long tons valued at \$8,347,522 in 1922. The value of the stone produced in 1923 was \$1,425,434, compared with a value in 1922 of \$706,644. The production of fuller's earth in 1923 was 60,996 short tons, valued at \$973,121, compared with a production of 64,122 short tons in 1922 valued at \$1,122,940. The total value of the mineral products of the State in 1923 was \$12,557,822, compared with \$10,907,718 in 1922.

**FINANCE.** According to the summary of the United States Department of Commerce, the payments for the maintenance and operation of the general departments of the State, for the fiscal year ending Dec. 31, 1924, amounted to \$6,818,328. In addition to this, there were disbursed for interest on debt and outlays for permanent improvement, \$7,288,855, making a total outlay for all purposes of \$14,667,220. The per capita expenditure for maintenance and operation was \$5.55, compared with \$6.94 in 1924, and \$3.83 in 1917. The largest item of expense was maintenance and construction of highways, which was \$6,432,631.

The total revenue receipts for the fiscal year amounted to \$14,345,275, which was \$6,996,910 more than the total payments, exclusive of permanent improvements, but \$321,945 less than the total payments. The payments in excess of revenue were met from the proceeds of debt obligations. Of the total revenue for 1924, property and special taxes represented 41.8 per cent. The per capita property and special taxes were \$4.89 in 1924, compared with \$6.14 in 1923, and \$2.58 in 1917. Apart from special and property taxes, the revenues were derived from the earnings of general departments and business and non-business licenses. The total indebtedness of the State on Dec. 31, 1924, was \$3,908,030, or \$7.26 per capita. Practically all this debt was incurred for drainage purposes. The assessed valuation of property in the State for 1924 amounted to \$475,197,304. The amount of the State tax levied amounted to \$5,170,231, or \$4.16 per capita.

**TRANSPORTATION.** The total mileage of steam railroads in the State in 1924, including side-tracks and yard trackage, was about 22,723. There were constructed during 1925, 99 miles of first track and 236.5 miles of second track, or a total of 335 miles.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$188,258,000 in 1923, compared with \$145,821,000 in 1921, and \$213,326,811 in 1919. The average number of wage earners employed during 1923 was 65,038, 53,289 in 1921, and 82,986 in 1919. The "lumber and timber products" industry is the leading one in Florida, as measured either by the number of wage earners or by the value of products. This value amounted to \$52,357,000 in 1923, as compared with \$42,734,000 in 1921 and \$50,409,000 in 1919. The number of establishments whose output was \$5000 or more decreased from 1720 in 1921 to 1690 in 1923.

**EDUCATION.** The legislature made important provisions for education during the year. These included the creation of a State Educational Survey Commission and the creation of the positions of a State supervisor of high schools and a State supervisor of elementary schools. Provision was also made for free text books for all children enrolled in the first six grades of the public schools of the State. A Constitutional Amendment permitted direct appropriations by the legislature for the maintenance of common schools. The school population for the year 1923-24, was 336,930. The enrollment in the common schools was 243,227 and in the high schools, 23,091, making a total of 266,318 for 1923-24. The expenditure for education during the year 1925 amounted to \$12,267,942; and the average monthly salary for teachers was \$99.34.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the Florida State Hospital, the Florida State Prison Farm, the Florida Industrial School for Boys, the Florida Industrial School for Girls, the Florida Farm Colony for the Feeble-minded and Epileptic, and the School for the Deaf and Blind. The legislature of 1925 passed no important laws relating to charities and corrections.

**LEGISLATION.** The Commissioner of Agriculture was authorized to advertise the State and was given an appropriation for that purpose. An appropriation was also made for a super-power radio broadcasting station at the University for Florida, the slogan for which station shall be "Watch Florida Lead All." The Commissioner of Agriculture is required to broadcast information respecting crops, market conditions, and other information. A chair of Americanism and Southern history was created at the University of Florida. The gasoline tax was raised to four cents, three of which are to go to the State Road Department, and one to be divided equally between the counties. The reading of the Bible daily in all public schools, without sectarian comment, is required, and instruction in the essentials of the Constitution in all high schools, colleges and universities supported by public funds is made obligatory. It is made a misdemeanor for two or more persons to conspire to commit an offense against the prohibition laws of the State. Dogs are declared to be domestic animals and entitled to the same protection as other domestic animals. Counties are authorized to go into the warehousing business, and county commissioners are permitted to build and operate cold storage plants at county expense. Mosquito control districts are created with the approval of the electors of the territory, and having the power of taxation.

**POLITICAL AND OTHER EVENTS.** Aside from the meeting of the legislature in 1925, there were no political events of outstanding interest. The chief feature in the history of the State during the year was the development of the extraordinary boom for real estate extending practically to all parts of the State. This movement brought into Florida hundreds of thousands of persons from every State of the union, many of whom purchased land. There were several reasons for what seemed to be a sudden demand for real estate in Florida. One of these was the adoption in the November election of 1924 of an amendment to the State constitution prohibiting

the levy by the State of an income or inheritance tax. This afforded opportunity for those who wished to avoid paying these taxes to invest large sums of money in Florida. There was also an intelligent and systematic advertising of the advantages of the State. As was natural, out of this situation grew a considerable amount of reckless and fraudulent exploitation. In order to remedy this as much as possible, a meeting was held in New York in October at which were present Gov. John W. Martin of Florida and other prominent citizens. They protested against exaggeration and misstatement regarding the State, and Governor Martin declared that it was necessary only to tell the truth. In December, protracted rains caused floods in Miami and other cities which did considerable property damage.

**OFFICERS.** Governor, John W. Martin; Secretary of State, H. Clay Crawford; Treasurer, J. C. Luning; John B. Johnson, Attorney-General, R. H. Buford; Comptroller, Ernest Amos; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

**JUDICIARY.** Supreme Court: Armstead Brown, Chief Justice; Associate Justices, James B. Whitfield, William H. Ellis, Glenn Terrell, Rivers H. Buford, L. M. Strumm.

**FLORIDA, UNIVERSITY OF.** A State institution of higher learning at Gainesville, Fla.; founded in 1905. In the autumn of 1925 there was an enrollment of 1754, distributed as follows: graduate school, 31; arts and sciences, 974; agriculture, 129; pharmacy, 38; engineering, 276; law, 186; teachers, 125, the total of which amounted to 1759 with a duplication of 5. The summer session of 1925 had a registration of 1031. There were 111 members on the faculty. Endowment income for the institution amounted to \$9,881.50, and other income to \$1,005,133.75. In 1925 several important changes were made in the University. The school of pharmacy was organized into a college, the school of architecture was added to the engineering college, and the school of business administration and journalism was added to the college of arts and sciences. Among the new buildings constructed was the auditorium, a unit of the administration building; and a unit of the new library. A gift during 1925 was the Dr. Andrew Anderson Memorial pipe organ. The library

contained 40,000 volumes. President, Albert A. Murphree, LL.D.

**FOOD AND NUTRITION. FOOD PRICES, United States.** Food prices continued to soar throughout the year. The index numbers for wholesale prices reported by the Bureau of Labor Statistics, U. S. Department of Labor, were 160.3 for September and 157.6 for October, 1925, as compared with 151.6 for October, 1924, and 100 for 1913. *Bradstreet's* reported on December 23 as its weekly food index figure based on the wholesale prices per pound of 31 articles used for food \$3.57 as compared with \$3.73 on Dec. 24, 1924, and \$3.30 for Dec. 20, 1923. The Bureau of Labor Statistics' logarithmic curve of retail food prices based on 43 articles of food was higher throughout the year than at any time since the sharp decline in 1920 from the peak of war prices, and in October was 8.6 per cent higher than in October, 1924. Sugar was the only article in the list showing a marked decrease in cost, 23 per cent, while 10 articles showed an increase of more than 10 per cent during the year. The most striking increase was in potatoes, 54 per cent. This was attributed to the small crop which was estimated to be 24 per cent less than the 1924 crop. That no downward trend in retail food prices was in sight at the close of the year was indicated by the fact that the index number reported by the Bureau of Labor Statistics for November 15 was 167.1 as compared with 161.6 on October 15, an increase of nearly 3½ per cent.

**OTHER COUNTRIES.** The general trend of retail prices throughout the world may be seen from the accompanying table compiled from data reported in the Federal Reserve Bulletin of December, 1925. The index numbers, which had been constructed by the various foreign statistical offices, were based on the prices of a number of articles of food weighted according to different standards, but all unless otherwise noted referable to the original pre-war basis of 100. It will be noted that in nine of the 17 countries listed the index numbers were higher in 1925 than in 1924.

INDEX NUMBERS OF RETAIL FOOD PRICES IN PRINCIPAL COUNTRIES  
(Pre-war = 100)

Year and month	European Countries					
	Austria (Vienna) <sup>a</sup>	Belgium <sup>b</sup>	Bulgaria	England <sup>a</sup>	France (Paris)	Germany

**FOOD RESEARCH.** The work of the Food Research Institute at Stanford University as heretofore was concerned chiefly with wheat and wheat products, and the results of its investigations were published in the monthly issues of *Wheat Studies* in which the aim was to give a sound impartial review of the world wheat situation, with intensive studies of particular elements from time to time. At the Bureau of Home Economics, U. S. Department of Agriculture, laboratories for research work on the nutritive value of foods, food composition, canning, baking, and general problems of food preparation were equipped and were in operation. A *Farmers' Bulletin* on "Home Baking" was issued during the year. This gives methods and proportions for making typical yeast breads, quick breads, cakes, and other baked goods and suggests ways of substituting various ingredients such as soft wheat for hard wheat flour. A new opportunity for research in food and nutrition at the State Agricultural Experiment Stations was afforded by the passage of the Purnell bill (see AGRICULTURE). At 31 of the experiment stations definite allotments from the Purnell fund for research in home economics were made. The demand for trained research workers in nutrition to fill the positions created by the passage of the Purnell act was unprecedented.

**NUTRITION INVESTIGATIONS. Vitamins.** While considerable confusion concerning vitamin nomenclature still existed, two new letters quite definitely were added to the vitamin alphabet during the year—vitamin D for the fat-soluble antirachitic vitamin formerly thought to be identical with vitamin A, and vitamin E for the reproductive vitamin first tentatively named vitamin X by its discoverers, Evans and Bishop of the University of California. Bios, the yeast growth-promoting stimulant isolated in crystalline form by Eddy and still referred to by many as vitamin D, is now quite generally considered to fall outside the group known as vitamins and for that reason should preferably be called bios. A brief review of the outstanding work of the year on the five recognized vitamins follows.

**Vitamin A.** Using a method developed by Sherman and Munsell (*Jour. Amer. Chem. Soc.*, Vol. 47, p. 1639) for determining vitamin A quantitatively Sherman and Boynton (*Jour. Amer. Chem. Soc.*, Vol. 47, p. 1646) reported that under ordinary conditions about nine-tenths of the total vitamin A in the body of an adult rat is located in the liver, with the remaining tenth about equally divided between the muscles, blood, kidneys, and lungs. Following the feeding of diets very rich in vitamin A, there was a decided increase in the vitamin A content of the liver and a considerable increase in that of the lungs, these two organs apparently being the chief storage organs. Sherman and MacLeod (*Jour. Amer. Chem. Soc.*, Vol. 47, p. 1658) found that rats on a limited amount of vitamin A lived only about half as long as rats from the same litter reared on a diet rich in vitamin A. Death often resulted from lung infection which occurred at an age corresponding to that at which tuberculosis often develops in young people. Moreover, the very few young born in the group on the deficient diet did not survive more than two days. In commenting upon these findings the authors emphasize that

vitamin A "must be supplied in liberal proportions not only during growth but in the food of an adult as well if a good condition of nutrition and a high degree of health and vigor are to be obtained."

**Vitamin B.** Levene and Van der Hoeven, continuing their attempts at isolating vitamin B, reported at the close of the year that by a new method involving only three steps they succeeded in preparing from yeast extract a concentrate of which only 0.00008 gm. is the daily vitamin B requirement for rats. The material is said to contain 4 per cent of sulphur. In experiments conducted on rats by Osborne and Mendel (*Jour. Biol. Chem.*, Vol. 63, p. 233) and on dogs by Cowgill, Deuel, and Smith (*Amer. Jour. Physiol.*, Vol. 73, p. 106), further evidence was obtained of the quantitative relation of vitamin B to the size of the animal and of its definite effect upon the appetite. In connection with work from various laboratories testing the hypothesis advanced the preceding year by Steenbock, that experimental work on vitamin B is vitiated if the rats have access to their feces, not only was this statement verified, but evidence was obtained by Heller, McElroy, and Garlock (*Jour. Biol. Chem.*, Vol. 65, p. 255) and by Salmon (*Jour. Biol. Chem.*, Vol. 65, p. 457) that vitamin B is synthesized and stored by microorganisms normally present in the intestinal tract and may consequently be present in the feces of rats even on diets low in this vitamin. That sweeping generalizations should not be made concerning the distribution of vitamin B in cereal grains was pointed out by Croll and Mendel (*Amer. Jour. Physiol.*, Vol. 74, p. 674), who found that in the maize kernel practically all of the vitamin B is located in the embryo, although previous work by Bell and Mendel from the same laboratory had shown that in the wheat kernel the distribution is quite uniform throughout the entire grain.

**Vitamin C.** The French chemist Bezassonoff (*Compt. Rend. Acad. Sci.*, Vol. 180, p. 970) obtained from fresh cabbage juice a crystalline substance, the minimum protective dose of which for guinea pigs is less than 2 mg. daily.

**Vitamin D.** With the discovery that pure cholesterol as well as practically all natural foods containing sterols could be rendered antirachitic by suitable exposure to ultraviolet light, it was hoped that the chemical nature of the antirachitic vitamin, vitamin D, would soon be determined, but thus far attempts to isolate it in pure form or to ascertain the chemical changes taking place in the activation of cholesterol have been unsuccessful. The demonstration that skin can be easily activated is thought to afford some explanation of the beneficial effect of light in the cure and prevention of rickets. As stated by Rosenheim and Webster (*Lancet*, 1925, I, p. 1025) "the presence of cholesterol and its derivatives in the skin and its fatty secretions, together with the easy absorption by the skin of such fats rich in cholesterol as lanoline, would appear to strengthen the assumption that a vitamin formed from cholesterol in the skin under the influence of light would be easily absorbed and thus liberated into the blood stream." Successful results were reported during the year in the use of irradiated foods in place of cod liver oil in the treatment of infantile rickets. Irradiated milk was used by Kramer in the United States (*Amer. Jour. Dis-*

eases Children, Vol. 30, p. 195) and by Cowell in England (*Brit. Med. Jour.*, 1925, No. 3352, p. 594), irradiated olive oil by Steenbock and Daniels (*Jour. Amer. Med. Assoc.*, Vol. 84, p. 1093), and irradiated carrots, spinach, and dry milk by Hess (*Jour. Amer. Med. Assoc.*, Vol. 84, p. 1910). Dr. Hess, however, questioned the practicability of using such materials in the treatment of rickets in place of naturally antirachitic substances such as cod liver oil or egg yolk. In this connection it is of interest to note that Hart, Steenbock, et al. reported (*Jour. Biol. Chem.*, Vol. 65, p. 579) that the egg yolks from hens which had been systematically irradiated with ultraviolet light had approximately 10 times the antirachitic potency of egg yolks from nonirradiated hens.

**Vitamin E.** Further evidence was obtained by Evans at the University of California of the existence of a fat-soluble vitamin essential to reproduction. In studies reported to the National Academy of Science (*Proc. Natl. Acad. Sci.*, Vol. 11, p. 373) it was shown that this vitamin is necessary to prevent sterility in the male as well as the female. Sterility in male rats was prevented by the same natural foods or extracts prepared from them which had proved curative for sterility in females. Six drops daily of wheat germ oil fed from the time of weaning completely prevented sterility, but sterility brought about by the absence of vitamin E was much more difficult to cure than to prevent. Next to wheat germ oil, fresh lettuce leaves are said to be the most potent source of this vitamin.

**Iron.** In the first of a series of studies on Iron in Nutrition, Hart, Steenbock, Elvehjem, and Waddell (*Jour. Biol. Chem.*, Vol. 65, p. 67) reported that rats on a sole diet of milk with sufficient sodium citrate to prevent the formation of a hard curd invariably came down with anemia, and that this could be delayed but not prevented by the addition to the diet of cabbage or iron oxide alone and entirely prevented by the addition of iron oxide with either fresh cabbage, the alcoholic extract of dried cabbage or yellow corn meal, and chlorophyll. In endeavoring to explain these results, vitamins A, B, C, and D were ruled out by experimental evidence. It was suggested that if further investigation should exclude vitamin E as the factor concerned it would appear probable that in addition to the known vitamins certain complexes necessary for hematin building must occur preformed in the diet.

**Iodine.** Attention was called by Middleton (*Jour. Amer. Med. Assoc.*, Vol. 84, p. 1172) to an increase in the incidence of goitre in certain sections of Utah where the water supply had been changed from wells and surface springs to systems having their source in the mountain springs. The increase in goitre was attributed to the lack of iodine in the springs coming from igneous rocks, and the probability was suggested that all volcanic or granitic sections of the country would be found to have a relatively high percentage of goitre incidence. The report by Olesen (*U. S. Pub. Health Rpts.*, Vol. 40, p. 1) of a goitre survey in Colorado stated that 25.6 per cent of the 3950 boys and 30.4 per cent of the 13,451 girls examined had some degree of thyroid enlargement. Thyroid examinations conducted by Goldberger and Aldinger (*Amer. Jour. Diseases Children*, Vol. 29, p. 780) on

11,024 school girls in New York City indicated some signs of thyroid enlargement in 20.3 per cent of the 9978 white girls and in 13.6 per cent of the 1106 colored girls examined. That goitre should exist to such an extent in a geographically nongoitrous region would seem to afford an argument in favor of the universal use of the iodized salt which is now on the market.

**Sunlight and Nutrition.** The topic which received the greatest attention in nutrition literature during the year was the effect of sunlight and of ultraviolet light such as is obtained from a quartz mercury vapor lamp. The effect of irradiation of food materials has been noted under vitamin D. Studies conducted by Henderson on pigs (*Biochem. Jour.*, Vol. 19, p. 52), by Mitchell and Johnson on rats (*Amer. Jour. Physiol.*, Vol. 72, p. 143), and by Mayerson, Gunther, and Laurens on dogs (*Proc. Soc. Expt. Biol. Med.*, Vol. 22, p. 469) as well as many clinical reports on cases of infantile rickets have shown in all cases that ultraviolet irradiation of the body under suitable conditions raises low levels of blood calcium and phosphorus to normal and brings about optimum metabolism of these elements with healing of rachitic lesions where present. Henderson emphasized, however, that the proper balance of inorganic constituents in the diet was of the utmost importance, and that if these were maintained the influence of light was not so important. In the clinical treatment of rickets, ultraviolet light treatments in connection with cod liver oil have been found to bring about more prompt recovery than either one alone. At the annual meeting of the British Medical Association at Southampton, England, the sections on public medicine and on therapeutics devoted considerable time to a discussion of the influence of sunlight and artificial light on health. It was reported that at a certain infant welfare centre ultraviolet light treatment was given during the winter months with beneficial results to nursing mothers whose breast-milk was failing or whose babies were not thriving, and to children up to five years of age suffering from simple dietetic troubles and malnutrition. For an excellent discussion of the influence of sunlight on health the reader is referred to the volume *Sunlight and Open Air*, by L. Hill in the bibliography noted below.

**FOOT-AND-MOUTH DISEASE.** See VETERINARY MEDICINE.

**FOOTBALL.** Football's hold on the sport-loving American public was never so strongly emphasized as during the record-breaking season of 1925, the throngs witnessing the more important games ranging in numbers from 40,000

to 100,000. Although a championship rating is impossible in college football, the recognized experts of the game generally agreed that the wonderful eleven turned out by Dartmouth College could have taken the measure of any team in the United States at the season's close. This wonder aggregation of players dominated by the colorful "Swede". Oberlander amassed a total of 127 points against Harvard, Cornell and Chicago and swept through its difficult schedule of contests without defeat. It was the second year in succession that the wearers of the green had escaped any reverse.

Among the Western Conference colleges Michigan attained the highest ranking despite the unexpected defeat inflicted by the team of Northwestern University. In the South two elevens appeared to be nearly on an equal footing, Alabama and Tulane. The University of Washington team reigned supreme along the Pacific Coast. The most prominent individual performers on the gridiron during 1925 were Harold "Red" Grange of the University of Illinois, Oberlander of Dartmouth, Tyron of Colgate, Wilson of the University of Washington, Friedman of Michigan and Nevers of California.

A summary of the games played by the leading college elevens follows:

Dartmouth 59, Norwich 0; Dartmouth 34, Hobart 0; Dartmouth 50, Vermont 0; Dartmouth 56, Maine 0; Dartmouth 32, Harvard 9; Dartmouth 14, Brown 0; Dartmouth 62, Cornell 13; Dartmouth 33, Chicago 7.

Michigan 39, Michigan Aggies. 0; Michigan 63, Indiana 0; Michigan 21, Wisconsin 0; Michigan 3, Illinois 0; Michigan 54, U. S. Naval Academy 0; Michigan 2, Northwestern 3; Michigan 10, Ohio State 0; Michigan 35, Minnesota 0.

Alabama 53, Union 0; Alabama 42, Louisiana State 0; Alabama 27, Sewanee 0; Alabama 7, Georgia Tech. 0; Alabama 6, Mississippi Aggies 0; Alabama 31, Kentucky 0; Alabama 34, Florida 0; Alabama 27, Georgia 0.

Tulane 77, Louisiana 0; Tulane 6, Missouri 6; Tulane 26, Mississippi 6; Tulane 25, Miss. A. and M., 3; Tulane 18, Northwestern 0; Tulane 13, Auburn 0; Tulane 37, Louisiana Tech., 0; Tulane 14, Sewanee 0; Tulane 16, Louisiana State 0; Tulane 14, Centenary 0.

Washington 108, Willamette 0; Washington 30, Montana 10; Washington 6, Nebraska 6; Washington 64, Whitman 2; Washington 23, Washington State 0; Washington 13, Stanford 0; Washington 7, California 0; Washington 78, Puget Sound 7; Washington 15, Oregon 14.

Princeton 20, Amherst 0; Princeton 15, Washington and Lee 0; Princeton 10, U. S. Naval Academy 10; Princeton 0, Colgate 9; Princeton 19, Swarthmore 7; Princeton 36, Harvard 0; Princeton 25, Yale 12.

Colgate 28, Canisius 0; Colgate 60, Clarkson 0; Colgate 49, St. Bonaventure 0; Colgate 7, Lafayette 7; Colgate 9, Princeton 0; Colgate 14, Michigan Aggies 0; Colgate 19, Providence 7; Colgate 19, Syracuse 6; Colgate 14, Brown 14.

Yale 53, Middlebury 0; Yale 35, Georgia 7; Yale 13, Pennsylvania 16; Yale 20, Brown 7; Yale 28, U. S. Military Academy 7; Yale 43, Maryland 14; Yale 12, Princeton 25; Yale 0, Harvard 0.

Missouri 6, Tulane 6; Missouri 9, Nebraska 6; Missouri 32, Rolla Mines 0; Missouri 3, Kansas Aggies 0; Missouri 23, Iowa State 8; Missouri 14, Washington College 0; Missouri

16, Oklahoma 14; Missouri 7, Kansas 10. U. S. Military Academy (Army) 31; Detroit 6; Army 26, Knox 7; Army 27, Notre Dame 0; Army 19, St. Louis 0; Army 7, Yale 28; Army 14, Davis Elkins 6; Army 7, Columbia 21; Army 44, Ursinus 0; Army 10, U. S. Naval Academy 3.

U. S. Naval Academy (Navy) 25, William and Mary 0; Navy 19, Marquette 0; Navy 10, Princeton 10; Navy 37, Washington (Md.) 0; Navy 0, Michigan 54; Navy 27, Western Maryland 0; Navy 13, Bucknell 7; Navy 3, Army 10.

Professional football evinced a considerable gain in popularity in 1925, especially in the larger cities of the Eastern United States. For the first time the Polo Grounds at New York City were thrown open to this sport and as the games were played on Sundays large crowds were attracted to them. The signing of Harold "Red" Grange who had so distinguished himself earlier in the year as a college player to a contract by the Chicago "Bears" contributed no little to the booming of the professional game. See SOCCER.

FORD, HENRY JONES. Professor of Politics at Princeton University, died August 29 at Blue Ridge, Summit, Pa. He was born at Baltimore, Aug. 25, 1851, and graduated from the Baltimore City College in 1868. Taking up newspaper work he became an editorial writer on the *Baltimore American* in 1872, was managing editor, 1875-79. His newspaper career included editorial positions with the *New York Sun*, 1879-83; the *Baltimore Sun*, 1883-85; managing editorship of the *Pittsburgh Commercial Gazette*, 1885-95; of the *Pittsburgh Chronicle Telegraph*, 1895-1901; and editorship of the *Pittsburgh Gazette*, 1901-05. He was lecturer on political science, 1906-07, at Johns Hopkins University, and in 1908 went to Princeton University as professor of politics. In 1912 he was commissioner of banking and insurance of the State of New Jersey, and, 1920-21, a member of the Interstate Commerce Commission. He was the author of *The Rise and Growth of American Politics* (1898); *The Cost of Our National Government* (1909); *The Scotch-Irish in America* (1915); *The Natural History of the State* (1915); *Woodrow Wilson, the Man and His Work* (1916); *Washington and His Colleagues* (1918); *The Cleveland Era* (1919); *Alexander Hamilton* (1920); and *Representative Government* (1923).

FORDHAM UNIVERSITY. A Roman Catholic institution for the higher learning at Fordham, New York City; founded in 1841. It is the largest Catholic educational institution in America, and is under the Society of Jesus. The enrollment for the year 1925 totaled 6310 students, including a registration of 1012 in the summer session, 1200 in the graduate school and teachers college, and a distribution among the other colleges as follows: law 1470; pre-law 270; college 950; accountancy 156; pharmacy 582; social service 160; preparatory work 510. The number of members in the faculty, exclusive of summer school and summer session, were 200. A new library and gymnasium were erected during 1925. The endowment fund June 30, 1925, amounted to \$103,000. There were 100,000 volumes in the library. President, Rev. William J. Duane, S.J., Ph.D.

FOREIGN EXCHANGE. See FINANCIAL REVIEW.

FORESTRY. Following a year rendered

outstanding by the passage of the Clarke-McNary Forestry Law, which embodied a definite forest policy for the entire Nation and provided for increased coöperation between the Federal Government and the States in the protection and the development of the forests, 1925 forestry activities suffered by comparison. However, satisfactory progress was made in putting the legislation into operation and in awakening interest in the possibilities of the new act. Recognizing the inadequacy of the initial appropriations under the act, a determined effort was made in 1925 by various forestry organizations and civic associations to have the appropriations increased sufficiently in 1926 to meet the needs of the situation. That the public was back of the movement to conserve the nation's forest resources was evidenced in the almost universal approval of the Clarke-McNary Act. With assurance of equitable taxation and improved fire protection, it was generally believed that commercial interests gladly would undertake the reforestation of their cut-over areas. As evidence of this attitude, the Long-Bell Lumber Company instituted forest management upon approximately 200,000 cut-over acres in Arkansas, Louisiana, and Texas, including the laying out of permanent sample plats for the determination of the best methods of culture, cutting, and thinning.

**THE LUMBER SITUATION.** A significant increase in lumber production in the United States in 1925 was indicated in preliminary figures furnished by the National Lumber Manufacturers' Association, the estimated production reaching the probable total of 39,000,000,000 feet, as compared with 37,000,000,000 feet in 1924. The demand for lumber was stimulated by unusual building activities, which continued unabated throughout the whole year, the boom reaching a high peak in Florida due to unprecedented developments in that State. So great was the amount of lumber and building materials required in Florida operations that the railroads were unable to cope with the situation, and were forced in late October to issue an embargo on the shipment of building supplies, an act causing much discomfiture to the lumber and building trades. Rapid expansion of water movements failed to fully meet the insistent demand for supplies. That the Panama Canal renders effective service in the transport of lumber was shown in rough estimates of the passage of a half billion feet from western to eastern ports through this waterway in 1925.

**NATIONAL FORESTS.** According to the Report of the Forester, U. S. Department of Agriculture, the net area of the national forests on June 30, 1925, was 158,395,056 acres, an increase of nearly 1,000,000 acres during the fiscal year. The largest accessions were in Alaska, where 1,104,169 and 254,057 acres were added to the Tongass and Chugach Forests, respectively. Certain eliminations were also made in carrying out the policy of consolidating national forests by the sale of outlying units, or exchange for private lands within the national forests. Receipts from the national forests aggregated approximately \$5,000,000, three-fifths of which was obtained from the sale of timber and the balance largely from grazing receipts. An effort on the part of certain livestock interests to secure permanent grazing rights in the national forests was viewed with alarm by

foresters and forest conservationists, it being feared that lasting injury to reproduction would be wrought by overgrazing. Furthermore, it was deemed that the forests, being the property of the people, should be retained strictly in their control. Despite liberal inducements, no commercial interests took the opportunity of establishing pulpwood mills in the Alaska national forests, where vast timber resources, supplemented by an abundance of water power, would seem to insure success as soon as economic conditions in the nation's pulpwood supply justify shipments to the States.

**FOREST FIRES.** Fire, the insidious enemy of the forest tree from the beginning to the end of its life, continued during the year 1925 to take a heavy toll. Based on data presented in the 1925 Report of the Forester of the U. S. Department of Agriculture, there were, up to September 10, 7520 fires in the national forests alone, burning over an aggregate of 321,898 acres. Beginning in the early season, fires were especially prevalent in Arizona and New Mexico. Unfavorable midsummer conditions in northern Idaho and Montana resulted in frequent and widespread fires, as many as 100 a day being recorded in mid-August. Long continued droughts in the south Appalachian region were the primary cause of large destructive forest fires, which raged with more or less severity until finally stopped by September rains. So severe were the drains on the fire-fighting resources that the appropriations for the entire fiscal year were exhausted in the early part of the period. Airplanes were successfully used by the Forest Service of the U. S. Department of Agriculture in the detection and reconnaissance of fires, and, because of their ability to rise above the smoke, were particularly useful in analyzing large fires.

**DANGEROUS PESTS.** Second only to fire in disastrous effects on the forest resources were the attacks of insects and diseases. Bark beetles, usually considered minor but ubiquitous enemies in the forest, caused unusually severe damage in 1925. A severe outbreak in the mature pines in the Kaibab National Forest, Arizona, and the adjoining Grand Cañon National Park was effectively checked by joint action of the Federal Forest Service and the Bureau of Entomology. However, a potentially more serious and widely spread outbreak of beetles in western Montana threatened to injure valuable and accessible timber despite the efforts to control the pest. White pine blister rust, the devastating enemy of five-needled pines, spread rapidly through the forests of western Canada during the summer season, threatening with almost inevitable destruction the valuable western white pine stands of northern Idaho and Washington. In the southern Appalachian forests chestnut blight spread with alarming rapidity, making almost certain the ultimate destruction of the remaining stands of the American chestnut, once a conspicuous component of our eastern forests. See BOTANY.

**FOREST RESEARCH.** Coincident with the steady awakening of the nation to its pressing forest problem, increased interest was manifested during the year in research upon the fundamentals underlying the development of scientific forestry. Working with eight species of conifers grown under controlled light conditions, the Forest Service of the U. S. Department of

Agriculture (*Jour. Forestry*, 23 [1925], No. 11) found that plants thrive in light intensities even lower than those usually present in the densest forest, leading to the conclusion that rooting capacities of the species and soil moisture are greater limiting factors in the forest than is the lack of light. Studies in northern Idaho by the Forest Service (*Jour. Agr. Research* [U. S.], 30 [1925], No. 12) indicated that adequate restocking usually follows a single destructive fire, but that subsequent fires destroying the immature stand result in almost complete denudation. Studies carried out under actual field conditions by the Yale University School of Forestry (*Yale Univ. School Forestry Bul.* 11, 1924) upon the cause of death in germinating conifers gave further evidence that intense heat at the ground surface rather than soil desiccation is the chief limiting factor in survival.

With a view to completing the chain of forestry research stations, bills were introduced into Congress during the year for the establishment of two stations, one in the Ohio-Mississippi river region and one in the Northeast.

At Madison, Wis., the Forest Products Laboratory of the Forest Service of the U. S. Department of Agriculture, continued its fruitful investigations on the better utilization and preservation of wood. Among other results, it was found that hickory and elm produced in properly thinned stands showed evidence not only of more rapid growth but also of greater strength in the wood. The redesigning of wooden containers used for shipping explosives promised important savings in lumber and in shipping charges. The value of zinc chloride and sodium fluoride solutions as preservative media for treating posts, poles, and other farm timbers was demonstrated. Studies of the peculiarities of various woods in reference to paint requirements indicated the possibility of developing special treatments, which should result in great savings to the general public.

WORLD FORESTRY CONGRESS. Official announcement was received from Italy during the summer of an international forestry congress sponsored by the Italian Government and the International Institute of Agriculture, to be held in Rome, Italy, April 29 to May 5, 1925, for the purpose of bringing together all important forest producing nations to consider the serious problem of increasing the world supply of timber, now being utilized greatly in excess of the normal production of the forests.

NECROLOGY. Sir William Schlich, noted British forester, died Sept. 28, 1925. Coupled with his long and notable service in India and his effective filling of the chair of forestry in Oxford University was his ability as a writer on forest subjects, his classical work entitled a *Manual of Forestry* standing as a lasting memorial to his name.

BIBLIOGRAPHY. Although a very considerable number of magazine and other short articles relating to forestry and allied subjects appeared during the year, the number of books was unusually small. Among these may be noted the following: W. S. Jones, *Timbers: Their Structure and Identification* (Oxford, Eng., 1924); R. S. Maddox and A. E. Parkins, *Our Trees and How They Serve Us* (New York, 1925); W. Schlich, *Schlich's Manual of Forestry*.—III,

*Forest Management, Including Mensuration and Valuation* (London, 1925, vol. 3, 5 ed., rev.).

FORMOSA or TAIWAN. An island off the coast of the Chinese province of Fukien, formerly belonging to China but ceded to Japan, May 8, 1895. Area, 13,330 square miles; population according to the census of 1920, 3,654,398; estimated in 1922, 3,904,692. In 1922 there were 177,953 Japanese and 29,368 foreigners on the island. Capital, Taihoko, with a population of 180,362 in 1922. Other important towns are Tainan, Kagi, and Taichu. In 1921-22 there were 132 primary schools for the instruction of the Japanese, with 709 teachers and 21,372 pupils and for the instruction of natives, there were 531 schools with 4732 teachers and 178,495 pupils.

Formosa produces in commercial quantities nearly every tropical, subtropical, and temperate zone product. The island supplies all of the world's Oolong tea and produces nearly all of the world's natural camphor. The sugar industry, however, is the most important. The production of raw sugar amounts to more than 1,000,000,000 pounds annually and is increasing rapidly. Of the 156 sugar factories in operation in 1925, 44 were thoroughly modern plants. The entire output is shipped to Japan, with the exception of that used in local consumption and an inferior grade shipped to China. The production of tea averages about 21,000,000 pounds annually of which the United States takes about 10,000,000 pounds. The production of crude petroleum in 1924 was estimated to be 1,000,000 American gallons. The yield of rice was over 25,000,000 bushels and the 1924 banana crop was valued at \$5,000,000. The indigo, hemp, pineapple, grapefruit, papaya, peanut, bean, and cereal industries are also important producers. Gold, silver, and copper are produced in considerable quantities, and coal and sulphur are exported. The accompanying table supplied by the United States Bureau of Foreign and Domestic Commerce shows the trade by countries for 1914, 1923, and 1924:

## FOREIGN TRADE OF TAIWAN, BY COUNTRIES

Countries	1914	1923	1924
<i>Imports</i>			
United States . . .	\$400,297	\$3,185,369	\$1,752,615
Great Britain . . .	639,013	979,034	1,442,860
China . . . . .	3,653,444	8,749,118	13,163,558
Japan . . . . .	19,939,574	35,509,063	43,301,030
Other countries .	1,814,213	6,642,340	6,852,985
Total . . . . .	26,446,541	55,064,924	66,518,048
<i>Exports</i>			
United States . . .	2,800,123	3,298,434	2,628,565
Great Britain . . .	320,900	420,352	583,990
China . . . . .	1,740,173	5,262,761	11,077,114
Japan . . . . .	22,869,058	84,721,183	105,549,112
Other countries .	1,629,961	5,594,672	6,998,307
Total . . . . .	29,360,215	99,297,402	126,837,088

NOTE.—The yen has been converted to dollars at the rate of 1 yen to \$0.50. The par value is \$0.4985, but the exchange has fluctuated above and below this point during the period covered.

The revenue for the fiscal year 1922-23 was 113,420,521 yen and the expenditure, 96,346,516 yen. The island is under a governor-general, who is supported by a well-organized force of Japanese police. Governor-general at the beginning of 1925, Takio Izawa.

**FORTY-EIGHT, COMMITTEE OF.** A political movement engaged in the organization of a national Progressive party whose platform is the abolition of privilege, meaning by privilege the unjust economic advantage by possession of which a small group controls natural resources, transportation, industry and credit. It is composed of representatives from the 48 States of the Union, from which it derives its name. The Committee operates by building up its party State by State, and delegates from the States so organized assemble at a national conference. The principles advocated are the public control of natural resources, public ownership of railroads, governmental banking, and equal rights for all citizens. By means of a bureau of information the organization undertakes to educate the public in party issues through an established news service to some 500 papers. At election time it assists in the formation of progressive parties in the various States. In addition a practice of "pamphleteering" is carried on during presidential and congressional elections, presenting through pamphlet service information relative to domestic economic issues which are subjects of controversy or contest. Membership in the committee or party is on a dues-paying basis, and the amount of the monthly payment is left to the discretion of each enrolling person. A monthly magazine, *The Liberal*, is published at the national headquarters, 15 East Fortieth Street, New York. In 1925 the officers were as follows: J. A. H. Hopkins, chairman of the executive committee; Melinda Alexander, secretary; Charles H. Ingersoll, treasurer; and Frank A. Pattison, chairman of the National Bureau of Information and Education.

**FOSHAGITE.** See MINERALOGY.

**FOX-FARMING.** See ALASKA.

**FRANCE.** A republic of western Europe, lying between 42° 20' and 51° 5' N. latitude, and 70° 45' W. longitude. Area, before the war, 207,054 square miles; total area in 1925, 212,659 square miles. The additions, obtained under the Peace Treaty, and corresponding to Alsace-Lorraine under the German Empire, comprise the new departments of Bas-Rhin, 1848 square miles; Haut-Rhin, 1354 square miles; and Moselle, 2403 square miles.

**POPULATION.** According to the census of 1921, the population was 39,209,518, including the territory acquired from Germany but not including the military and naval forces and the crews of merchant ships abroad. The exclusions numbered 192,973 in 1921. The population according to the census of 1911 was 39,604,992 excluding Alsace-Lorraine. The populations of the three departments acquired from Germany were according to the census of 1921, Bas-Rhin, 651,686; Haut-Rhin, 468,943; and Moselle, 589,120. The cities with a population of over 200,000 at the census of 1921 were as follows: Paris, 2,906,472; Marseilles, 586,341; Lyons, 561,592; Bordeaux, 267,409; and Lille, 200,952. The population of the devastated regions, reduced from 4,654,000 to 2,075,000 during the war, had risen to 4,250,000 in January, 1924. The movement of population in 1923 was: Births, 761,861; deaths, 666,990; marriages, 356,501; divorces, 23,600. For the first time since 1920 the number of births showed an increase over the preceding year.

Discussion was rife throughout the year con-

cerning the falling French birth rate. A series of questions were propounded to leading Frenchmen by Ludovic Naudeau at the close of the year and resulted in some interesting and pertinent answers. Fourteen leaders were questioned in all. The main and most important conclusion was that of six out of the fourteen, namely that France must increase her population if she desires to keep her position in the world. The curious thing is that the French do not realize that they do already produce abundant children. The French birth rate for 1923 was 19.4 per thousand of the population as compared with 19.7 for England and Wales. On the other hand the death rate for France in the same period was 17 per thousand as compared with 11.6 for England and Wales. Deaths under one year for the same year in France were 96 per thousand births, as compared with 69 in England and Wales. Generally speaking the high death rate may be assigned to ignorance and defective hygienic conditions, and for these education and an active health campaign would seem to be the only remedy. Aid was given to 50,000 children per year and to 285,000 mothers, and the proposed law of social assurance would give lying-in mothers considerable benefits. There were 1468 organizations for the care of mothers and children which received subventions from the state to the amount of 4,000,000 francs. Of the births no fewer than one-third are illegitimate, and of the illegitimate children put out to nurse 50 per cent are believed to die at a tender age. The practice by which peasant mothers resume work immediately after their confinement and put their children out to nurse is almost as deadly. There is no doubt that the birth rate could be increased. It has been calculated that, because of the war, 1,500,000 women in France are doomed not to marry, and there is a campaign in progress for improving the attitude of the community toward unmarried mothers. On the other hand, it is estimated that abortion is produced in one-third of the cases of conception. For purposes of comparison, it is interesting to note that in Germany in 1924 there was an excess of births over deaths of 508,938, and there were fewer deaths by 108,799 than in 1923.

**EDUCATION.** Primary education is free and compulsory for children between the ages of 6 and 13. The following table from the *Statesman's Year Book* for 1925 shows the condition of primary instruction in 1922-23 and 1923-24:

	1922-23		1923-24	
Description of schools	Schools *	Enrolled pupils *	Schools *	Enrolled pupils *
Infant Schools:				
Public .....	3,081	281,655	3,030	280,868
Private .....	772	81,194	716	84,764
Total .....	3,803	262,849	3,749	315,632
Primary Schools:				
Public .....	69,288	3,392,832	69,198	3,175,636
Private .....	12,484	817,314	12,250	797,894
Total .....	81,772	4,210,146	81,448	3,973,530

\* For all the 90 Departments of France.

Secondary education is provided by *lycées* supported by the state, colleges supported by the communes, and free schools supported by

private individuals and associations. Higher education is provided by the state universities, special schools under the direction of the state and various private schools and faculties. The following tables from the source mentioned above show the 17 universities of France with the date of their founding and the number of students on July 31, 1923, as well as the number of students by faculties for 1921, 1922, and 1923:

<i>Universities</i>	<i>Students</i>
Aix-en-Provence (1409) .....	1,705
Algiers .....	1,532
Besançon (1485) .....	328
Bordeaux (1441) .....	2,728
Caen (1432) .....	1,009
Clermont-Ferrand (1898) .....	489
Dijon (1722) .....	815
Grenoble (1339) .....	2,325
Lille (1530) .....	1,953
Lyon (1808) .....	3,253
Montpellier (1125) .....	2,208
Nancy (1572) .....	1,922
Paris (1150) .....	21,435
Poitiers (1431) .....	1,237
Rennes (1735) .....	2,145
Strasbourg (1567) .....	2,819*
Toulouse (1230) .....	2,414
Total .....	50,367

\* Including 217 students in the two faculties of Theology.

<i>Students of</i>	<i>1921</i>	<i>1922</i>	<i>1923</i>

Other institutions dependent upon the ministry of public instruction include: Collège de France; Museum of Natural History (which gives instruction in sciences); Practical School of Higher Instruction, with its seat at the Sorbonne, offering courses in history, philology, and science, École des Beaux Arts; and various others. Dependent upon the other ministries are diverse institutions of technical instruction, including schools of commerce, agriculture, mines, forestry, military and naval science, etc., and finally there are numerous technical schools of a lower grade dependent upon the ministry of public instruction.

**AGRICULTURE, MINERAL RESOURCES, ETC.** The following account of French production during 1925 was supplied by the United States Bureau of Foreign and Domestic Commerce. Industry and trade in France during 1925 made notable progress in various directions, but the prospect for continuance of favorable conditions was limited by the uncertainties of public finance. Statistics of value on articles produced in France lose much of their worth as an index of economic activity through the disturbance of price levels and the currency system; hence the best indication of the recovery of French economic life is found in statistics which are not affected by changes in price or value. There has been no lack of employment for French labor in recent years. Moreover, France has recently risen from a minor position

as a country receiving immigration to one of the leading nations in that respect. The newcomers, unlike those of pre-war years, now enter the country not only in response to seasonal demands but with contemplation of permanent or indefinite residence. During 1923 and 1924 the balance of immigrant arrivals over departures was approximately 200,000 for each year, and in the first three-quarters of 1925, though less important, still reached 75,453.

While sugar production had not returned to its pre-war level, the reorganization of the industry had brought about much greater efficiency and economy in the operation of plants. The tendency to reestablish the industry with fewer, larger, and better organized plants made it possible for 107 establishments in 1924-25 to produce 830,000 long tons, whereas the output of 213 such establishments in 1912-13 was only 973,000. The yield had recovered notably in the past five crop years—from 306,073 tons in 1921-22 to 492,765 tons in 1922-23, to 490,850 tons in 1923-24, to 830,000 tons in 1924-25 and, though slightly reduced, to 800,000 tons in 1925-26. Alcohol production shows a less important total than in 1912-13, owing to the decline in the use of beets, molasses, and farinaceous products for the production of industrial alcohol; but the amount of alcohol derived from grapes, apples, pears, other fruits and fruit residues has shown fair increase. The total production, therefore, although still below the 3,229,100 hectoliters of 1912-13, has nevertheless expanded in recent years until in 1924-25 it reached 2,223,800 hectoliters.

French agriculture had recovered in remarkable degree from the ravages caused by military operations. The wheat and barley yields for 1925 exceeded those of 1913, and rye and oats showed totals approximating the earlier period. Production figures are shown in the following table:

YIELD OF FRENCH GRAIN CROPS

<i>Crop</i>	<i>1913</i>		<i>1925</i>	
	<i>Metric tons</i>	<i>Bushels</i>	<i>Metric tons</i>	<i>Bushels</i>
Wheat .	8,691,905	819,340,590	8,956,100	329,047,100
Rye .	1,271,475	51,059,971	1,137,100	44,767,630
Barley .	1,043,760	47,939,897	1,065,500	48,938,420
Oats .	5,182,601	357,029,383	4,794,600	330,300,000

Although mining activity in France is conducted along a wide variety of lines, iron ore and coal far exceed other lines in importance. The acquisition of Alsace-Lorraine makes the total output of both these minerals more important than it would otherwise be. French production of iron ore in 1913 averaged 1,826,000 metric tons per month, but at that time the Metz-Thionville Basin, which is now French, was in German territory. As this region then produced an average of 1,760,000 tons per month, the total 1913 production in the present area of France averaged 3,586,000 tons. Post-war production in France has steadily advanced from only 1,160,000 metric tons per month in 1920 to 2,416,000 tons in 1924. The 3,090,000 tons of iron ore raised in September, 1925, represents not only a considerable advance over pre-war French production but an approach to the total resulting from inclosure of the product from the Metz-Thionville Basin.

Coal production shows a similar revival. The average monthly production in 1913 from

the French territory as now constituted was 3,720,000 metric tons, but the output fell to 2,415,000 metric tons per month in 1921. A steady recovery since that time has brought production to a monthly average of 3,746,000 tons in 1924 and to the high level of 4,278,000 tons in October, 1925. The rate of operation in October was thus about 13 per cent greater than in the average month of 1913. Mining operations in other fields show less spectacular advances, but industrial activity in all lines approaches or exceeds that of any previous period. The output of bauxite, which in 1913 averaged 25,800 metric tons per month, in 1924 reached 28,000 metric tons, and in September, 1925, advanced to 33,300 metric tons. Salt production has steadily increased, especially salt for industrial uses, which averaged 68,100 metric tons per month in 1924 as against 46,200 metric tons in 1913. The production of mineral oils, while not extremely important, had advanced from a monthly average of 4000 tons in 1913 to an average of 6200 tons in 1924. The production of potash is a purely post-war industry for France, since the deposits lie in the former German territories. In September, 1925, the production of 26,100 metric tons of crude potash was not far below the equivalent of the average monthly production of 29,200 metric tons in the same region in 1913.

The recovery of iron and steel production was one of the most prominent features of present-day French industrial life. In neither of these had the production in the present area of France in 1924 reached the level of the same area in 1913, though substantial progress had been made in that direction. During 1925 operations continued to improve, until in October the yield of steel ingots and castings reached 668,000 metric tons; this compares with only 582,000 metric tons in the average month of 1913 for the combined regions of France and Alsace-Lorraine. Pig iron production in the same month of 1925 reached 739,300 metric tons, only slightly below the 1913 average of 750,000 metric tons.

Statistics available did not permit a comprehensive comparison of the results of operations in textiles during 1913 and 1925, but the general indications were that present production lags behind pre-war. In cotton spinning, activity had shown a steady upward tendency since 1922, though the average spindle production in September, 1925, was only 2.016 kilos as compared with 3.277 kilos in December, 1913. In cotton weaving the same tendency was noted, with an average production per loom of 5.72 pieces of 100 meters in September, 1925, as compared with 7.70 pieces in May, 1924. Silk and wool manufactures show a recent favorable development. Conditioned wool at Roubaix-Tourcoing during 1910-13 averaged 7796 metric tons per month, but fell to only half that amount in 1921. The monthly average in 1924, however, advanced to 7583, and in September, 1925, reached 8056 metric tons. Conditioned silk at Lyon, which in 1913 amounted to 700 metric tons per month, in 1921 had fallen to less than half that amount but rose subsequently to 586 tons in September, 1925.

One of the most important tasks of agricultural restoration in France after the war was the replenishment of the depleted stock of cattle,

horses, sheep, and goats. Comparative figures for 1914 and 1924 were given by the French Department of Agriculture as follows: Horses, 1914, 3,220,080, 1924, 2,859,400; cattle, 1914, 14,787,710, 1924, 14,024,960; sheep, 1914, 16,131,390, 1924, 10,171,250; goats, 1914, 1,434,970, 1924, 1,376,510.

COMMERCE. French trade in 1924 showed a favorable balance for the first time in 19 years. The total value of exports during the year amounted to 41,454,137,000 paper francs, as compared with import values amounting to 40,132,574,000 francs. An analysis of the trade by commodities shows that foodstuffs imports, which greatly increased during the war and the years following, are now practically back to the same level obtaining in 1913, while exports of foodstuffs are slightly greater than before the war. In value, foodstuffs imported before the war exceeded exports by about 1,000,000,000 gold francs. In 1924 the unfavorable balance was almost 5,000,000,000 paper francs, of which 2,000,000,000 francs were attributable to cereal imports and 1,000,000,000 to meat purchases. As compared with 1923, foodstuffs exports show an increase in both weight and value, and imports show an increase in value but a slight decline in weight. The country in late years, as before the war, continues to be dependent on the foreign supply of these commodities for approximately 4,000,000 to 4,300,000 metric tons each year. French authorities are confident that improvement is to be expected in a number of important lines, as the livestock of the country is improved, the sugar industry is reestablished, and the cereal yield has increased through the use of fertilizers.

French imports of raw materials for industry continue to weigh heavily in the trade balance. A fair comparison of the 1924 figures with those of pre-war years cannot be made for this class, because such tonnage as ore shipments into Lorraine no longer figure in French exports, and the Ruhr developments have upset ore exchanges and coal purchases in relation to Germany. In 1924 values of industrial materials imported into France reached 26,138,351,000 francs, as compared with 20,813,966,000 francs in 1923. Exports rose from 9,342,717,000 francs in 1923 to 10,532,625,000 francs in 1924. In the industrial group there was an unfavorable balance of 9,500,000,000 francs in 1923, which rose to over 15,000,000,000 francs in 1924. The most decided weakness of the French foreign trade position is in this group.

In both years purchases of foreign coal contributed to the unfavorable balance by over 3,600,000,000 francs, and there is no prospect in the near future that France can make herself independent of foreign coal supplies. Other items of great importance in this group applied from abroad during 1924 are raw cotton, 3,456,000,000 francs; wool, 3,018,000,000 francs; silks, 1,912,000,000 francs; oil seeds, 1,578,000,000 francs; petroleum, 1,238,000,000 francs; building woods, 852,000,000 francs; copper, 810,000,000 francs; hides and skins, 740,000,000 francs; and iron and steel, 608,000,000 francs. France must continue practically entirely dependent on foreign supplies of copper, and there is little prospect of relief by increased colonial production of the other items mentioned, except in the case of seeds. There were heavier exports of iron and steel, which make up for importations,

and this to a great extent is the case in hides and skins.

The group of items making the most favorable showing was that of manufactured articles. In weight, imports of these items were less in both 1923 and 1924 than in 1913. In value they increased from 4,376,551,000 francs in 1923 to 5,088,432,000 francs in 1924. Exports, on the other hand, increased considerably during 1924 in both weight and value. The weights, excluding parcel-post shipments, were 3,069,291 metric tons in 1923 and 3,608,152 metric tons in 1924. Values rose from 16,238,857,000 francs in 1923 to 24,861,158,000 francs in 1924, or approximately 50 per cent. It is in this group of items that is to be found the explanation of the favorable balance shown by the figures of the year. If a good showing is made in future years it must be due to intensifying the production of manufactured articles. In foodstuffs France cannot expect to be an important exporter and, except in iron and steel and some less important lines, raw material supplies are as a rule less than those already required by the national needs.

According to the *Statesman's Year Book* for 1925, the chief articles of import and export (special trade) were in millions of francs:

<i>Imports</i>		1923	1924
Wine	.....	720.8	904.7
Wool	.....	2,431.1	3,056.0
Cereals	.....	1,657.1	1,911.1
Raw cotton	.....	2,879.7	3,859.7
Coal and coke	.....	3,649.7	3,741.7
Coffee	.....	834.7	1,341.6
Oil seeds and fruits	.....	1,364.0	1,759.5
Sugar	.....	1,061.5	998.1
Petroleum	.....	995.9	1,212.5
Machinery	.....	769.8	870.7
Copper	.....	653.6	866.2
Cast iron and steel	.....	519.5	585.4
Woolen textures	.....	90.7	86.9
Silk	.....	1,336.7	1,888.1
Metal goods	.....	322.6	358.6
<i>Exports</i>		1923	1924
Arms and munitions	.....	116.3	181.1
Textiles, silk	.....	2,083.3	3,019.7
Textiles, cotton	.....	1,445.6	2,522.6
Wine	.....	606.9	885.1
Raw silk and yarn	.....	303.1	304.9
Soaps and perfumes	.....	336.9	513.4
Iron and steel	.....	1,425.1	1,405.9
Pearls	.....	1,180.6	1,785.9
Automobiles	.....	813.2	1,512.7
Chemical products	.....	570.5	802.2
Glass	.....	145.1	216.2
Clothing	.....	2,067.0	3,254.7
Rubber goods	.....	605.6	814.9
Table fruits	.....	344.2	499.7
Salted fish	.....	195.2	182.9

The chief exports for home use and exports of home goods were to and from the following countries in thousands of francs:

<i>Imports</i>		1923	1924
<i>Countries</i>			
United Kingdom	.....	5,275,377	4,961,647
Germany	.....	1,051,243	2,015,038
Belgium	.....	2,408,551	2,655,934
Switzerland	.....	623,439	665,327
Spain	.....	607,558	836,817
Italy	.....	1,225,931	1,510,021
United States	.....	5,055,596	5,749,615
Brazil	.....	693,025	1,060,595
Argentina	.....	1,271,608	1,814,260
<i>Exports</i>		1923	1924
<i>Countries</i>			
United Kingdom	.....	6,147,852	7,817,962
Germany	.....	1,080,671	3,773,198
Belgium	.....	5,795,549	7,114,496

<i>Exports</i>		1923	1924
<i>Countries</i>			
Switzerland	.....	2,113,011	2,612,791
Spain	.....	908,570	1,157,896
Italy	.....	1,181,525	1,478,742
United States	.....	2,496,363	3,143,763
Brazil	.....	352,478	868,080
Argentina	.....	613,322	696,361

RECONSTRUCTION. According to the United States Bureau of Foreign and Domestic Commerce, the rapidity with which the devastated regions of France have been restored to economic production has generally exceeded expectations. The relatively heavy treasury outlay for restoration purposes regardless of its fiscal reaction, has had the advantage of providing work for the local population and has inspired a lively demand throughout France for transient labor and for materials. Not only have the invaded provinces greatly profited by the prompt action of the government for their restoration, but business conditions throughout France have been kept favorable in no small degree because of reconstruction activities.

As a consequence of the prompt assistance given, the people have been enabled to return to their homes, and those northern regions of France have reestablished themselves as that portion of the country is not only self-sustaining, but yields the most satisfactory increase. In fact, the small growth in population which French statistics show is now occurring is in very large degree due to births in the devastated regions and in the three departments formed from Alsace-Lorraine, which were returned to France as a result of the war. Statistics for 1924 show an excess of births over deaths of 72,216. In the 10 devastated departments the excess of births over deaths was 44,771, or 62 per cent of the total, notwithstanding the fact that these departments represent only 15 per cent of the population. If these areas be considered with Alsace and Lorraine, the excess of births becomes 58,418 in these regions, or 80.8 per cent of the increase for all France, though only 19 per cent of the population is included in these provinces.

The recovery of the invaded area is further indicated by the steady rise in the amount of taxes which they have turned into the public treasury since 1918 as shown by the following figures of "taxes paid by the 10 devastated Departments of France":

1919	.....	1,091,000,000
1920	.....	2,227,000,000
1921	.....	2,271,000,000
1922	.....	2,896,000,000
1923	.....	3,722,000,000
1924	.....	5,400,000,000

These figures do not represent all the payments made, for they do not include payments by companies which make their tax returns at their home offices outside the devastated regions, though they carry on their business within them. Even on the basis of the figures quoted, however, the devastated regions must be credited with nearly one-fifth of all the taxes paid by the entire nation.

While the expenditures for reparations have recreated the industrial equipment of the northern provinces and have during the years since the war helped to keep the country at a high

degree of economic activity, it is, of course, true that this activity has been in some degree artificial. It has been made possible also by greatly adding to the obligations of the government, which obligations must later be paid off. Now that the reconstruction approaches its end, the industrial activity which it directly involved also terminates. In the immediate future therefore, it is not to be expected that the high demand for labor and materials which has characterized the reconstruction activity will continue. The transition from the exceptional operations of the post-war period to industrial operations dependent on the general world market is one involving difficulties not yet fully apparent. In addition, in 1925 the financial difficulties of the government had become such that it could not complete the work of reconstruction as rapidly as had been planned. Recent developments therefore made prospects in the devastated regions less favorable than they had been in the immediate past, whether judged from the point of view of assured local economic activity or from the point of view of those who have still to rely on the government to complete the payment of indemnities. The local economic activity must rely increasingly on the development of the domestic and world markets and less on the work of rebuilding the industrial equipment of the country. Obviously the degree to which the government will be able to carry on the payment of indemnity claims depends on the solution of the difficult problems which already confront it.

**FINANCE.** French government revenues from all sources of taxation amounted to 4,135,000,000 francs in 1913; 8,508,000,000 francs in 1919; 13,247,000,000 francs in 1920; and 25,510,000,000 francs in 1924. The five most productive forms of taxation during the year 1924 were, in order: Direct taxes, registration taxes, luxury tax, and business turnover tax, indirect taxes, and monopolies. The first named, which totaled 634,000,000 francs in 1913, fell off during the war period down to the year 1916, but rose steadily thereafter until in 1924 it amounted to 5,807,000,000 francs. Registration taxes followed the same movement as the direct taxes, dropping in value between 1913 and 1915, and thereafter yielding regularly increasing returns. In 1924 the amount turned into the treasury from this source reached the sum of 4,606,000,000 francs. Not only was the increase in the direct taxes between 1913 and 1924 nominally greater than the collections from all sources in 1913, but this 1913 total of 4,135,000,000 francs was less than the 1924 revenue derived from the registration taxes alone.

The business-turnover tax, now third in importance among the sources of revenue, did not exist before 1920. It then brought 942,000,000 francs, but in 1924, due to better enforcement and greater receipts, yielded 4,110,000,000 francs. In 1913 indirect taxes ranked after registration and customs returns as a source of national income. Since the closing years of the war, however, they have increased greatly in value, reaching a total of 3,965,000,000 in 1924, or more than twice the yield of customs in the same year. Incidentally, customs returns, which yielded over 17 per cent of the total income in 1913, accounted for merely 6 per cent in 1924. The monopoly returns, which amounted to 611,000,000 francs in 1913, dropped in the first year

of the war, but rose subsequently to a total of 2,252,000,000 francs in 1924.

Estimates of the pre-war French national income put the total for 1913 at about 35,870,000,000 francs. In the absence of satisfactory estimates for the present income of individuals in France, studies made in connection with the budget of 1925 indicate that the national income has not risen in proportion to the fall in the value of the franc, and the income for 1924 may be estimated at about 125,500,000,000 paper francs. On this basis the tax burden in 1913 represented about 11.6 per cent of the national income, and in 1924 about 20 per cent. Calculating the population in 1913 as 39,500,000, it is found that for the year 1914 the per capita tax was 104 francs (gold). Considering the 1921 population estimate of 39,200,000 as being approximately the same in 1924, the per capita tax is about 650 paper francs, or 177 gold francs.

According to the *Statesman's Year Book* for 1925 the budgetary estimates for 1924 and 1925 in francs were as follows:

	Revenue	
	1924	1925
Taxes .....	17,101,602,616	25,620,742,554
Monopolies and State		
Industries .....	1,997,878,290	2,727,477,124
State Domains .....	236,222,400	325,584,000
Various .....	1,068,819,526	1,442,276,498
Exceptional Revenues ..	3,025,000,000	1,450,000,000
Revenue from Algeria ..	10,332,000	11,545,000
Reparations .....		1,275,470,100
Total .....	23,437,954,832	32,853,095,276
	Expenditure	
	1924	1925
Public Debt .....	1,200,800,000	17,804,519,412
Military and Naval .....	4,509,776,396	5,168,922,867
Finance .....	1,827,643,209	2,949,655,404
Education .....	1,587,978,575	1,850,007,037
Foreign Affairs .....	132,455,053	131,916,007
Labor .....	551,336,206	670,075,180
Agriculture .....	177,421,905	198,356,023
Public Works .....	1,157,643,981	1,523,811,855
Colonies .....	285,916,717	242,331,948
Total (including all items) .....	23,812,961,341	32,814,926,371

The following table from the same source shows how the debt of France stood on Dec. 31, 1923, in millions of francs:

	Dec. 31, 1923 Millions of francs
Internal Debt:	
8 per cent rentes .....	19,740
5 per cent rentes .....	19,191
4 per cent rentes, 1917 .....	9,118
4 per cent rentes, 1918 .....	20,958
6 per cent rentes, 1920 .....	27,435
Amortizable 5 per cent rentes .....	11,227
Amortizable 3 per cent rentes .....	2,840
Amortizable 3½ per cent rentes .....	12
National Defense Obligations .....	12,978
Obligations of the Eastern Railway .....	1,277
Other debts .....	19,004
Total of long-dated debts .....	143,775
Short-dated debts (2 to 10 years) .....	39,975
Total of floating debt .....	63,658
Advances by the Bank of France .....	28,800
Total internal debt .....	270,708
External Debt:	
Fixed debt .....	21,581
Floating debt .....	17,213
Total external debt .....	38,794
Grand total .....	309,502

**SHIPPING.** For 1924 the shipping in foreign trade and its distribution among French ports is shown in the following table for vessels with cargoes, taken from the *Statesman's Year Book* for 1925:

	Entered (1924)		Cleared (1924)	
	Vessels	Tonnage	Vessels	Tonnage
French .....	9,112	12,411,031	7,099	8,806,267
Foreign .....	18,966	30,164,368	13,577	23,837,897
<b>Total ....</b>	<b>28,078</b>	<b>42,575,399</b>	<b>20,676</b>	<b>32,643,664</b>
Marseilles .....	4,085	9,037,058	3,699	8,153,855
Le Havre .....	2,396	4,652,912	1,625	3,611,733
Cherbourg .....	1,132	9,966,366	1,077	9,868,147
Bordeaux .....	1,541	2,249,047	1,116	1,368,881
Boulogne .....	2,120	2,226,233	2,001	2,060,135
Dunkirk .....	1,913	2,797,526	1,353	2,043,110

St. Nazaire .....	412	732,743	180	316,591
La Rochelle .....	321	911,630	119	477,000
Dieppe .....	1,407	793,565	1,190	587,831
Cette .....	782	600,225	636	478,424
Caen .....	674	441,034	286	184,705

The total traffic borne on rivers and canals of France during 1924 amounted to 36,257,910 metric tons, an increase of 8½ per cent over the 33,883,843 metric tons handled in 1923.

**RAILWAYS.** The length of the principal lines open for traffic in 1924 was 25,808 miles divided as follows: State, 5610 miles; Nord, 2374 miles; Est, 3116 miles; Paris-Orléans, 4630 miles; Paris-Lyons-Mediterranean, 6064 miles; Midi, 2608 miles; Alsace-Lorraine, 1402 miles.

**ARMY.** The army is divided into two forces, the metropolitan and colonial both under the war ministry. There are three divisions of the metropolitan forces: the active army, reserves, and territorial army. The active metropolitan army on a peace basis in 1924 numbered 421,159, inclusive of an air force of 31,396. Service in this army is compulsory but liberal exceptions are allowed. Enlistments are regulated by the law of Apr. 1, 1923. In November, 1924, a plan was adopted to reduce the service in the active army to one year. The colonial army is distinct from the metropolitan army and is made up partly of white troops and partly of colored troops. In 1924 the white troops numbered 39,988, the Foreign Legion numbered 10,000 and the colored troops 188,963, making with the metropolitan army a total peace establishment of 660,110; 65,588 of the colored troops were stationed in France and on the Rhine. The reserves and the territorial army are divided into units corresponding to those of the active metropolitan army. The gendarmerie, a police force recruited from the army but concerned with civil functions, numbered 21,700 in 1923. See **MILITARY PROGRESS.**

**NAVY.** For an account of naval conditions in France, see **NAVAL PROGRESS.**

**GOVERNMENT.** Under the present constitution, the president is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a parliament, or National Assembly, composed of a Senate and a Chamber of Deputies. The president, elected by the National Assembly by an absolute majority of votes for seven years, chooses his own cabinet; ordinarily, but not of necessity, selecting from among the members of the two chambers. The Senate is made up of 314 members aged not less than forty years, and elected by delegates for

nine years; the Chamber of Deputies is made up of 580 members elected by direct popular vote for four years.

The President of the republic at the beginning of the year was Gaston Doumergue, elected June 13, 1924. The ministry appointed June 14, 1924, was made up as follows: Prime Minister and Minister of Foreign Affairs, Edouard Herriot; Interior, Camille Chautemps; War, General Nollet; Marine, M. J. L. Dumesnil; Finance, M. Etienne Clémentel; Colonies, M. Daladier; Public Instruction and Fine Arts, François Albert; Public Works, Victor Peytral; Commerce, M. Raynaldy; Agriculture, M. Queuille; Labor, Hygiene, Assistance, and Social Provision, Justin Godart; Liberated Territories, M. Dalbiez; Pensions, M. Bovier-Lapierre. The Chamber of Deputies as elected on May 11, 1924, was distributed among the various political parties as follows: Communists, 26; Democrats, 14; Left Radicals, 41; Left Republican Democrats, 43; Socialists, 105; Radicals and Radical Socialists, 140; Republican Socialists and French Socialists, 42; Republicans of the Left, 36; Democratic Republican Union, 103; Independents, 30. In the Senate the distribution as a result of the elections of Jan. 11, 1924, was as follows: Democratic Left, 157; Republican Union, 88; Republican Left, 30; Right, 10; Democratic and Radical Union, 23; Independents, 6.

## HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** The Herriot ministry faced several problems at the beginning of the year that were fraught with danger for his premiership. The chief, of course, was the financial situation. The debt to the United States was discussed in and out of parliament with Premier Herriot making this formal speech before parliament on January 28: "I repeat solemnly what has been said by M. Viviani and M. Poincaré—that France does not intend to disavow her debts. The government over which I preside, devoted as it is to respect for treaties and agreements, will not disavow debts which France has contracted." On February 2 President Doumergue virtually repeated Premier Herriot's statement to the effect that France would pay her debts. He added, however, "that so long as our security is not fully, definitely assured, France will be paralyzed in her capacity for constructive, beneficent work. It is therefore impossible to dispense with guarantees of security." The uncertainty of the financial situation was clearly reflected in the fluctuations of the franc. The exchange value rapidly fell and the Bank of France was compelled to issue paper money in excess of the amount prescribed by law. Although it was stated in the French press that the low value of the franc was entirely due to manipulation on the money exchanges of foreign countries, there was sufficient evidence produced to show that French people were doing everything in their power to liquidate their securities and get their money invested in foreign countries in order to evade any radical taxation that the Socialists might enact to save the situation.

The steady inflation of the currency was reflected, of course, in the rise of prices, but not necessarily in the increase in wages. In the middle of February the Herriot government announced that it had abandoned the new tax

on corporation earnings, largely because of the export of French capital and the uneasy position of the Frenchmen who were afraid of its effect on business. This move on the part of Herriot greatly weakened his hold on the Chamber. He was unable to repeal the taxes of the Poincaré government as he had promised to do and was actually compelled to impose more taxes, but was unable to suggest those that the Socialists demanded. Just at the time that the financial situation was at its worst Joseph Caillaux, following his legal reinstatement, appeared again in public life. Some elements of the press stated that he had timed his public appearance so as to call to the attention of the country the pressing need for a financier of vast experience and understanding who would be able to steer France along the tortuous roads that led to financial rehabilitation and a balanced budget.

The struggle with the Vatican, which was discussed in the preceding YEAR BOOK, continued into the first two months of the year. On Jan. 19, the Chamber debated the question of the abolition of the French Embassy at the Vatican. Henry Simon, a government speaker, spoke for the measure and in a bitter speech accused the Vatican of being pro-German during the war, "because the Pope did not believe in French success, and when one does not believe in success it is almost the same thing as desiring failure." The conservatives and even some of the Premier's own followers (including Aristide Briand) asked him not to break entirely with the Holy See but Herriot replied, "We have nothing to lose. Every nation is free and we do not have to receive orders from the Pope." Herriot made one concession when he stated on January 26 that the old relations between the Pope and Alsace-Lorraine would be continued for the present. On February 2, the Chamber by a vote of 315 to 250 agreed to Herriot's proposal to abolish the Vatican Embassy. The separation between the church and state was now complete as far as France was concerned with the exception of Alsace-Lorraine where the *status quo* continued.

Herriot lost favor with many of his followers because of his rather nationalistic attitude toward Germany. In a speech on January 28 he issued a warning to Germany to the effect that Germany had not physically or even morally disarmed and that the situation in Bavaria was one of menace to the peace and security of France. The Socialist deputies called him to task for this speech but he mastered the situation by telling them that he was ready to give up his premiership but would not sacrifice the military security of the country for any uncertain schemes of disarmament. He further said that if his government fell the party would virtually lose their leadership in national affairs. He completely won them over and a short time later was given a 541 to 32 vote of confidence. Premier Herriot was apparently dissatisfied with the results of the recognition of Soviet Russia. He and President Doumergue told the Soviet Ambassador, M. Krassin that "Soviet tactics were becoming intolerable." The press was open in its accusation, that despite promises to the contrary, the Soviet government was carrying on propaganda in France and that the headquarters of such propaganda was in the Russian Embassy at Paris.

FALL OF THE HERRIOT MINISTRY. The finan-

cial situation of France finally encompassed the downfall of the Herriot ministry. The budget for 1925 as passed by the Chamber of Deputies provided for the expenditure of about 34,000,000,000 francs. The Senate, under the leadership of Henri Bérenger, made a minute investigation of the measure largely in the interests of economy and recommended certain changes which were unsatisfactory to the ministerial bloc in the Chamber. The Premier refused to accept all the reductions made by the Senate. In the face of the unstable currency situation it was rumored that the government planned to exceed the legal note issue of 41,000,000,000 francs allowed to the Bank of France. On April 2, however, the government issued the following statement: "The Cabinet Council has examined the increased credits which the Ministers plan to ask during the discussion of the budget by the Senate, and which will be limited to incompressible necessities of their departments. Faithful to the declaration it has made to ask no inflation for the needs of the State and to remain within the legal limits for advances from the Bank of France to the Treasury, the Government has examined the measures it will propose to meet the present needs of commerce without failing in its undertaking." Despite this assertion, Finance Minister Clémentel appeared before the Senate and stated that the government was planning to exceed the Bank's legal issue of notes in order to meet the needs of the country. Although this statement was unauthorized by the government and Herriot did everything possible to retract it, the ministry lost the confidence of the Senate. Clémentel resigned the same night and was replaced by Senator Anatole de Monzie.

The financial scheme of the government was placed before the Chamber on April 7, with a substitute for the capital levy which the majority bloc was so anxious to see consummated. The substitution was in the form of a consolidated loan which was intended to borrow 10 per cent of the wealth of the country. The loan was virtually mandatory. The government plan also called for an increase in the amount of money the Bank of France could issue from 41,000,000,000 to 45,000,000,000 francs and an advance in the amount the Bank could advance to the State from 22,000,000,000 to 26,000,000,000 francs. It was on the question of the further inflation of the currency that Herriot fell on April 10. The Senate refused him a vote of confidence on the inflation issue by 156 votes to 132. Herriot immediately presented his and the cabinet's resignation to President Doumergue.

PAINLEVÉ MINISTRY. President Doumergue asked Paul Painlevé to form a cabinet on April 10. He at first refused, but when the President requested Aristide Briand to form one and he was unable to do so, Painlevé accepted the responsibility and announced the following ministry on April 17: Premier and Minister of War, Paul Painlevé; Vice Premier and Minister of Justice, Jules Steeg; Foreign Affairs, Aristide Briand; Finance, Joseph Caillaux; Interior, A. Schrameck; Marine, Émile Borel; Commerce, Charles Chaumet; Colonies, André Hesse; Labor, Antoine Durafour; Education, Anatole de Monzie; Public Works, Pierre Laval; Agriculture, Jean Duran; Pensions, Louis Antériou. Practically all these ministers belonged to the Radical Socialists and Radical and Left Radical

parties. There was some opposition in the press to the selection of Caillaux to the position of finance minister because of his war record, but, on the other hand, it was felt that the financial needs of the country demanded a man of his undoubted ability to meet the situation. He was severely attacked in the Chamber and the Senate by the Nationalist members. Herriot was elected to the presidency of the Chamber, the position given up by his successor to the premiership.

The Painlevé ministry announced shortly after its formation that the embassy at the Vatican was to be continued and thus settled for the time being a problem that had disrupted the country for months. It shortly faced a task, however, which was to seriously imperil its position. This was the war with the tribesmen of Morocco. (See MOROCCO.) The Communists and Radicals severely criticized the government for its vigorous campaigns against the Riffs and stated in no uncertain tones that a war would not be supported by them. Premier Painlevé said time and time again that it was purely a defensive war, but he was often compelled to rely upon the vote of the opposition for his support when the Moroccan question was discussed. The Opposition preferred to support him on this issue rather than go through the disturbance of forming a new ministry.

**CAILLAUX'S FINANCIAL PLANS.** Toward the end of June the Chamber and the Senate approved plans made by Caillaux for the stabilization of the financial situation. The chief feature of the bill was the issue of six billion paper francs, thus increasing the amount issued within three to ten billion francs. In support of his measure Caillaux said: "This is no time for sensational measures. We are resting within the limits of normal, natural procedure, which, however, does not exclude audacity. But audacity requires confidence, and I am fully confident that the country, eager to recuperate and extricate itself from the morass and re-establish itself, will respond to the appeal made to it by the Government." He stated that the new issue was not exactly inflation because the new money would be used to meet bonds which were about to fall due. The radicals in the chamber proposed the capital levy as a cure for the financial ills but were unable to get the support of the majority. In July the parliament passed a bill which placed a heavy penalty upon the export of French capital and which granted amnesty from taxation to any capital, which had been illegally deported, which would be repatriated by Jan. 1, 1926.

**DOWNFALL OF CAILLAUX.** Parliament recessed during the summer to meet again in October. In the meantime Caillaux had gone to the United States and was unsuccessful in his attempt to negotiate a settlement of France's debt to that country. (See UNITED STATES.) His failure along these lines undoubtedly weakened his position at home. His downfall came about, however, because of the demand for a capital levy, which he refused to accede to. He offered as a foil to this panacea the refunding of the internal debt and a further inflation of the currency. The other cabinet members intimated that he should resign before the meeting of parliament but he stubbornly refused to do so. In order to get rid of him the Painlevé cabinet resigned on October 27. Two days later Painlevé formed

a new cabinet which did not include the "stormy petrel of French politics." It was made up as follows: Premier and Minister of Finance, Paul Painlevé; Foreign Affairs, Aristide Briand; Justice, Camille Chautemps; Interior, A. Schrameck; Public Works, Anatole de Monzie; War, Edouard Daladier; Marine, Emile Borel; Commerce, Daniel Vincent; Agriculture, Jean Durand; Public Instruction, Yvon Delbos; Colonies, Leon Perrier; Labor, Antoine Durafour; Pensions, Louis Antierou; Budget (tentative), Georges Bonnet. Opinion seemed to be unanimous in feeling that the reconstructed ministry could not hold the confidence of the Chamber or Senate for any length of time. The Premier himself appeared to desire to hold office merely long enough to have the Locarno treaties ratified and the Syrian and Moroccan situations cleared up. On November 11, the Premier stated that he was ready to adopt the programme of the Left bloc and would support a proposal to enforce a capital levy. He was virtually forced to this decision when his own plan for a huge increase in taxation was defeated. At the time he made his concession, however, it appeared certain that the Senate would reject any such move.

**FALL OF THE PAINLEVÉ MINISTRY.** On November 22, Paul Painlevé resigned the premiership. His ship of state foundered on the rocks of French finances as Herriot's had before him. On November 17 he introduced his drastic taxation measure and along with it a proposition to defer payment on certain obligations which fell due on December 8, and to further increase the inflation of the currency. The Socialist bloc demanded that the further inflation be limited to 1,500,000,000 francs. To this Painlevé was unable to agree and consequently he handed in his resignation. The task of forming a new ministry was intrusted to Aristide Briand and on November 27 he became premier for the eighth time. His cabinet was constituted as follows: Premier and Minister of Foreign Affairs, Aristide Briand; Justice, René Renoult; Interior, Camille Chautemps; Finance, Louis Loucheur; War, Paul Painlevé; Marine, Georges Leygues; Education, Edouard Daladier; Public Works, Anatole de Monzie; Commerce, Daniel Vincent; Agriculture, Jean Durand; Labor, Antoine Durafour; Pensions, Paul Jourdain; Colonies, Leon Perrier.

Before Briand was successful in forming his cabinet the position of premier was offered to both Paul Doumer and Edouard Herriot, but both were thwarted in their attempts by the Radical bloc. Briand smashed this bloc when he formed his group and for the first time in 1925 a fairly moderate group was in control of the affairs of France. The first real test of the new government came in the first week of December. Once again it was over the question of finances. Loucheur proposed a 10 per cent levy on capital to be paid in thirty installments. He also introduced a bill authorizing the further issue of 7,500,000,000 francs to meet outstanding obligations. He met the argument that this was inflation but repeating Caillaux's old argument that the issue was to meet the debts of France and therefore the total indebtedness of the country was not being increased. This measure passed the Chamber by a vote of 245 to 239 and the Senate by a vote of 196 to 59. Thus by six votes was the cabinet sustained.

**FRANCO-AMERICAN EXCHANGE SCHOLARSHIPS AND FELLOWSHIPS.** See **UNIVERSITIES AND COLLEGES.**

**FREE BAPTISTS.** See **BAPTISTS, FREE.**

**FREEMAN, MILTON H.** American Civil Engineer, chief engineer of the New York & New Jersey Bridge & Tunnel Commission in charge of the construction of the Hudson River vehicle tunnel, died March 24 at Valhalla, N. Y. Born at Crary Mills, St. Lawrence County, N. Y., Oct. 12, 1871, he graduated from the Potsdam Normal School and after teaching entered the University of Michigan in 1899 where he studied civil engineering. After two years with the Michigan Central Railroad, he served, 1905-09, as inspector and assistant engineer of the Pennsylvania East River tunnels. He then joined the engineering staff of the Catskill Aqueduct and was field engineer of the Rondout Siphon tunnel where he was particularly successful in concrete construction and grouting. In 1919 he was made resident engineer of the Old Slip rapid transit tunnel under the East River and later took charge of the 60th Street rapid-transit tunnel and of shaft work on the 14th Street tunnel. In 1919 Freeman was selected by Clifford M. Holland, chief engineer, as one of his lieutenants for the design and construction of the Hudson River vehicle tunnel. In 1920 Freeman received charge of field operations. At Holland's death he was appointed chief engineer, Dec. 1, 1924. Freeman was one of the foremost engineers in sub-aqueous tunnel construction.

**FRENCH, FIELD-MARSHAL JOHN DENTON PINKSTONE,** First Earl of Ypres. A British soldier, died May 22. He was born at Ripple Vale, Kent, Sept. 28, 1852. Joining H. M. S. *Britannia* in 1866, he served as cadet and midshipman in the British Navy for 4 years. In 1874 he entered the 8th Hussars. With the 19th Hussars, he served in the Soudan campaign of 1884-85. He commanded the 19th Hussars, 1889-93, then becoming for a year assistant adjutant-general of cavalry on the staff, when he was appointed assistant adjutant-general at headquarters of the army, where he served until 1897. In this year he was appointed brigadier-general to command the 2nd cavalry brigade. He served as temporary major-general with the 1st cavalry brigade at Aldershot in 1899. In the South African War, 1900-02 he commanded the cavalry in Natal, in the relief of Kimberley in February, 1900, and the capture of Bloemfontein and Pretoria. In 1907 he became general commanding the 1st army corps. In 1913 he was made field marshal. He served as chief of the Imperial General Staff 1911-14, and inspector-general of the forces. In 1914 he commanded the English forces in France from the outbreak of the War until the end of 1915. The British Army, hampered by lack of artillery ammunition, suffered severely. In 1915 he resigned the chief command and, 1915-18, was commander-in-chief of the troops stationed in the United Kingdom, being created in this year Viscount of Ypres and of High Lake. In 1918 he was made Lord Lieutenant of Ireland, serving until 1921. On his return to England he was created 1st Earl of Ypres. He received many honors including O.M.K.P. 1917; K.C.M.G. 1902; G.C.B. 1909; K.C.B. 1900; and G.C.V.O. 1905. He was made D.C.L. by Oxford University, and LL.D. by Cambridge. He had

many honors from European Governments for his services during the War and in 1920 received the Freedom of the City of London and a sword of honor.

**FRENCH CONGO.** See **FRENCH EQUATORIAL AFRICA.**

**FRENCH EQUATORIAL AFRICA.** A French possession in Africa on the Atlantic coast between the territories of Belgian Congo and British Kamerun, comprising the region formerly known as French Congo; stretching northward to the Bahr-el-Ghazel and Lake Chad, and bounded by the Congo and Ubangi rivers in the interior. Area, 982,049 square miles; population, 2,845,936, of whom 2932 were Europeans (Census of 1921). Including the Kamerun territories, the area is 1,048,538 square miles and the population 4,345,936. It comprises the four colonies of Gabon, Middle Congo, Ubangi-Shari, and Chad. The Kamerun territories were ceded to Germany by France in 1911, in return for recognition of the French protectorate in Morocco. They were restored to France by the Treaty of Versailles in June, 1919. The boundary between French Equatorial Africa and the Anglo-Egyptian Sudan was fixed by an agreement signed Feb. 28, 1924.

Equatorial Africa is very rich in natural resources, for the most part undeveloped. There are vast stretches of tropical forests containing valuable timber. Palm oil and wild caoutchouc are the principal commercial products. Coffee is raised to some extent. Livestock includes cattle, sheep, camels, asses, horses, and ostriches. Copper, zinc, and lead are to be found. The total exports in 1923 were valued at 83,039,276 francs and the total imports were valued at 32,420,274 francs. No later figures for the budget are available than those given in the preceding **YEAR BOOK** when the total budget for the colony was 9,358,542 francs. The revenues are made up of import, export, and excise duties, navigation fees, and certain semidirect taxes. For a discussion of the plans for railroad construction in the colony see the **YEAR BOOK** for 1924. The colonies are under a governor-general whose headquarters are at Brazzaville, but each colony is locally governed by a lieutenant-governor, aided by an administrative council. Governor-General at the beginning of 1925, R. Antonetti (appointed in July, 1924).

**FRENCH GUIANA, gè-à-nà, (CAYENNE).** A French colony and penal settlement on the northeast coast of South America. Area, about 34,740 square miles; population, according to the census of 1921, 44,202. Cayenne, a seaport town, is the capital; population, 1921, 10,146. The population figures given above do not include the number in the penal settlement of Maroni or the floating population of miners or French officials or native tribes. No later educational statistics are available than those for 1920-21 when the school population was 2720, exclusive of Maroni, which had 208. The extensive forests are rich in timber of industrial importance. Although agriculture is not engaged in on a large scale, the following products are raised: Cacao, coffee, gutta percha, indigo, maize, manioc, rice, sugar cane, and tobacco. The chief occupation is placer mining for gold. Other minerals produced were silver, iron, and phosphates. The total imports in 1923 amounted to 41,740,540 francs and the ex-

ports to 35,171,091 francs. The chief articles of export were: gold, rosewood essence, various timber, phosphates, cacao, balata, and hides. The budget, which amounts to approximately 7,000,000 francs annually, must be partially met by subsidies from the home government. The colony is under a governor, who is aided by a privy council and by a council-general elected by French citizens in Guiana, and is represented in the French Parliament by one deputy.

**FRENCH GUINEA.** A French colony on the west coast of Africa between Portuguese Guinea and the colony of Sierra Leone. Area, about 92,640 square miles; population in 1923, 2,026,321, including 1885 Europeans of whom 1083 were French. Capital, Conakry. The chief products are palm oil, palm nuts, gum, rubber, millet, rice, and coffee; experiments have been made in the cultivation of bananas, pineapples, rubber trees, etc. In 1923 the live stock included: Cattle, 430,000; sheep, 76,718; goats, 103,817; horses, 2600; and asses, 560. Some gold was found. The imports in 1923 were valued at 57,541,112 francs and the exports at 34,624,798 francs. The chief exports were: Rubber, cattle, ground nuts, hides, wax, wool, and palm-kernels. In 1923, 337 vessels entered and 327 cleared. The budget for 1924 amounted to 16,075,237 francs. The colony is under the governor-general of French West Africa.

**FRENCH INDIA.** The name given to the group of French dependencies in India, of which the chief is Pondichéry. The area of the five colonies is about 196 square miles and the collective population was estimated at 272,427. The five dependencies with their estimated population in that year are as follows: Pondichéry, 174,179; Karikal, 57,023; Chandernagor, 25,125; Mahé, 11,401; Yanaon, 4699. In 1923 the movement of population at Pondichéry was: Births, 3.58 per thousand; deaths, 4.03 per thousand. In 1923 the government maintained 61 primary schools and three colleges, with 310 teachers and 9804 pupils. The budget for 1924 balanced at 2,870,410 rupees. The chief crops are paddy, rice, cotton, sugar, manioc, cacao, coffee, and ground nuts. At Pondichéry there are three cotton mills and at Chandernagor, one jute mill. The imports at the ports of Pondichéry, Karikal, and Mahé, in 1923, amounted to 31,915,984 francs, and the exports to 45,117,383 francs. At these three ports 277 vessels entered and cleared in 1923. French India has 43 miles of railway. The colonies are under a governor whose headquarters are at Pondichéry, and an elective general council; they send one deputy and one senator to the French parliament.

**FRENCH INDO-CHINA.** A region in southeastern Asia, comprising the French colony of Cochin-China and the protectorates of Annam, Cambodia, Tonking, and Laos, as well as Kwang-Chau-Wan, which has been leased from China, and the district around Battambang, which was ceded by Siam. Total area, about 256,878 square miles; population in 1922, 19,983,203. The European inhabitants, exclusive of the military, numbered 17,447. The native Annamites constitute about three-fourths of the population. Capital, Hanoi, with a population of 109,500 in 1919. Other important cities are: Cholon, Bindinh, Saigon, Penom-Penh, Hué, Vieu Tiane, and Haifong. The region of which

Saigon is the centre is chiefly agricultural, being one of the greatest rice producing areas of the world, but fisheries along the coast and along the lakes are of some importance. Haifong is the centre of a region devoted to agriculture, mining, and manufacture. A third district around the port of Tourane produces chiefly cinnamon, sugar, and tea. In 1923 an irrigation system was completed reclaiming 45,000 acres on which two rice crops a year could be produced.

The mineral resources of Indo-China include coal (1,000,000 tons in 1923), zinc, tin, lignite, antimony, and wolfram. The forest reserves of French Indo-China are very important, but suffer from inefficient exploitation. In 1923 the imports totaled 1,494,119,233 francs and the exports, 1,413,053,597 francs. The general budget for 1925 was placed at 76,466,490 piasters (1 piaster equals approximately \$0.55)—an increase of 1,552,810 over 1924. Of this amount 64,602,610 piasters compose the ordinary budget, which derives its revenues from the ordinary receipts, and 11,863,680 piasters the extraordinary budget, provided from the surplus of the government. The ordinary budgets of the five local subdivisions were estimated at 48,978,053 piasters and the extraordinary budgets at 1,519,202 piasters. The reserves of the government on Dec. 31, 1924, amounted to 21,950,000 piasters, a decrease of 32,000,000 during the year. Reserves for the local governments totaled 4,340,000 piasters. An increase was recorded every previous year, due to government control of the exchange rate, the rise in the value of silver, and the heavy excess of receipts over ordinary expenditure. The reduction in 1924 resulted from the use of the reserves for the extraordinary expenses of the government to the extent of 5,384,000 piasters in 1919, 1,022,000 in 1921, 12,080,000 in 1922, 14,880,000 in 1923, and nearly 12,000,000 in 1924.

At the end of 1923 the total length of railway line, about two-thirds of which was owned by the government, was 1286 miles. Indo-China is under a governor-general and a superior council which acts through a permanent commission, and at the head of each state is a resident superior with the exception of Cochin-China, which is directly under the home government. Governor-general at beginning of 1925, Martial Merlin.

**FRENCH IVORY COAST.** See IVORY COAST.

**FRENCH LANGUAGE.** See PHILOLOGY. MODERN.

**FRENCH LITERATURE.** Of special interest is the recent committee created to furnish monthly a "Choix d'ouvrages pour les étrangers"; the members belong to the most varied coteries, e.g. Bédier (French Academy) Pol Neveux (Académie Goncourt), Strowski (Sorbbonne), Jacques Bainville (Action Française), André Maurois, the author of Shelley, etc. The "Comité France-Amérique" continued, of course, its monthly lists. The *Bulletin de la Maison Française* (6 Rue Félibien), and other publications, reproduce these lists which are in general well done. The *Nouvelles Littéraires* (weekly), are well known, but the *Chronique des Lettres Françaises* (bi-monthly) ought to be much better known in the United States.

It is not only on account of the quantity of books published that such help is useful, but for two other reasons: The commercialization

of literature, which means that the success of a book depends so much on advertisement; an intelligent selection must be opposed to the selection by money (see the satire on this commercialism in F. Divoire, *Cours de stratégie littéraire*); the second reason is the anarchy of thought now prevailing in literature; this anarchy manifests itself in attacks against all that has been in any form commended yesterday,—the unrelenting attacks against Anatole France ever since he died one year ago are a good example; the worst were *Un cadavre*, by Philippe Soupault and his friends and René Johannet's *A. France est-il un grand écrivain?* Moreover the only constructive (?) movement on foot is one that sets dreaming as the standard of sound thought, the school of the "Sur-réalistes" whose manifesto was written over one year ago by André Breton in *Le poisson soluble* (the author must just listen to the "dictée de la pensée, en l'absence de tout contrôle exercé par la raison, en dehors de toute préoccupation esthétique ou morale"); these young men are the Dadaists of yesterday (see YEAR BOOK for 1924), having just changed the name of their school, and with the beautiful assurance of ignorance proclaim as *New gospel* the theory of the unconscious which has been commonplace ever since the days of Schopenhauer, of Ribot, Wundt, psychology in general, of the Symbolists ever since 1885, etc. Speaking of lack of clear vision in present-day literature we might mention here also Barbusse's new book, *Les enchaînements* (Fetters) in which once more, as in his *Clarté*, he advocates anarchy as the solution of the world's evils. . . . Only, the world tasting of anarchy more than enough since the War is no longer listening to Barbusse.

POETRY. For detailed information reference should be made to the special journal for poets, *La muse française* (ed. by Garnier) and to the monthly articles in the *Mercure de France*. The American reader will become acquainted with recent poets in *Anthologie de la Nouvelle Poésie française* (publ. by Kra; poems by Apollinaire, Carco, Larbaud, Péguy, Toulet, Valéry, Max Jacob, Tzara, etc.). Of a more orthodox character is A. Boschot's *Chez les poètes français* (Plon). Timely is A. Droin's *Paul Valéry et la tradition poétique* (Flammarion). The most important reward in the domain of poetry was the Prix Virenque (3000 francs) which went to Louis Mercier for his *Petites Géorgiques*.

Probably the most important event of the year was the publication of Charles Maurras's *La Musique intérieure* (Grasset) which ran into numerous editions. The famous journalist explains how he was carried off from his real vocation as a poet to political life, and also how he followed in his youth false idols neglecting the real great poet of France in our days, Moréas, "l'Athénien, honneur des Gaules"; it is brimming with suggestive thoughts on the much discussed subject of rhythm; the end of the volume is made up of selections of the poetry by the author, especially some stirring stanzas on the "Battle of the Marne." Fr. Jammes publishes a new *Livre des Quatrains* (and had an imitator in Ad. Guégan, *Trois petits tours et puis s'en vont* . . . which is a volume of tercets). L. le Cardonnell has a new collection of poems *De l'une à l'autre aurore*.

De Poucheville, a friend of Verhaeren, proves also a worthy disciple in his *Nord et Midi, poèmes* on varied subjects, several on historic events, and a longer poem on a modern Madame Bovary. Ernest Prevost (Grand Prix de poésie 1924) gives *L'Hosanna des Quatre saisons*, poems of fine inspiration.

Other volumes with a distinctly idealistic trend are: G. Rollin, *Casques d'azur*; M. Cail-lard, *Barque aux souvenirs*; Lelec, *Messe du soir*; J. B. Magnier, *L'éternelle bataille*; Louis Pize, *Les Muses champêtres*; etc. J. Gausseron is hailed as a very promising new poet, in *Voix lointaines*; M. d'Auberlieu, in *Sur le seuil* evokes the dead of the War. Among what may be called the radical younger poets, let us mention the (posthumous) *Les joutes en feu*, by R. Radiguet, and J. Cocteau's *Poésies*; but chiefly Robert de Laissières, whose short poems in *Le Labyrinthe* forced the attention of the critics; the names of Baudelaire, and Rimbaud were recalled by his unusual lyricism.

A lively literary quarrel followed a discourse on *poésie pure*, by Abbé Bremond, at the meeting of the five Academies, on Oct. 24. Paul Souday of *Le Temps* (Nov. 2) objected to a too mystic attitude; Bremond answered in *Nouvelles littéraires*, and . . . the discussion still goes on.

THEATRE. If this was not a year for an undisputed triumph for any one author, it was one for the triumph of one subject: no less than three plays were given having Joan of Arc as the heroine; one was the translation of Bernard Shaw's (which had a very good run in Paris), the second was the long awaited (but not entirely successful) *Vierge au Grand cœur*, by F. Porché; the third was the play by the American, Mercedes de Acosta, with Eva Le Gallienne in the title rôle, and which interested chiefly by its sumptuous staging.

The number of plays betraying unusual talent were not few: First some by veterans of the stage: *Seigneur Polichinelle*, by M. Zama-cois, the author of the *Buffons*; Maurice Donnay, *Un Homme léger*; de Flers et Croisset, *Les Nouveaux Messieurs*—meaning the men in power to-day; these authors are, so to speak, proof against failure. The same might almost be said of Géraudy who offered one of the successful plays at the Comédie Française, *Robert et Marianne*,—once more the theme of *Toi et Moi*, the frailty of love after the great hours of passion have passed. Kistemaekers in *La Nuit est à nous* has what was called "un drame échevelé" in the automobile world, and some are wondering whether it is drama or comedy. Edmond Fleg, the witty author of *La Maison du Berger* (the prototype of *Abie's Irish Rose*) prepared an elaborate spectacle given by Pitoëff, in 12 Tableaux: *Le Juif du Pape* which made many think of the Locarno Conference: the Pope and the Jew Salomon Molco, in 1523, came near arranging for a perpetual truce among the nations of the earth, but their efforts were frustrated by petty intrigues. Sacha Guitry has two plays: *On ne joue pas pour s'amuser*, and *Mozart*. From Abel Hermant's novel *La Discorde*, de Zogreb made a play which reminds one more or less of the tragedy of P. L. Courier's death, possibly at the hand of his wife, and the centenary of Courier having been commemorated recently gave added interest to the play. The titles indicate the nature of *La Tornade* by

Baldy, and of *La Tourmente* by Wachthausen et Rouillard. The Odéon gave once more part of his programme over to foreign writers: Florence Barclay provided the story for A. Bissou's *Le Rosaire*; the new play of the Danish authoress, Mme Karen Bramson, (who two years ago was much praised for *Professor Klenov*), and which is called *Les yeux qui s'ouvrent* was judged a little too misty or Ibsenian.

The comedy success of the year undoubtedly was de Lorde and Pierre Chainé's *Mon Curé chez les Riches*, taken from Vautel's famous novel of the same name. Tristan Bernard scored in *Prince Charmant*; Verneuil et Berr in *Le mariage de Maman*—which reminds one much of Capus's style; L. Marchand, *Mon Gosse de Père* shows amusingly how a boy brought up in America comes back to his father and educates him into a very business-like existence. Rivoire et Veber made *Monsieur Beaucaire* into a lively comic opera; and the taste for the music play in the American style was further indicated by the success of Gignoux et Colline's *Agnès et son chat*. Maurice Rostand failed (at the Comédie française) with *La Nuit des Amants*, even more than in *L'Archange*, in which he represented the famous aviator Guynemer (the family of the latter objected strongly). Many are the clever plays of the Boulevard theatres picturing what quite a number of people believe to be the typical Parisian life; Birabeau's *Le déjeuner au soleil*, or Praxy's *Le mensonge à la page* or again Savoir's (the author of the *Eighth Wife of Bluebeard* given so long in New York) *Un homme*. Original was the attempt by Nozière et P. Humble to put on the stage *La famille Fenouillard*, the amusing adventures drawn in the *Albums* by Christophe.

The new generation continued to pour new plays on the public. Paul Demasy put on the stage the novel by MacOrlan, *La Cavalière Elsa*, which had a very long run; Philippe-Fauré Frémiet had another drama of beautiful inspiration *La haute Route*; Pierre Frondaie, author of *L'Insoumise* created a stir with his powerful *La Menace*, which was called by some a Fascist drama (meaning that the Kingdom of Heaven belongs to the violent). Denys Amiel, one of the chief representatives of the "Théâtre du silence" (the characters talking about things entirely indifferent but the audience all the time understands what is passing in their minds) gave two successful plays, *Monsieur et Madame un Tel*, and *L'homme d'un soir*; Jacques Natanson added to his plays *L'infidèle éperdu*, in which again the most subtle emotions are presented with mathematical precision; Jean Sarment is playing himself the chief part in his *Les plus beaux yeux du monde* (Les plus beaux yeux du monde sont ceux qui ne voient pas—because they need not see the ugliness of life); Jean-José Frappa has moved the public greatly by *L'Idée*,—a man who lives to the very end his ideals which are of the loftiest; Bousac de St. Marc tries a philosophical drama in *L'Amour vaincu*; J. J. Bernard gave a touching modern Antigone in *Denise Marette*.

This last play was given at the "Théâtre des Jeunes auteurs," a new institution by which some people in Paris hope to free the stage of the invasion of commercialism; the association has been very well received so far, giving plays by unknown authors as Sterr Passeur, H. Clère,

Ch. R. Marx, G. Marcel—but also by men already known, as Bernard. Another society has been formed with the same end in view, "Théâtre Aide et Protection"; they play in various halls and theatres: Historic plays were given at the Trocadéro, *Huon de Bordeaux* and *Merlin l'enchanté*, by Roudié; also *Simon de Monfort*, by Suberville. Stevenin's *Sang des autres* and G. Humbert's *Fruit défendu* are dramas; R. Genty's *Les amours de Collin Maillard*, is a charming fancy play. The "Atelier," directed by Dullin seems to have definitely taken the place of Copeau's "Vieux Colombier"; a play by a woman, J. Neis, *La lame sourde* seems to have attracted a little attention; Jules Romains gave there a *Demetrios*, in his usual vein of uncertain irony; (he gave also a continuation of his *Trouhadec saisi par la Débauche*, in *La mariée de Trouhadec*, with little success, however.) The boldness of Crommelynck in *Tripes d'or* met with little success this year. The "Compagnons de Notre-Dame" continue to try a revival of the catholic play under the direction of H. Ghéon (in the old rooms of Le Vieux-Colombier); Brochet offered *Le Pauvre qui mourut pour avoir mis des gants*; Ghéon himself revived the old Rotrou play, *Le Comédien et la Grâce*.

NOVELS. In June was awarded the Grand Prix du roman (by the Académie); it went to François Duhourcau, for *L'enfant de la Victoire* (a study of post-war conditions). It belongs to a series of novels which the Academy evidently wishes to encourage and which is under the direction of F. Roz, "Les éditions de la vraie France"; an effort was being made to favor and spread a literature "healthy, vigorous and full of life" and to react against the "invading cynicism" in literature. A number of excellent novels had appeared in the collection, and the undertaking deserved highest praise. In December the Prix Goncourt was awarded to Maurice Genevoix, for *Rabotiot*, an excellent character novel of a poacher in the Province of Sologne.

The novels of the best known authors need be mentioned by title only: H. de Regnier's *Divertissement provincial*—in the usual vein of detachment of the author; G. Giraudoux's *Bella*, about political life in France, (one character is said to be Poincaré); M. A. Leblond, *Amour sur la montagne*; Martin-Chauffier was a very close second in the run for the Grand Prix du roman with *L'Epervier*. J. Lacretelle's *La Bonifas* (a woman who entirely discards her sex in life, lives exactly like a man, shocks everybody, and yet is worthy of admiration) is probably the novel of the year that has claimed most attention. The veteran novelist Marcel Prévost wrote a powerful novel on the right to kill in his *Sa maîtresse et moi*; a terrible indictment of society is given by G. Anquetil's elaborate *Satan conduit le bal, roman pamphlétaire et philosophique des mœurs du temps*; Larrouy, (author of *L'Odyssée d'un transport torpillé*) gives *Coups de roulis*; Ch. Géniaux, *L'Homme de peine*, a novel in Brittany; Ad. Jaloux, *L'Alcyone* is a study of the fashionable world in the Bourget style, but with the discouraged note of the author; *Le coin de Cyprès*, by the same is a sort of modern "éducation sentimentale"; Vaudoyer's *La laide et le sensuel* is in the ordinarily keen style of the author.

Novels discussing the medical profession are always watched with curiosity, as was Duplay's

Nos Médecins; Pierre Benoit once more wrote one of the big sellers *Puits de Jacob* (Zionism problem); and H. Béraud runs close second with *Le capucin gourmand*. There was a sort of a boom in favor of a Swiss author, C. F. Ramuz; in both his books of this year, *L'amour du monde* and *Joie dans le ciel*, he certainly had something "different" from the usual French novelist; he is not easy to read however. Much interest has been shown for L. Bertrand's *Jean Perbal*, and Martial Piéchaud's *La romance à l'étoile*—both studies of men in their twenties; the first seemed to be almost an autobiography; and the author intended to make it the *Jean-Christophe* of a new generation. Above the average level of to-day's novel were also the following which come from even younger men: Fr. Mauriac, *Le désert de l'amour* (very successful); Oudart, *L'homme marié*; P. Dominique, *La proie de l'énus*; F. Carco, *Perversité* and especially H. Deberly's *L'ennemi des siens* (family dissensions). R. Gouglet, in *Nouveau Corsaire*, Valléry Radot, in *Terre de vision*, and P. J. Jouve in *Paulinia* are based on spiritualistic beliefs. In a lighter vein, *Les Robinsons basques*, by the master Fr. Jammes; Ch. Vautel, *Mon curé chez les pauvres* (continuation of *Mon curé chez les riches*); M. Dekobra, *La madone des sleepings*, and *La Vénus à roulettes*.

The number of authors depicting rustic life had been increasing steadily and the proportion in 1925 was particularly large; the names of some of the best novelists belong here: Pol Neveux (of the Académie Goncourt) with *Golo, roman de mœurs paysannes*; H. Bordeaux, *Cœur et sang*; G. Chereau, *Le flambeau des Riffaut*, quite realistic but by no means in the pessimistic style of Zola; as to Ch. Silvestre, in *L'amour et la mort de Ch. Pradon*, and in *Aimée Villard, fille de France*, we have something like a conscious attempt to vindicate the peasant as slandered by Zola; Ch.-H. Hirsch, *La passion de Bouteclou* is in the other vein again; and Lucien Fabre, *Tarramagnou*, rather also. Very striking books are Aug. Bailly's *La vestale*, a powerful picture of an Alsatian peasant woman, and Lucien Gachon's *Maria*, peasant life in Franche Comté. A study of the history of the peasant novel in France is given in the Introduction to the American edition (in French) of E. Pérochon's *Nène*, edited by A. Schinz and published by Ginn and Co. A number of the volumes of the "Editions de la vraie France," quoted above, deal with the country life; several are appeals to the peoples of France not to give up agriculture for industrialism.

Exotism is another favorite field for the novelist; and Russia is specially fascinating to him: André Salmon, *Une orgie à St. Petersburg*; J. Vignaud, *Niky, histoire d'émigration russe*; André Beuler, *La ville anonyme*, vision of horror, of a town segregated from civilization by the tornado of revolution and trying to renew contact again; weird is the whole story. Another weird book is *La nuit Kurde*, by J. R. Bloch, pointed out by the critics as a great revelation of the talent of the young author. A charming novel of Japan is Th. Rancat, *L'honorable partie de campagne* (which came very near winning the Prix de la Vie heureuse). Elissa Rhais publishes *L'Andalouse*. Several novels deal with America or Americans, e.g. J. Lombard, *Confession nocturne* (the "malheurs" of a young French nobleman who married a wealthy Ameri-

can girl); Pierre Gourdon, *L'Américaine* (Ed. de la vraie France) tells of an adventure which ends most happily. Chr. Fournier, in *La parabole du mariage* depicts what he has seen of flirting in American co-educational institutions. Canada also was tempting more and more French authors ever since the success of *Maria Chapdelaine*. J. R. de Roquebrune has two volumes, *Les habits rouges*, and *D'un océan à l'autre*, exalting the energy of the French Canadian. He is not the equal of L. Rouquette, author of *Les oiseaux de la tempête*, *Le grand silence blanc*, and *La bête errante*.

Constantin-Weyer had a rather original book under the name of *La Bourrasque*; it is the story of the resistance of the Franco-Indian metis in Canada to the builders of the Canadian Pacific railroad; the hero, Louis Riel, is evidently a historic figure.

War novels continued to appear. Well worth reading are the following: Dumur's *La croix blanche la croix rouge* which is a most interesting picture of war time in Switzerland, the home of the Red Cross, and where there was terrific pressure on the German side to enroll Swiss help; Jacques d'Arnoux, *Paroles d'un revenant* (Préface by Bordeaux). Concerning the after-war period there is first of all Dehoureau's *Enfant de la Victoire*—mentioned above as having been awarded the Grand Prix du roman by the French Academy; then, extremely well received, A. Lamandé's *Ton pays sera le mien* (a French soldier who has married a German girl who adopts her new country); E. Ripert, *Le double sacrifice*—the title is self-explanatory: Jean Renaud, *Les haillons de la gloire*, describing the bitter hardships of a brave officer after the War and his decision to enlist again and seek death in Africa. (We might note here that vol. IV and V,—the two last—of the *Anthologie des écrivains morts à la guerre* by Th. Sandre appeared.) The enthusiasm for sport literature has not proved so great this year; let us cite however Mme Louise Favier, *Les chevaliers de l'air*, and Luc Durtain, *Ma Kimbell*,—this being the name of an auto-cycle.

SHORT STORIES. The best collections are: P. Bourget, *Conflits intérieurs*; Pierre Mille, *Dix-sept histoires*; Marcelle Tinayre, *Drames de famille* (in the Limousin); E. Pérochon, *Huit gouttes d'opium*; Binet-Valmer, *Le taureau* (in his usual violent style). In a lighter style, A. Birabeau, *Le voyage à l'ombre* (in the hero of which some thought they recognized Mr. Caillaux), and Louis Rouquier, *Contes à la Troubilho* (provençal stories, with vocabulary, and quite 'gaulois' in style). The already famous Paul Morand in his *Europe galante*, offers once more what has been aptly called "cosmopolissonneries." The very young Pierre Bost who had scored on the stage last year, scores this year in the short story with *Hercule et Melle*.

VARIOUS ITEMS. This chapter grows larger every year with literary products that can be classified in none of the traditional genres. The book most discussed of the year belongs here, *Jeanne d'Arc*, by Joseph Delteil, an absolutely unconventional treatment, in many instances made grossly vulgar so as to react more forcibly against the traditional conception; the author, however, distinctly loves Jeanne, and he has some fine passages. It was finally awarded, in December, the 'Prix de la Heureuse,' sec-

ond only in importance to the Goncourt prize and awarded by a lady tribunal; we understand that the condition was made however that some of the most unnecessarily objectionable passages be suppressed, and (which is greatly surprising) that the author consented to it.

The Prix Balzac went to *Saint-Paul*, by Baumann, which is a very reverent treatment of the biography of the great apostle by one of the best known in the group of present-day Catholic writers. Joseph Pesquidoux's *Le livre de raison* is an imitation of the diaries written formerly by rich cultivators on their farms; it amounts to a sort of sermon inviting French people to go back to the cultivation of the soil. Jeanne d'Orliac wrote up the mysterious story of the violent death of P. L. Courrier, the pamphleteer (whose centenary was celebrated in France recently)—a death in which his wife may be implicated—under the title *Le crime de la Chavonnière*.

Chevrillon had two charming volumes on Brittany, *L'enchantement breton*, and *La Bretagne d'hier*. The far east continued to attract travelers. R. Dorgelés, the author of *Orois de bois*, wrote a striking volume on China, *Sur la route mandarine*; H. Béraud one on Soviet Russia, *Ce que j'ai vu à Moscou*; the book on Russia however which was most read during the year was the account, by an eye-witness, of the tragedy of the Czar's family: Kessel et Oswolsky, *Les Rois aveugles*. Julien Benda discusses a timely problem, in *Lettres à Méliande*, namely the dangers of the amorality of modern women. E. Péronchon, *Les hommes fénétiques*, gives a novel in the style of Wells' *Anticipations*.

Quite original was the book by Blaise Cendrars, *Or* which tells the story of that Suter, a Swiss adventurer who had by his genial spirit of organization become practically the king of California, when the discovery of gold upset everything, ruined him, and drove him insane; to the last hour of his life he tried to claim his rights in Washington. The humorous MacOrlan has an amusing novel on Rum Row, *Les pirates de l'Avenue du Rhum*. Derennes has another volume of his animal stories, *Ouily et mot*.

Interesting collections were started almost every day in France taking advantage of the formidable hunger for reading in the world. E.g., the love stories of famous historic characters, *La vie amoureuse de Mad. de Pompadour* (by Marcelle Tinaire), *d'Adrienne Lecouvreur* (by Cécile Sorel), *de l'impératrice Joséphine* (by Gérard d'Houville), *de Marceline Desbordes Valmore* (by L. Descaves), etc. Then the collection of the eulogies: *Eloge de la laideur* (Miomandre), *de la frivolité* (Beaunier), *de la bêtise* (Latzarus), *de la folie* (Cassou), etc. M. Henri-Robert issued the fourth volume of his *Les Grands Procès de l'Histoire*. And there is to be a series "Le Roman des grandes existences": *La Vie prodigieuse d'Honoré de Balzac* (René Benjamin), *François Villon* (F. Carco), *Pascal* (Massia), etc.

HISTORY OF LITERATURE AND CRITICISM. Besides works of a purely scholarly nature mention can be made only of a few new editions of medieval masterpieces put in modern French, very specially *L'Histoire merveilleuse de Robert le Diable*, *remise en lumière pour édifier les petits et distraire les autres*, by Thierry Sandre (Amiens), and two volumes of the "Collection médiévale" (Boivin) *Roman de l'Hooufle*, by A. Mary, and

*Berthe au grand pied*, by L. Brandin. Of interest to the general public in the 17th century may be named: *Mad. de Sévigné, sa famille, ses amis*, by Henriette Célaré; L. Brunschwig, *Génie de Pascal*; Baumaal, *Tartuffe et ses aratars*, and two very scholarly but interesting volumes by G. Michaud on *Luttes de Molière and Débuts de Molière à Paris*. In the 18th century: Ledieu's *Diderot et Sophie Volland*; Bellessort's *Voltaire*; Vesinet's *Autour de Voltaire*, and Peter (the Swiss minister in Washington), *Mad. Gallatin, une amie de Voltaire*; Rousseau is abundantly represented in scholarly works: Maritain, *Trois réformateurs, Luther, Descartes, Rousseau*; by Mornet, edition of *Nouvelle Héloïse*; Dufour, *Recherches bibliographiques*, P. P. Plan's continuation of Rousseau's *Correspondence* (Colin).

Albert Schinz published *La Collection Rousseau dans la Bibliothèque de J. Pierpont Morgan*, in *Smith College Studies* (October, 1925). In the 19th century: two books on *Mad. de Staël*, by Comte d'Haussonville, and Comte du Pange; Marie Duclaux, *Victor Hugo* (Coll. "Les grandes existences"); R. Benjamin, *Vie prodigieuse de Balzac* (Coll. "Les grandes existences"); Trahaud, *Jeunesse de Mérimée*; Folkierski, *Entre le classicisme et le romantisme*. Much attention was paid to Lasserre's two volumes on *Jeunesse de Renan, Histoire de la crise religieuse au XIX<sup>me</sup> siècle*. Baron de Seillière has a book on A. Vinet. Henry Bordeaux revives *Barbey d'Aurevilly*, le Walter Scott normand; Estève has a *Sully-Prudhomme*; Charpentier a *Théodore de Banville*; Golstein, a *Verhaeren*; Thibaudet a volume called *Intérieurs* (Baudelaire, Fromentin, Amiel). Droin, a *Valéry et la tradition poétique* (Valéry is to-day much discussed as a poet and has just been elected to the Academy). Books on Anatole France continue to be published; for detailed information see Bédé et Le Bail, "A. France vu par la critique" in *Etudes françaises*, Oct. 15, 1925 (95 Boul. Raspail, Paris); two for 1925 may be cited: de Segur, *Conversations avec A. F.*, and J. Roujon, *Vie et opinions de A. F.*

LITERARY EVENTS. Some of the most important literary prizes awarded during the year were: Grand Prix de Littérature (for the whole literary work)—was first proposed for Camille Maclair, the critic; but on the sudden death of General Mangin this prize went to the latter, and an equal prize called Prix de L'Académie was given to Maclair; Prix de la Langue Française, to Gustave Lanson; Prix Broquette-Gonin (10,000 francs) to Pierre Champion for all his previous work; Prix Théroouane was divided between Baldensperger and Faÿ (see YEAR BOOK for 1924); Prix Claire-Virenque (poetry) to Louis Mercier, for *Petites Géorgiques*; Prix de litt. Coloniale, to L. Charbonneau for *Mambu et son amour*. Outside the Academy, we mention: Prix Goncourt, M. Genevoix, for *Raboliot* (see above); Prix Femina or Vie Heureuse, J. Delteil, *Jeanne d'Arc* (see above); Prix de la Renaissance, G. Girard, *Les vainqueurs* (see last year); Prix sans nom: G. Chéreau, for *Le flambeau des Riffaut*. Prix d'Algérie, L. Lecoq, *Cinq dans ton œil*; etc.

NECROLOGY. J. Rivière, editor *Nouvelle Revue Française*; L. Chadourne, Alf. de Tarde (author of *Espirit de la Nouvelle Sorbonne*); Georges-Victor Hugo (of *L'Art d'être grand-père*; in consequence of this death the famous Hauteville-House, on Guernsey Island, where V. Hugo

wrote his most celebrated works is for sale). Pierre Louys (author of *Aphrodite*); Camille Flammarion (astronomer and novelist); the actor Lucien Guitry; Hugues Leroux; Chuquet, (historian and critic); the poet René Ghil; Elémir Bourges, of the Goncourt Academy; André Beaunier, the critic.

COMMEMORATIONS. Third centenary of *L'Astrée*; centenaries of death of Paul-Louis Courier, and of Saint-Simon; Fiftieth anniversary of Lamartine's death (his works become public property); Monument to Maupassant inaugurated at Miromesnil (where he spent much of his childhood).

The French Academy received Estaunié; elected Duc de la Force (for d'Haussonville); L. Bertrand (for Barrès); Paul Valéry (for A. France). See ACADEMY, FRENCH.

**FRENCH SOMALI** (sô-mă'lî) **COAST** or **FRENCH SOMALILAND**. A French colony in Africa on the Gulf of Aden between the Italian colony of Eritrea and British Somaliland. Estimated area, 5790 square miles; estimated popu-

lation, 1,200,000. The port of Djibouti is the seat of the government. Its population in 1921 was estimated at 8366, of whom 354 were Europeans (190 French). In 1922 a public elementary school system was introduced at the capital, supplanting the mission school which had been in operation for twenty years. The budget for 1924 balanced at 5,015,700 francs. The country has practically no industries and very little agriculture. The main sources of wealth are commerce, inland trade, and coast fisheries. The imports in 1923 amounted to 160,477,793 francs, and the exports to 170,865,647 francs. The chief exports are coffee, ivory, hides and skins. The chief imports are cotton goods, butter, coal, and sugar. A large share of the exports of Abyssinia pass through the port of Djibouti, which is connected by a railway 485 miles long with Addis Abeba. The colony is under a governor aided by an administrative council.

**FRENCH SUDAN**. A French colony comprising the valley of the Upper Senegal, some two-thirds of the course of the river Niger, and a large part of the Sahara Desert within the sphere of Algeria; bounded on the east by the territory of the Niger; on the west by Mauritania, the Falemé River, and French Guinea; on the south by the Upper Volta and the Ivory Coast; and on the north by the territory of Algeria. Area, estimated at 648,480 square miles; population, estimated in 1924 at 2,500,000, of whom 1037 were Europeans. The capital is Bamako with 16,000 inhabitants. Other important towns and their populations are: Kayes, 12,000; Timbuktu, 7000; and Sikasso, 7000. All the chief towns have regional or urban schools. The native crops include ground nuts,

millet, corn, cotton, rice, sesame, rubber, and kariti; also a large number of cattle. Native industries are of some importance, including the making of pottery, jewelry, and leather; and weaving. The total exports in 1923 amounted to 31,050,000 francs and the total imports in the same year, to 4,157,000 francs. The chief exports were ground nuts, cattle, rubber, gum, kopak, skins and wool; the chief imports, cottons, foodstuffs, and metal-work. The budget of the colony provided for 20,195,000 francs. There is a railway connection with the coast over a line 745 miles in length. The government is under the Governor-General of French West Africa (q.v.).

**FRENCH WEST AFRICA**. The collective name of the French possessions in West Africa, comprising the following colonies and territories: Senegal, Guinea, Ivory Coast, Dahomey, French Sudan, Upper Volta, Mauritania, and Niger. The area and population in 1924 by colonies is shown in the accompanying table taken from the *Statesman's Year Book* for 1925:

Colony	Area (in square miles)	Population		African Races	Total
		Non-African Races	French Foreign		
Senegal	74,112	1,966	785	1,268,365	1,266,116
Guinea	89,436	1,083	802	2,024,436	2,026,321
Ivory Coast	121,590	979	74	1,800,779	1,801,832
Dahomey	41,302	761	68	973,773	974,597
French Sudan	356,471	1,028	227	2,560,260	2,561,515
Upper Volta	142,820	317	14	3,015,057	3,015,388
Mauritania	154,200	154	45	284,899	284,598
Niger	404,914	267	2	1,149,295	1,149,564
Total	1,384,845	6,555	2,012	12,571,364	12,579,931

lation in 1921, 208,000. The port of Djibouti is the seat of the government. Its population in 1921 was estimated at 8366, of whom 354 were Europeans (190 French). In 1922 a public elementary school system was introduced at the capital, supplanting the mission school which had been in operation for twenty years. The budget for 1924 balanced at 5,015,700 francs. The country has practically no industries and very little agriculture. The main sources of wealth are commerce, inland trade, and coast fisheries. The imports in 1923 amounted to 160,477,793 francs, and the exports to 170,865,647 francs. The chief exports are coffee, ivory, hides and skins. The chief imports are cotton goods, butter, coal, and sugar. A large share of the exports of Abyssinia pass through the port of Djibouti, which is connected by a railway 485 miles long with Addis Abeba. The colony is under a governor aided by an administrative council.

**FRENCH SUDAN**. A French colony comprising the valley of the Upper Senegal, some two-thirds of the course of the river Niger, and a large part of the Sahara Desert within the sphere of Algeria; bounded on the east by the territory of the Niger; on the west by Mauritania, the Falemé River, and French Guinea; on the south by the Upper Volta and the Ivory Coast; and on the north by the territory of Algeria. Area, estimated at 648,480 square miles; population, estimated in 1924 at 2,500,000, of whom 1037 were Europeans. The capital is Bamako with 16,000 inhabitants. Other important towns and their populations are: Kayes, 12,000; Timbuktu, 7000; and Sikasso, 7000. All the chief towns have regional or urban schools. The native crops include ground nuts,

For primary education there were, in 1922-23, 350 schools with 27,481 pupils; there were also 130 evening schools for adults with 4860 pupils and three higher technical schools with 239 pupils. The imports into French West Africa were mostly food substances, textiles, mechanical implements and beverages; the exports from these colonies were chiefly fruits, oils and oil seeds, as well as rubber, cotton, cocoa, and timber. The accompanying table from the source mentioned above shows the value of exports and imports during 1922 and 1923 for each of the colonies:

Colonies	Imports	
	1922 Francs	1923 Francs
Senegal	223,703,515	813,719,596
French Guinea	30,666,485	57,517,700
Ivory Coast	37,749,898	55,737,848
Dahomey	42,798,789	62,631,469
French Sudan	15,076,675	31,049,847
Upper Volta	1,513,118	12,701,347
Total	351,508,480	533,357,802

Colonies	Exports	
	1922 Francs	1923 Francs
Senegal	192,950,118	254,406,839
French Guinea	21,253,562	34,624,798
Ivory Coast	48,530,218	62,617,632
Dahomey	41,894,132	56,153,137
French Sudan	2,698,307	4,157,436
Upper Volta	4,027,313	8,004,286
Total	311,353,650	419,004,128

There is a general budget for the central government and each of the colonies have their local budgets. The total of all budgets of French West Africa for 1924 (general and local) amounted to 241,665,795 francs.

A governor-general, assisted by a council, is at the head of the administration of all French West Africa. The seat of government is at Dakar. Each colony is under a lieutenant-governor subject to the governor-general. Governor-general at the beginning of 1925, M. Carde, appointed Feb. 20, 1923.

**FRIENDS.** A group of religious bodies of common origin and of cognate faith, comprising in the United States four distinct branches. Founded in the seventeenth century by George Fox, and known as the Religious Society of Friends, and more commonly as Quakers, the denomination was generally excluded from the American colonies until 1724, when William Penn, obtaining a British Crown charter, founded Pennsylvania as a future home for his fellow Friends. The most numerous body of Friends in the United States in 1925, the Society of Friends, frequently called the orthodox body, is organized in 14 yearly meetings or geographical groups each holding its own meeting every year. All but one join in a five years' meeting. Subdivisions of the yearly meeting hold quarterly meetings, or form, directly, monthly meetings of one or more congregations. The Society of Friends conducts nine educational institutions, among others Haverford College, Haverford, Pa. It had in 1923, according to latest figures available, 753 churches, 1312 ministers, 95,128 members, and 614 First Day (Sunday) schools with 65,975 pupils.

The Religious Society of Friends, the next most numerous body, are commonly known as the Hicksites, after Elias Hicks (1748-1830), and separated from the parent body, 1827-28, under the influence of modified beliefs that had gained way with time. A less close insistence on certain points of worship and conduct distinctive of the orthodox branch has caused them to be called the liberal group. The Hicksite body is organized in seven yearly meetings in the United States. It maintains a School for Religious and Social Education at Swarthmore, Pa., and publishes a weekly periodical, the *Friends' Intelligencer*. It reported the number of its members, in 1925, as 16,880. Of this number 10,510 were in the Philadelphia yearly meeting. A general conference, meeting in even-numbered years, carries on interim work of the entire society through standing committees.

The Orthodox Conservative Friends, commonly known as Wilburites, are a group that separated from the parent body in 1845. They hold a yearly meeting at Emporia, Kan. At latest available report they had 50 churches, 50 ministers, and 3373 members. Another distinct group, that of the Primitive Friends, with three churches and some 50 members at last report, is maintained.

**FRUIT.** See **HORTICULTURE.**

**FULLERTON, GEORGE STUART.** American university professor, died March 23. He was born at Fatehgarh, India, Aug. 18, 1859, and graduated in 1879 from the University of Pennsylvania. He studied theology at Yale receiving the degree of B.D. in 1883. Instructor in philosophy at the University of Pennsylvania from 1883-85, in 1887 he became professor, serving also as dean of the department of philosophy, dean of the college, and vice-provost of the university until 1904. He then came to Columbia University where he served until 1917.

From 1913 to 1914 he was American exchange professor to the University of Vienna and other Austrian universities. He was president of the American Psychological Association in 1896. His philosophy was realistic in its general trend. His works include *The Preliminary Report of the Seybert Commission on Spiritualism*, of which he was part author, published in 1887; *The Conception of the Infinite* (1887); *A Plain Argument for God* (1889); *On Sameness and Identity* (1890); *On the Perception of Small Differences in Sensation* (with Professor Cattell) (1892); *The Philosophy of Spinoza* (1894); *On Spinozistic Immortality* (1899); *A System of Metaphysics* (1904); *An Introduction to Philosophy* (1906); *The World We Live In* (1912); *Die Amerikanischen Hochschulen* (1914); *Germany of Today* (1915); and *A Handbook of Ethical Theory* (1922).

**FURNISS, HARRY.** British illustrator and cartoonist, died at Hastings, England, January 14. He was born at Wexford, Ireland, Mar. 26, 1854, his father a civil engineer coming from Yorkshire and his mother being a Scot. After attempting to study at art schools in Dublin he went to London at the age of 19 and by 1880 began to draw for *Punch*, becoming a member of the staff of that periodical in 1884. He soon enjoyed an extraordinary vogue which led him to produce a prodigious amount of work. People enjoyed his humorous presentations of the statesmen of the day and the fanciful and imaginative drawings usually in humorous vein which he made to illustrate novels, fairy tales, and parodies. He had individuality of method and beauty of line, though the quality of his work as well as his taste varied. He left *Punch* in 1894, starting a weekly paper called *Lika Joko*, but the venture was a failure. In 1910 he illustrated the works of Dickens and in 1911 made illustrations for the centenary edition of Thackeray. As a lecturer, he toured the British Empire and America, and he also drew for commercial purposes, some of the most famous British advertisements being his work. His cartoons during the War were abundant, but not forceful and effective. He was the author of many film plays produced in England and in America.

**FUR-SEALS.** See **ALASKA.**

**GABUN.** See **FRENCH EQUATORIAL AFRICA.**

**GALICIA.** A former crownland of the Austro-Hungarian Empire, but after 1919 an integral part of Poland. The district lies to the south of Poland and to the west of Podolia in Russia.

**GALL STONE DISEASE.** Since the article on this subject appeared in the 1924 volume of the **YEAR BOOK** remarkable improvements have been made in X-ray diagnosis. Up to that time it had been possible to recognize stone in the gall bladder in a large per cent of cases (perhaps 50) and to recognize adhesions of the organ when the hollow viscera were filled with a contrast fluid. But when the finds were negative, as so often happened, the diagnostician was helpless, for he could not pronounce the patient free from disease. Late in 1924 a group of physicians in St. Louis, Drs. Graham, Cole, Moore and Copher, made the discovery that the gall bladder could be rendered visible to Roentgen rays by intravenous injection of halogenated phenolphthalein. As there is a considerable group of these bodies a number of them were tried out for comparison. It was next sought to

determine whether some of them were not adapted for oral administration, for now and then the intravenous route was known to produce untoward symptoms. The idea was tested in other cities and the claim of the St. Louis physicians was sustained. In the great majority of patients tested positive results were obtained—gall bladder shadows which permitted the diagnosis of a normal or diseased organ. During the intervening year the technic was varied in all possible ways in the effort to secure an optimum.

In the *Journal of the American Medical Association* for September 26, the authors already mentioned summed up their work. They had examined 112 patients by the new technic, making use of the salt known as sodium tetraiodophenolphthalein given by the mouth in capsule or pill form, coated with phenyl salicylate. Although this form of administration had made good it was admitted that the intravenous route gives the better results and should be employed whenever the oral method gives ambiguous results. The authors had made 467 single examinations and in 95 per cent the original diagnosis was confirmed by operation. The total number of examinations by the entire profession by the end of 1925 amounted to several thousand and with no report of a death.

The rationale of the method is as follows: the salts when thrown into the circulation are arrested within the liver, which tries to expel them through the secreted bile. In this way they reach the gall bladder where they become concentrated and absorb more of the Roentgen rays than the soft tissues; so that the gall bladder gives a distinct shadow. The stones when present are not rendered visible. The mechanism is the same when the drug is given by the mouth but the shadow is less intense.

**GAMA, gâ'mâ, DOMICIO DA.** A Brazilian diplomat, died November 8. He was born at Ponta Negra, Rio de Janeiro in 1862, and first attracted attention in newspaper work, serving as Paris correspondent of the *Gazeta de Notícias*, 1887-88. He became a regular contributor to Brazilian and foreign magazines. In 1893 he was secretary of the special commission on the Argentine-Brazil boundary dispute, which was arbitrated by President Cleveland. His experience in diplomatic work led to his being dispatched on special missions to Berlin and Paris. In 1901 he was appointed chargé d'affaires at Brussels. He served as minister to Peru, 1907; to Argentina, 1908; and, 1911-18, to the United States. In 1914 he was a member of the A. B. C. (Argentina, Brazil, Chile) conference for mediation between the United States and Mexico. He returned to Brazil to become minister of foreign affairs, and in 1919 he was appointed ambassador to Great Britain, serving until 1924. He was the recipient of a medal from Congress in 1918 for his services in connection with the Niagara Falls conferences to avert difficulties between the United States and Mexico. On Nov. 27, 1912, he married in New York the widow of George A. Hearn. Highly esteemed in Washington he did much to promote cordial relations between his country and the United States.

**GAMBIA.** A British protectorate and colony in West Africa at the mouth of the Gambia River. Area of Gambia proper, 4 square miles; population, about 9000. Area of protectorate,

4130 square miles; population in 1921, about 200,000. The capital is Bathurst, on the island of St. Mary (population, 1921, 9227). In 1923 there were eight elementary government-aided schools with 1762 pupils enrolled. In 1923 the total imports were £813,898 and the total exports, £899,509. Peanuts were the chief export. The imports from the United Kingdom amounted to £444,329 and the exports to the United Kingdom were £440,368. The public revenue in 1923 was £229,688 and the public expenditure £211,317. The public debt amounted to £147,893. The total tonnage of vessels entered and cleared in 1923 was 1,052,982 of which 591,938 were British, a large increase over the preceding year. The colony is administered by a governor, an executive council and a nominated legislative council containing an unofficial element. Governor at the beginning of the year, Captain Cecil H. Armitage.

#### GARBAGE AND REFUSE DISPOSAL.

A trend towards incineration of garbage mixed with the more combustible refuse or rubbish of cities was evident in a number of the larger cities of the country in 1925, but with delays in execution of tentative programmes for entire cities due in considerable part to opposition to sites chosen for the incinerators. Altogether, in cities large and small, a number of incinerators were completed or put under construction. Disposal by reduction, by feeding to hogs, in "sanitary fills" (by dumping to fill low land, the top of the dump being covered with clean earth or ashes) and, in a few cases, burial in shallow earth trenches was also continued. Steam generated at the incinerator of Atlanta, Georgia, and blown off or wasted for years, except as used for works purposes was sold, beginning early in the year, to a local utility company for use in making gas for illuminating and heating purposes. Kansas City, Missouri, contracted for garbage collection and disposal and the city approved the contractor's plan to treat the garbage by a modified reduction process, under which it was proposed to produce an animal food, something not heretofore done except in a comparatively small and experimental way, although the city of Indianapolis expected to do a similar thing by another process at its new municipally owned reduction plant. The world's largest example of garbage disposal by hog feeding was in California, where a contractor paid the city of Los Angeles, California, 60 cents a ton for garbage delivered at a railway siding, transported it fifty miles to a fruit and hog ranch in the country and fed it to hogs at a carefully designed and managed feeding plant where as high as 40,000 hogs are sometimes kept. (See *Engineering News-Record*, Aug. 6, 1925.) A summary of information as to the garbage disposal practice in 86 American cities of 40,000 to 70,000 population, gathered by the American Child Health Association, New York City, and published by it in a book entitled *Health Survey of 86 Cities*, showed disposal by feeding to hogs in 29 cities, by incineration in 25, by dumping in nine and by reduction in three.

**GARCIA, GUSTAVE.** An English dramatic baritone and famous singing teacher, died at London, June 12. A son of the great Manuel Garcia, he was born in Milan, Feb. 1, 1837. After studying with one of his father's pupils, Bucine, in Paris, he completed his studies under

his father, in London, and made his début in Milan, in Donizetti's *Don Sebastiano* (1862). He sang in Italy and England until 1880, when he retired from the stage, and settled in London as a teacher. He was professor at the Royal Academy of Music, the Royal College of Music and the Guildhall School of Music, which latter position he resigned in 1911 to devote himself exclusively to his private pupils. He is the author of *The Actor's Art*.

**GARDENER, MRS. HELEN HAMILTON.** American author and United States Civil Service Commissioner, died July 26. She was born at Winchester, Va., the daughter of the Rev. Alfred Griffith Chenoweth and after graduating at the High School in Cincinnati, O., studied at the Ohio State Normal School and later took up postgraduate work in biology, medicine and other branches in New York City. In 1873 she became principal of the Ohio Branch State Normal School and later was lecturer on sociology in the Brooklyn Institute of Arts and Sciences. She was deeply interested in development of women and in ethical reform, serving as vice-president and as vice-chairman of the Congressional Committee of the National American Woman Suffrage Association. Apr. 13, 1920, she was appointed a member of the United States Civil Service Commission, being the first woman to hold the office. She spent many years in travel studying social and political conditions and was considered an authority on heredity. In addition to many stories, essays, and scientific articles she was the author of: *Men, Women and Gods* (essays) (1889); *Is This Your Son, My Lord?* (1890); *A Thoughtless Yes* (1891); *Pray You, Sir, Whose Daughter?* (1892); *Pushed by Unseen Hands* (1892); *Facts and Fictions of Life* (1893); and *An Unofficial Patriot* (1894). She was a member of many woman's clubs and organizations devoted to social science and social service.

**GARDENING.** See HORTICULTURE.

**GARSTIN, SIR WILLIAM, G.B.E.** British Civil Engineer and designer of irrigation and other

public works in India and Egypt, died in London on January 8. Born in India Jan. 29, 1849, was educated at Cheltenham College and King's College, London, and joined the Indian Public Works Department at the age of 23. He remained in this service until 1892, but in 1885 he went to Egypt where he was engaged on Nile irrigation for a number of years. Under his direction the Assiut weir, the Assuan dam, and several barrages were built so that perennial irrigation was made possible in Egypt. In 1892 he became inspector general of irrigation in Egypt and later under-secretary of state for Egypt after which he was adviser to the Egyptian Ministry of Public Works. In 1904 he became the representative of the British Government in the directorate of the Suez Canal and in 1905 received from the Egyptian Government a grant of £15,000 in appreciation of his services. He was active in Red Cross work during the World War and in 1918 was created G.B.E.

**GAS, ILLUMINATING AND FUEL.** The manufactured gas industry in the United States in 1925 enjoyed a prosperous year, having sold 421,000,000,000 cubic feet as compared with 405,000,000,000 cubic feet in 1924, the former figure setting a new high year record. Furthermore the 1925 figures were an increase of 100,000,000,000 cubic feet over the previous five-year statistics, and in 10 years the sales of gas had more than doubled. In 1925 the 984 gas companies in the United States connected 403,000 new customers to their lines, making a total of 10,600,000 customers as of Dec. 31, 1925. The American gas companies were serving a total population of 52,000,000. In the last 10 years, while both domestic and industrial uses of gas showed steady increases, the use of gas in industry alone had shown a gain of 1000 per cent and the trend was still distinctly upward. There particularly was an increased tendency to use gas in heating homes, which in the latter part of 1925 was largely accelerated by the anthracite coal strike. It was estimated that

NATURAL GAS PRODUCED IN THE UNITED STATES AND DELIVERED TO CONSUMERS,  
1922-1923, BY STATES \*

[Value is at point of consumption.]

State	1922	Value	1923	Value
Arkansas	9,700,000	\$1,798,000	24,215,000	\$3,255,000
California	84,580,000	17,898,000	131,434,000	22,787,000
Colorado	4,000	560	800	400
Illinois	3,383,000	424,040	4,049,000	690,000

West Virginia	195,288,000	69,464,000	203,867,000	69,981,000
Wyoming	23,427,000	3,081,000	35,523,000	4,222,000
Other <sup>c</sup>			97,400	8,680
Total	762,546,000	221,535,000	1,008,135,000	289,966,000

\* Corresponding figures for 1924 not yet available.

<sup>b</sup> Included under "Other."

<sup>c</sup> Alaska, Iowa, New Mexico, and North Dakota.

the increase in gas-fired house systems had averaged more than 2000 per cent since 1919 and new installations were being made at the rate of 100,000 a year. The American Gas Association, which annually summarizes statistics of the industry, reported that of more than 9,000,000 meters actively in service during 1925, only 3232 belong to companies in the hands of receivers. The association prepared detailed statistics of the manufactured gas industry for 1924, reporting 984 companies, of which 57 were municipal plants supplying manufactured gas to the public. In addition 92 coke oven plants were selling gas to distributing companies. In 1924 the estimated production of manufactured gas was as follows: Carburetted water gas, 237,097,000,000 cubic feet; coal gas, 60,202,000,000 cubic feet; oil gas, 27,466,000,000 cubic feet; coke oven gas purchased and distributed for public use, 63,350,000,000. (Coke oven gas consumed at point of production or for purposes other than public use is not included.) Total manufactured gas, 388,115,000,000 cubic feet. Natural gas purchased and mixed with manufactured gas for public use 53,266,000,000 cubic feet; the value of the gas sold was placed at \$438,000,000. Of the manufactured gas it was estimated that 71.8 per cent was for domestic use, 26.1 per cent for industrial use, and unclassified 2.1 per cent. Grand total 441,381,000,000 cubic feet. Distribution data for 1924 were as follows. Number of meters-prepayment 837,810, ordinary 9,562,190, total 10,400,000; number of consumers 10,200,000; miles of gas main 80,975; meters per mile of main 128; number of active services 7,000,000; population served 52,000,000. For purification of illuminating gas see CHEMISTRY, INDUSTRIAL.

**GAS, NATURAL.** The U. S. Bureau of Mines estimated the natural gas consumed in the United States in 1924 at 1,095,000,000 M cubic feet, valued at \$254,000,000 as compared with 1,088,135,000 M cubic feet, valued at \$239,966,000 in 1923. These two years showed a considerable increase over 1919 and succeeding years. The natural gas produced in the United States and delivered to customers by States in 1922 and 1923 is given in the table on page 269 furnished by the U. S. Bureau of Mines in its annual summary of Mineral Resources. In 1924 it was estimated that 894,000,000 gallons of natural gasoline, valued at \$77,500,000 was produced in the United States as compared with 816,226,000 gallons, valued at \$77,268,000 in 1923.

**GAS AND OIL ENGINES.** See INTERNAL COMBUSTION ENGINES.

**GASOLINE, DANGEROUS.** See CHEMISTRY, INDUSTRIAL.

**GASOLINE.** See PETROLEUM.

**GEEB, WILLIAM HENRY.** Physical director at Harvard, died April 1. He was born at Alexandria, Minn., Jan. 30, 1885, and was educated at Carlton College, Northfield, Minn., graduating in 1908. He studied at the International Young Men's Christian Association College, Springfield, Mass., in 1913 and later at New York University. After serving as assistant in chemistry at Carlton College, 1906-08, he became science instructor and athletic director in the High School at Austin, Minn., 1908-09, and was secretary and recreational director at the Government Club house, Canal Zone, Panama, 1910-12. Subsequently he was instructor in

mathematics at the International Young Men's Christian Association College and director of physical education and playground supervisor at Mt. Vernon, N. Y., 1913-17. In 1917 he became assistant inspector of physical training for the Military Training Commission of the State of New York during the period of the War. In 1919 he was made supervisor of physical education of the State of New York, and became director of physical education at Harvard in 1919, where he directed the summer school physical education and was a lecturer at the Harvard Graduate School.

**GEIL, WILLIAM EDGAR.** American explorer and author, died April 13. He was born near Doylestown, Pa., and educated in the public schools and seminary of that city and at Lafayette College. In 1896 he made archaeological studies in Western Asia, and in 1901 started on a comparative study of the primitive races and an independent observation of the missions of the world. China and Africa were crossed in his travels and he went further into the pigmy forest than did Stanley. His trip consumed four years. He explored the Great Wall of China and visited the 19 capitals of that country. He lectured in many lands, and was elected a life fellow of the Royal Geographical Society, a member of the Royal Astronomical Society, and of the Royal Asiatic Society. In 1919 he explored the Wu Yo or five Sacred Mountains of China. He recorded his travels in many books and articles, the best known being *Pocket Sword* (1895); *Laodicea* (1898); *The Isle Called Patmos* (1898, 1905); *A Yankee on the Yangtze* (1904); *The Man of Galilee* (1904, 1906); *A Yankee in Pigmyland* (1905); *The Men on the Mount* (1905); *The Automatic Galf* (1905); *The Great Wall of China* (1909, 1911); *Eighteen Capitals of China* (1911); and *Adventures in the African Jungle Hunting Pigmies* (1917).

**GENERAL EDUCATION BOARD.** See UNIVERSITIES AND COLLEGES.

**GENETICS.** See BOTANY.

**GEOGRAPHICAL SOCIETY, AMERICAN.** The oldest geographical society in the United States, founded in 1852, "to collect and disseminate geographical information by discussion, lectures, and publications: to establish in the chief city of the United States a place where may be obtained accurate information on every part of the globe; and to encourage such exploring expeditions as seem likely to result in valuable discoveries in geography and related sciences." The Society's leading activity in 1925 was in the field of publication. Its publications consist of books, pamphlets, maps, and a quarterly periodical, the *Geographical Review*. The *Review* contains a great variety of articles on all branches of modern geography, a record section based upon the analysis of the world's current geographical literature, and reviews of the more significant geographical books. The books and pamphlets published by the Society fall into five series, within which each item is numbered. The *Research Series* consists of specialized monographs; the numbers published in 1925 dealt with the geographical lore of the time of the Crusades and with Bering's voyages. The *Special Publications* form a series of works of a more general appeal. The *Library Series* is devoted primarily to the collections of the Society. Two issues of the

*Outing Series* had appeared up to the end of 1925: A trampers' guide to the Palisades Interstate Park and a trampers' guide to the vicinity of New York City.

The publications of the fifth series, one of which was in print at the end of 1925 are known as the *Map of Hispanic America Publications* and are to accompany an important group of maps which the Society was engaged in producing. These basic maps of Hispanic America are on a scale of 1:1,000,000 and are in essential conformity with the International Millionth Map of the World. Notable progress in this work was accomplished in 1925; a number of sheets were ready for distribution and others were in an advanced stage of preparation. The maintenance of a specialized geographical library and of an extensive collection of maps is an important phase of the Society's activity. Valuable additions were made to these collections in 1925. Six regular lectures by distinguished explorers or geographers are delivered each year before the members and guests.

The Society recognizes contributions to the development of geographical science and exploration in its elections to honorary and corresponding memberships and in the bestowal of medals. During 1925 the Charles H. Daly gold medal was presented to Knud Rasmussen for his studies of the Eskimo. Two corresponding memberships were filled in the course of the year. The President of the Society in 1925 was John H. Finley, LL.D.; Isaiah Bowman, Ph.D., was director and editor; the Society's building is at Broadway at 156th Street, New York City.

**GEOGRAPHIC SOCIETY, NATIONAL.** This organization, founded in 1888 "for the increase and diffusion of geographic knowledge," by 1925 had attained a membership of some 950,000, representing every civilized nation, and it continued to support a broad programme of exploration and research, and educational activity. During 1925 the Society had four expeditions in the field, from which valuable scientific information was obtained. That headed by Donald B. MacMillan and conducted in cooperation with the United States Navy, in the ships *Bowdoin* and *Peary*, spent 16 weeks in north Greenland and Ellesmere Island, where the first airplane flights, the first color photographic survey, and a most extensive study of plant and animal life were made in that Arctic region. Valuable information about the topography of Ellesmere Island, and the possibility of future Arctic flying was obtained in the course of flights made by Lieutenant Commander Richard E. Byrd, Jr., with eight Navy men and three Loening amphibian airplanes loaned by the U. S. Navy, circling over more than 6000 square miles, observing some 30,000 square miles of hitherto unexplored territory west of Smith Sound. Dr. Walter N. Koelz, chief naturalist of the expedition, reported specimens of more than 1500 birds collected, observed the breeding places and saw juveniles of many species of the bird family known to civilization only in the adult stages, and secured other valuable data on bird, fish, flower, and animal life in that Arctic region. Important facts about magnetic and tidal phenomena were ascertained through the observations of Lieut. Benjamin F. Rigg, while interesting data on temperature and wind velocity for use in aviation

and weather forecasting were collected by the aërographer, Albert Francis. One of the most remarkable accomplishments of the expedition was the color photographic work done by Jacob Gayer, by which he secured the first artistic portrayals of the actual tints and hues of Arctic scenes, forming a permanent record of scientific value toward the study of ice formations and life forms. Maynard Owen Williams supplemented this work with an extensive black and white photographic survey. A new phase in Arctic expedition work was the sending of daily radio messages on short wave lengths of 16 to 40 meters while working in 24-hour daylight.

Another expedition organized by the Society was that to Pueblo Bonito under the direction of Dr. Neil M. Judd, which brought back interesting revelations about the pre-Columbian communal dwelling in Chaco Canyon, the metropolis of early North America; and details obtained about the daily life of the Bonitans demonstrated that the culture of these early American aborigines had no connection with the Egyptian or other old world civilizations.

At Cuicuilco, Mexico, the oldest known human habitation ruins in the Western hemisphere, investigations were made under the leadership of Dr. Byron Cummings to determine the age of the ruins. After geological studies of a huge mound built by some pre-Aztec, pre-Toltec monarch, reigning even before the days of Abraham, Dr. N. H. Darton concluded that the habitation dated back more than 4000 years.

An expedition to study solar radiation and last over a period of four years under the joint auspices of the National Geographic Society and the Smithsonian Institution was inaugurated November, 1925, when Dr. Charles G. Abbot departed from the United States to survey prospective sites in Baluchistan and the former German East-Africa for a station. The purpose of the observations is to determine the feasibility of long range weather forecasting on a basis of solar radiation variation, and if it is found possible to prophesy weather conditions weeks and months ahead, the investigations of the expedition will prove of considerable scientific value to agriculture and navigation.

In 1925 the Society concluded its extensive series of regional maps of the world delineating continents and oceanic areas, including a map showing the latest available data on the Arctic. A series of State maps of the American commonwealths was begun by the Society in 1925, which means a tremendous cartographic undertaking requiring some years for completion. There were furnished during 1925 bulletins dealing with the geographical backgrounds of current events to more than 550 of the country's leading newspapers, and weekly printed, illustrated bulletins of timely geographical information were sent to about 22,000 school teachers. As a part of its educational work a weekly ready-to-print service was supplied to about 1200 small daily or weekly papers. Upon request bulletins relating to the geography of Bible lands and mission fields were sent to many church and Sunday school periodicals, and these bulletins, reprinted in 17 languages, were widely used in schools where Americanization work was in progress.

The chief activity of the Society in the diffusion of geographic knowledge was carried on

through its official publication, the *National Geographic Magazine*. Officers in 1925 were: President and Editor-in-chief, Gilbert Grosvenor; Vice-President, Henry White; Vice-President and Associate Editor, John Oliver LaGorce; Treasurer, John Joy Edson; Secretary, O. P. Austin; Associate Secretary, George W. Hutchison; Assistant Editors, William Joseph Showalter, and Ralph A. Graves; Chief of Illustrations, Franklin L. Fisher; Chief of School Service, J. R. Hildebrand. The Board of Trustees included: William Howard Taft; John Joy Edson; David Fairchild; C. Hart Merriam; O. P. Austin; George R. Putnam; George Shiras, 3d; Grant Squires; Charles J. Bell; C. M. Chester; Frederick V. Coville; Stephen T. Mather; E. Lester Jones; Charles G. Dawes; John Foote; Gilbert Grosvenor; Rudolph Kauffmann; J. Howard Gore; A. W. Greely; John Oliver LaGorce; George Otis Smith; O. H. Tittmann; Henry White; John Barton Payne.

**GEOGRAPHY.** See **EXPLORATION.**

**GEOLOGY.** Among the year's contributions in geology may be noted a fair number that dealt with fundamental problems and that especially call for attention in a brief review of this character. Isostasy may be mentioned as one of these problems, to which American geologists, especially, have given much study from the time the theory was analyzed and formulated by Dutton. It should be remarked, also, that they have had able assistance from members of the U. S. Coast and Geodetic Survey, notably Hayford and Bowie, who have assembled and examined a great mass of data supplied by the many stations for gravity observations. These have added greatly to the validity of the theory, but the final tests must come from the field of geology in the application of isostasy to the regional movements of the crust, a relationship that is not altogether clear.

F. A. Melton criticized the tendency to regard anomalies of gravitation as superficial effects connected with irregularities in density of rock masses near the earth's surface. For example, the Appalachian trough, comprising an area 1300 km. long by 100 km. wide, shows a deficiency of density or negative anomaly too strong to be accounted for by the light mass of underlying sediments. It is not clear why a region of so light density should possess so low relief on the theory of complete isostatic adjustment; rather it would appear that the trough is held in place by the strength of the crust. Other regions with consistent anomalies are western Wisconsin and eastern Minnesota, with deficient gravity, the Black Hills, with excess gravity, and southwestern California, with deficient gravity. Such areas may furnish a measure of crustal strength, independent of isostatic compensation.

**COMPOSITION OF THE EARTH.** Although the interior of the earth is beyond the reach of observation, there is substantial basis for the study of the structure and composition of its materials by means of indirect evidences supplied by gravity measurements, passage of earthquakes, compressibility of minerals, chemistry of rocks and the nature of extra-terrestrial bodies like meteorites. One of the foremost students in this department, H. S. Washington, recently brought together the results of his extended researches and arranged them into a definite plan which provides, in some particulars at least, a new theory of earth structure. The earth is

regarded as a series of concentric shells, surrounding a nucleus or core. From centre to circumference the material decreases in density, as each layer represents a more or less definite range of mineral composition between the heavy and the light elements. The innermost nucleus can be likened in character to the siderites or iron meteorites, that is, it consists of nickel-iron as the essential constituent. It has a density of about 10 times that of water. Its radius is estimated at 3400 km. Through admixture with iron and magnesium silicates, increasing in proportions toward the border, the nucleus passes into a lithosporic shell of the nature of meteoritic pallasite. This may be described as a mixture of metallic nickel-iron and non-metallic olivine, so proportioned that the average density is about 8.

The lithosporic shell has a thickness of about 700 km. With increase of the silicate element this layer grades into the ferrosporic shell, which resembles the chondritic stony meteorites, composed largely of olivine and enstatite-hypersthene. The density of this layer is 6 and its thickness 700 km. Silicates, chiefly olivine, enstatite, and hypersthene, compose the next layer, which is essentially like the rock peridotite or an achondritic meteorite. Its density is 4 and it is 1500-1600 km. thick. The last layer, the crust, is only 60 km. thick and consists of a lower basaltic part, 3.2 in density, and an upper granitic part, perhaps 15-20 km. thick and a density of 2.8.

The relative masses of the several shells are as follows, expressed in terms in percentage of the whole: Central core, 27.30; lithosporic shell, 8.51; ferrosporic shell, 22.55; periodotitic shell, 40.08; basaltic shell, 1.08; granitic shell, 0.48. In the composition of the earth as a whole Washington assigns to iron a smaller rôle than that given by other authorities, e.g. Clarke, as he estimates the portion in metallic form at 31.82 per cent and the portion combined in the form of silicate at 7.94 per cent. On the other hand oxygen constitutes 27.71 per cent and silicon 14.53 per cent, somewhat more than the usually allotted amounts. To magnesium he assigns 8.69 per cent; nickel 3.16 per cent; calcium 2.52 per cent; aluminium 1.79 per cent; sulphur 0.64 per cent; sodium 0.39 per cent; cobalt 0.23 per cent; chromium 0.20 per cent; potassium 0.14 per cent; phosphorus 0.11 per cent; manganese 0.07 per cent; carbon 0.04 per cent; titanium 0.02 per cent.

**ORIGIN OF THE CONTINENTS.** The weight of opinion among geologists probably favors the view that the continents and oceans have occupied their present positions, however much their outlines may have been modified by regional uplifts and depressions, from the earliest times. Some facts, to be sure, remain to be reconciled with this principle, like the similarities of faunas and of the stratigraphic sequence between lands now separated by wide oceanic depressions. Thus the Gondwana formations of India have their counterparts in South Africa and South America, and close comparisons may be drawn between the Pre-Cambrian rocks of northern Europe, Greenland, and eastern Canada. Other evidences of like import may be cited to indicate that possibly great changes in the configuration of continental lands may have taken place. Yet, altogether the trend of opinion is toward the conception of stability of the con-

tinents and oceans, exceptions being granted where it can be shown that land connections are indicated by submarine plateaus or partially submerged blocks. As a highly speculative treatment of the subject may be mentioned the work of Wegner, recently translated into English, which advocates the hypothesis that the continents are subject to a slow horizontal displacement under the tidal action of the sun and moon. They are supposed to be buoyed up on a heavy viscous layer. In this manner South America has drifted away from Africa to which it was once united, the movement being estimated at 0.2 m. a year. The scheme merits some notice on account of its ingenuity, but it lacks as yet any solid foundation of scientific data.

**VOLCANISM.** The study of the gaseous element in igneous activity has great possibilities for the interpretation of causal conditions, but it has lagged far behind that of the solid materials, because of the difficulties in obtaining samples free from contamination. E. S. Shepherd described the results of experiment in handling and analyzing gases that have been obtained in the Carnegie Geo-Physical Laboratory. The emanations from the earth's interior include gases from volcanic eruptions, from fumaroles, from mines, wells, and springs, and the gases occluded in rocks and minerals. Samples taken from a volcano in active eruption do not necessarily represent the direct contribution from the interior source, but may be and probably are contaminated in their passage through the volcanic conduit by admixture with air and other surface-derived gases.

In 1919 a series of samples was collected from Kilauea in a manner to avoid contamination as much as possible, but they still contained air. The presence of limestone in the ejecta of Vesuvius indicates another method by which impurities may enter the magmatic emanation. Gases obtained by heating fresh lavas in a vacuum may be presumed to be the residues of those originally dissolved in the lava when it reached the surface. In plutonic or deep-seated rocks such an assumption is less warranted. Gases in fumaroles alongside an active volcano should exhibit a degree of similarity to those collected from the lava itself, but they may be affected by irregular condensation as well as by presence of air. Away from volcanic vents gases become more admixed with foreign substances, especially the reaction products from seepage of underground waters, the atmosphere, and the distillation products of buried rock masses. It may be assumed that there is a slow diffusion outward of gases from the depths of the earth, for which an appropriate name would be the subterranean atmosphere; gases from mines, wells and springs exemplify that type.

**LACCOLITHS.** A requisite condition for the production of domed bodies of intrusive rock, according to MacCarthy, is viscosity of the magma. A thin or fluid material is likely to spread out into sheets or sills. The time element, also, has a bearing upon the shape assumed by the intrusion, for if the magma is forced up rapidly it will cool as an irregular body or stock. On the other hand extreme viscosity favors the formation of byssaliths. Environment as related to the structure of the intruded strata exercises some influence, doubtless, upon the shape taken by the magma. Thinly bedded materials are

conducive to the formation of lenticular or sill-like laccoliths; thick strata are favorable to the development of strongly convex types—the two kinds being exemplified, respectively, by the laccoliths of the Judith Mountains and the Henry Mountains. The character of the dome has little bearing, apparently, upon the shape of the interior core, although the thickest part of the mass is likely to be near the centre.

**AGE OF THE EARTH.** Investigations in regard to geological time have greatly widened the limits set by earlier researches, like those made by Lord Kelvin 25 or more years ago. Radioactivity is the key to the new methods of calculation. This form of energy, of course, escaped the attention of Kelvin in his discussions, but it was later shown by Strutt and Joly that its contribution toward maintaining the inner heat of the earth was sufficient to prolong the process of cooling over a period many times as long as had been allowed. On the basis of the additional factor Arthur Holmes raised the possible limit of the earth's age to around 1000 million years. That this estimate may not be far from the mark is indicated by another method of calculation based upon the fact that the end product of radioactive processes is the metal lead and its proportions in uranium and thorium minerals supply a direct means of reckoning the time that has elapsed since the minerals were deposited.

A systematic study of such minerals has been instituted by Lane in the United States and Ellsworth in Canada. Some results have already been announced by Ellsworth on samples taken from the Pre-Cambrian formations of Canada and Norway. The figures obtained range from 973 millions to 1316 millions of years for the lapse of time since the Pre-Cambrian deposits were laid down. The interval between the oldest and youngest of the deposits is a measure of the duration of the included section of the Pre-Cambrian, but does not include the whole section, since there were no samples of Grenville age employed. It would seem probable that an additional 50-100 millions of years should be added to cover that formation.

**EARLY LIFE.** The earliest so-called fossiliferous rocks have abundant and varied life forms that indicate a long ancestry about which practically nothing is known. The paucity of fossil remains before Cambrian time is largely the result of the profound physical and chemical rearrangements which the older formations have undergone. In a microscopic examination of materials from the Mesabi formation (Upper Huronian) of Minnesota, Gruner found markings that he identified as algae and bacteria of contemporaneous age with the enclosing media, possibly the most ancient forms that have been discovered so far. It is not improbable that higher types of plants and animals were in existence at that time.

**METAMORPHISM.** For his presidential address before the Ithaca meeting of the Geological Society of America, W. Lindgren selected the topic of metasomatism, which he defined as the change of one mineral to another of differing chemical composition through an essentially simultaneous process of solution and deposition in the presence of a fluid phase. Replacement is a synonym for metasomatism, but the latter, being adaptable to foreign languages as well as to English, is preferable: The main thesis of the address

concerned the development of colloidal substances which may be termed gel-metasomatism, a process that has not been given proper importance in his estimation. Its recognition is difficult because the gel sooner or later becomes crystalline and the original concentric or concretionary structure may be lost. As examples of its agency in ore-formation may be cited such minerals as chrysocolla, copper-pitch ores, some malachite, jarosite and zinc carbonate, occurring in the oxidized zone, and some of the chalcocite and marcasite in the sulphide zone. In deposits formed at relatively high temperatures definite evidence of gel-metasomatism is generally lacking. The change involved in the process rarely means any gain or loss of volume, according to Lindgren, although if this be true the chemical reactions in many instances can not be represented by the usual balanced equations.

**STRATIGRAPHY.** In the field of stratigraphic correlation a contribution of exceptional breadth and value appeared in the *Bulletin* of the Geological Society of America, Dec. 30, 1924, on the classification and correlation of the Tertiary deposits of North America, Central America, West Indies and Europe. The introductory paper by Vaughan gave a critical summary of the standards of correlation and a brief account of the recognized subdivisions of the Tertiary formations in the different fields. Other contributions by specialists in the particular branches dealt with the biologic and stratigraphic features applicable to correlation of the formations.

In his address before the Paleontological Society of America, Ithaca Meeting, Berry reviewed the various criteria used in correlation and showed the need for discrimination in their application to any stratified series. Of first importance as a basis of comparison are the evidences derived from paleontology: less reliance may be placed on the principle of diastrophism, however attractive it may appear in theory, for the reason that the shifting of shorelines can rarely be shown to be synchronous even within the limits of a single continent.

**MINERAL DEPOSITS.** The search for more exact methods in field investigations as an aid to locating and developing mineral deposits has been an important feature of recent activities in economic geology, for which the growth of industrial requirements has supplied sufficient incentive. The inquiry has followed in the main established physical and chemical principles. The use of magnetic observations for determining the presence of iron and nickel minerals in concealed bodies has long been practiced with success; but now gravimetric, electric and seismic determinations may be applied to a much larger array of minerals or to the discovery of conditions favorable to their occurrence. Gravity tests by means of a pendulum, for example, have revealed buried salt domes where there were no surface indications of their presence, and electric currents have given useful data in locating various metallic substances and coal beds. Reference to chemical criteria will be found in the *YEAR BOOK* for 1924. It would appear that these methods, though still in an experimental stage, have great possibilities as an adjunct to field explorations and will become, very likely, an indispensable part of the equipment of the practical geologist.

Theories of the origin of ore deposits contin-

ued under debate, but discussion centred more about the explanation of individual deposits than upon general principles, which have undergone no substantial changes in the period under review.

**GEOPHYSICS.** See **CHEMISTRY** under *Mineralogical Chemistry*.

**GEORGETOWN UNIVERSITY.** A Roman Catholic institution of the higher learning at Washington, D. C.; founded in 1780. The enrollment for the fall term of 1925 totaled 2174, distributed as follows: arts and sciences, 696; medical, 276; dental, 128; law, 607; foreign service, 467. The faculty in all departments numbered about 250. The Riggs Memorial Library contained about 127,000 volumes, and the Hirst Library about 11,500 volumes. A dormitory accommodating 244 students was under construction to be completed in 1926. President, the Rev. Charles W. Lyons, S.J.

**GEORGE WASHINGTON UNIVERSITY.** A coeducational institution of higher education at Washington, D. C.; founded in 1821. For the fall of 1925 the enrollment in the various colleges was as follows: Graduate School, 362; Columbian College, 2599; College of Engineering, 513; Teachers College, 512; Medical School, 270; Law School, 804; College of Pharmacy, 27; the total amounting to 5087 students. There were 1850 students enrolled in the 1925 summer session. The faculty was increased to 380 members during the year. Productive funds amounted to \$784,752.11, and an income of \$22,492.12 came through endowment funds during the year, while there was a total income from general funds of \$745,250.82. The number of volumes in the general library approximated 65,000; in the law library, 10,000; in the medical library, 2000. Stockton Hall, the new law building, was completed during 1925 at a cost of \$300,000, thereby providing one of the units of the new University plan. A new administration building was acquired by purchase for the sum of \$30,000. President, William Mather Lewis, A.M., LL.D.

**GEORGIA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,895,832. The estimated population on July 1, 1925, was 3,058,260. The capital is Atlanta.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops, in 1924 and 1925:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1924	3,975,000	45,712,000	\$51,197,000
	1925	3,895,000	41,676,000	41,676,000
Wheat	1924	76,000	722,000	1,220,000
	1925	99,000	1,010,000	1,893,000
Oats	1924	275,000	4,262,000	4,049,000
	1925	413,000	7,021,000	6,108,000
Hay	1924	763,000	404,000 <sup>a</sup>	7,628,000
	1925	580,000	193,000 <sup>a</sup>	4,026,000
Potatoes	1924	20,000	1,440,000	2,160,000
	1925	17,000	833,000	1,749,000
Sweet potatoes	1924	100,000	7,000,000	7,000,000
	1925	110,000	5,170,000	6,462,000
Tobacco	1924	40,000	31,080,000 <sup>c</sup>	8,267,000
	1925	67,000	48,039,000 <sup>c</sup>	7,206,000
Peanuts	1924	399,000	239,400,000 <sup>c</sup>	10,055,000
	1925	278,000	132,050,000 <sup>c</sup>	4,490,000
Cotton	1924	3,089,000	1,003,770 <sup>b</sup>	109,250,000
	1925	3,661,000	1,150,000 <sup>b</sup>	112,217,000 <sup>d</sup>

<sup>a</sup> tons, <sup>b</sup> bales, <sup>c</sup> pounds, <sup>d</sup> estimate.

**MINERAL PRODUCTION.** The mineral products of the State in the order of their value, are

clay products, stone, cement, and fuller's earth. The value of the clay products in 1923 was \$5,739,128, compared with a value in 1922 of \$4,157,601. The production of stone in 1923 was 563,910 short tons, valued at \$3,942,294, compared with 444,590 short tons, valued at \$3,349,293 in 1922. The coal production of the State in 1923 was 75,620 short tons, valued at \$327,000, compared with 60,636 short tons, valued at \$246,000 in 1922. The total value of the mineral products of the State in 1923 was \$14,300,313, compared with a value in 1922 of \$11,120,018.

**FINANCE.** According to the summary of the United States Department of Commerce, the payments for maintenance and operation of the general departments of the State for the fiscal year ending Dec. 31, 1924, amounted to \$14,314,036. Additional payments for interest on debt and for permanent improvements brought the total to \$19,468,016. The per capita expenditure for maintenance and operation was \$4.73 in 1924, compared with \$4.07 in 1923 and \$2.48 in 1917. The largest single expenditure was \$7,002,890 for the construction and maintenance of highways.

The total revenue receipts for the fiscal year amounted to \$20,239,843, which was \$5,687,509 more than the total payments excluding those for permanent improvements, and \$771,827 more than the total payments. Of the total revenue, property and special taxes represented 32.3 per cent in 1924. These amounted, per capita, to \$2.16 in 1924, \$2.05 in 1923, and \$1.93 in 1917. In addition to the receipts from property and special taxes, revenue was derived from business and non-business licenses and from the earnings of the general departments. The net indebtedness of the State in 1924 on Dec. 31, 1924, amounted to \$6,260,702, or \$2.07 per capita, compared with \$2.30 in 1923 and \$2.14 in 1917. The assessed valuation of property in the State in 1924 was \$1,213,423,073. The State taxes levied amounted to \$6,067,115, or \$2 per capita.

**TRANSPORTATION.** The railway mileage at the end of 1924 was 7195. There were constructed during the year 1.6 miles of first track, and 39.8 miles of second track, or a total of 41 miles.

**MANUFACTURES.** According to the summary of the biennial census of manufactures taken in 1923 and published in 1925, the value of products of the manufacturing establishments of the State in 1923 aggregated \$604,450,000, compared with \$381,297,000 in 1921 and \$693,237,097 in 1919. The increase in the last named year was due in a large measure to changes in industrial conditions brought about by the World War. The average number of wage earners employed in 1923 was 137,383, compared with 98,264 in 1921 and 141,012 in 1919. The "cotton goods" industry is the leading one in Georgia, measured both by the number of wage earners and by the value of products. The value of the product was \$201,860,000 in 1923, compared with \$104,984,000 in 1921 and \$192,186,000 in 1919. The number of establishments whose output was \$5000 or more increased from 2809 in 1921 to 3057 in 1923.

**EDUCATION.** The most notable feature of educational development in the State during 1925 was the successful fight before the General Assembly led by the Georgia Educational Association for better schools. This resulted in the

appropriation of \$5,000,000 for the public schools and the passage also of a budget bill and a measure creating the office of high school inspector. A measure was also enacted providing for better support of higher institutions. A provision of \$1,000,000 for equalization was lost, but the vote which was received indicates its future passage. The school population of the State for 1923 was 900,352. The total enrollment in 1924 was 703,570 pupils, 445,896 being white and 257,674 colored children. The enrollment in the elementary schools, in 1924, was 639,591, and in the high schools, 63,979. The expenditure for public education during 1924 amounted to \$17,356,210. The average monthly salaries for teachers in the same year was \$97.88 for the white, and \$49.41 for the colored teachers.

**CHARITIES AND CORRECTIONS.** The State charitable and correctional institutions include training schools for boys, a Confederate Soldiers' Home, State Sanitarium, Training School for Mental Defectives, Academy for the Blind, School for the Deaf, and a State Tuberculosis Sanitarium. In 1925 the Department of Public Welfare prepared an extensive survey of crime, and the work of the courts for the Institute of Criminal Law. The legislature of 1925 passed a Child Labor Act forbidding children under 14 to work in factories, and under 16 in specified occupations or at night.

**LEGISLATION.** Counties were given power to build and operate public utilities, if the people approve the amendment to the constitution which confers the power. This amendment permits the county to acquire water power sites and build dams, to acquire points for generating electric current, and to sell water power and electric current. A State Board of Forestry was created consisting of the governor, certain other officers, five citizens appointed by the governor, representing women's civic organizations, and four members representing interests concerned in forests. Only qualified voters in the county where the meeting was held were permitted to attend any kind of political or mass meeting, and such meetings were to be held in the court house, after due notice had been posted on its doors. A Child Labor Act was enacted which forbids children under 14 to work in factories, and under 16 in certain specified occupations or at night. A certificate is necessary for children between 14 and 18, showing that the child is physically fit to follow the employment.

**POLITICAL AND OTHER EVENTS.** The legislature met in 1925, and the most important measures enacted are noted above. There were no elections or other political events of unusual interest. Early in the year considerable attention was directed to the Great Stone Mountain Memorial project near Atlanta. Gutzon Borglum, the famous sculptor, had entered into an agreement to carve on the face of Stone Mountain a memorial to the southern army in the Civil War. He carried on this work for several years when complaint was made by those in charge of dilatoriness and other faults in connection with the work by Mr. Borglum, and he was requested to discontinue the work in May. Heat was added to the discussion by the act of Mr. Borglum in destroying the models from which the work was to be done. Threats of his indictment on various charges were made,

but were not carried out. Following Mr. Borglum's abandonment of the work, Augustus Lukeman was appointed to succeed him in completing the memorial.

**OFFICERS.** Governor, Clifford Walker; Secretary of State, S. G. McLendon; Attorney-General, George M. Napier; Treasurer, W. J. Speer; Auditor, S. J. Slate; Comptroller-General, W. A. Wright; Superintendent of Education, N. H. Vallard; Commissioner of Agriculture, J. J. Brown; Commissioner of Commerce and Labor, H. M. Stanley.

**JUDICIARY.** Supreme Court: Chief Justice, Richard B. Russell; Associate Justices, Marcus A. Beck, Samuel C. Atkinson, H. Warner Hill, S. Price Gilbert, James K. Hines.

**GEORGIA (GEORGIAN SOCIALIST SOVIET REPUBLIC).** One of the three Transcaucasian republics that emerged after the Russian Revolution of 1917. After 1918 it was an independent republic; since 1921 it has been known as the Georgian Socialist Soviet Republic, and with Azerbaijan and Armenia, forms the Transcaucasian Federal Republic which is affiliated with the Union of Soviet Socialist Republics (See RUSSIA). Georgia is situated in Transcaucasia between the Black and Caspian Seas and is bounded on the north by the Caucasus, on the east by the Republic of Azerbaijan, on the south and southwest by Armenia and Turkish territory. Capital, Tiflis. Area, 25,760 square miles; population at the end of 1923, 2,372,403. The chief cities with their latest available populations: Tiflis, 246,766; Kutais, 85,151; Sukhum, 61,974; Poti, 20,731. At the end of 1923 there were 1788 schools with 195,799 pupils.

About 90 per cent of the people are engaged in agriculture, the chief pursuit. The methods are very primitive. The large estates have been divided among the peasants, the minimum allowance for any one family being about 17 acres. Corn is the chief crop, but vine growing is carried on extensively, and the country is also rich in fruits. Statistics on production are unavailable, aside from the general statement that the annual production in 1923 was 7,800,000 poods as compared with 66,000,000 poods before the war. The country has great possibilities for the breeding of cattle, the number being estimated at 12,000,000 head. Silk production and the keeping of bees survive from the old industries of the country. The chief mineral production is that of manganese, around Tchiaturi, where the greatest deposits of this mineral in the world are found. Production, which had been about 66,000,000 poods annually before the War, fell to 3,300,000 in 1919 but rose to 7,800,000 in 1923. Other mineral products are naphtha, coal, copper ore, lead, and iron ore. All the basic industries were nationalized by the Soviet régime. The railways of the republic, which are all state-owned, total 970 miles.

**GEORGIA SCHOOL OF TECHNOLOGY.** A State institution of higher education at Atlanta, Ga.; founded in 1888. For the fall of 1925 the total number of collegiate day students was 1871. The registration in the summer school for the year was 458. The number of members on the faculty in the fall of 1925 was 140. The endowment of the institution amounted to \$200,000, and the income from appropriations and fees was \$398,000. During the year

a \$100,000 addition was made to the chemistry building, and a new dormitory, the Julius Brown Memorial Hall, was constructed at a cost of \$85,000. The library contained 16,026 volumes. President, Marion Luther Brittain, LL.D.

**GEORGIA, UNIVERSITY OF.** A State institution of the higher learning at Athens, Ga.; founded in 1801. The enrollment for the fall of 1925 was 1401, a decrease in attendance over the preceding year caused by the United States government ceasing its programme of rehabilitation of soldiers. There were 1583 students registered in the 1925 summer session. The faculty numbered 91. The productive funds of the institution amounted to \$425,000, and the income for the year from the State and other sources was \$275,000. The library contained 57,000 volumes. An athletics and basketball building was erected during the year at a cost of \$38,000. Acting Chancellor, Charles M. Snelling, Sc.D.

**GERICKE, WILHELM.** An Austrian conductor, died in Vienna, October 27. He was born at Graz, Apr. 13, 1845. After completing his studies at the Vienna Conservatory, in 1865, he began his career as conductor at the Opera in Linz. In 1874 he became second conductor at the Vienna Court Opera. He succeeded Brahms, in 1880, as conductor of the Singverein and the concerts of the Gesellschaft der Musikfreunde. Colonel Higginson, hearing him in Vienna, secured him as conductor of the newly established Boston Symphony Orchestra. Serving 1884-89, Gericke made that organization not only the finest at that time in the United States, but also the peer of the most famous European orchestras. He returned to Vienna and the conductorship of the Gesellschaft, remaining till 1895. From 1898 to 1906 he once more directed the Boston orchestra and then retired from all musical activity. Gericke was a strict disciplinarian and an exacting drill-master, with a passion for absolute perfection and an extraordinary sense of tonal balance and euphony. As a composer he cultivated the forms of chamber-music. He also wrote a *Requiem*, a concert overture and an operetta, *Schön Hannechen* (Linz, 1865).

**GERMAN COLONIES.** All the overseas possessions of Germany in Africa, the Pacific Ocean, and the Far East were captured by the Allies during the World War. In Africa they included German East Africa, German Southwest Africa, Kamerun, and Togo. All these were divided between France and the British Empire, Southwest Africa being annexed to the Union of South Africa. In the Pacific were New Guinea, including Kaiser Wilhelm's Land, Bismarck Archipelago, German Solomon Islands, Nauru, Caroline Islands, Marshall Islands, Marianne or Ladrone Islands (with the exception of Guam); and German Samoa. In the Far East, there was only the German possession of Kiaochow. The total area of the German colonies was estimated at 1,140,117 square miles and the total population was estimated at 13,258,000. See the principal titles mentioned above, TANGANYIKA TERRITORY, and KENYA COLONY.

**GERMAN EAST AFRICA.** A former German colony, now administered by Belgium and Great Britain. It is located on the coast of Africa and extends from the Indian Ocean to

Lakes Victoria Nyanza, Tanganyika, and Nyassa, lying to the south of Kenia Colony and Protectorate. After the war it passed under the control of Belgium and Great Britain under mandates of the League of Nations. The Belgian share included the province of Rurundi Urundi under a royal commissioner of the Belgian government with headquarters at Kigali. The British portion is known as Tanganyika Territory (q.v.). For a settlement of the boundary dispute between Great Britain and Belgium see the YEAR BOOK for 1923.

**GERMAN EVANGELICAL SYNOD OF NORTH AMERICA.** See EVANGELICAL SYNOD OF NORTH AMERICA.

**GERMAN LANGUAGE.** See PHILOLOGY, MODERN.

**GERMAN LITERATURE.** With every year that has elapsed since the war which shook the very foundations of Europe and unsettled the whole world, it was becoming more and more apparent that the German mind had not yet adjusted itself to the new order, political and social. The feverish activity of the country's poets was with very few exceptions out of proportion to the results achieved. Fiction, drama and poetry suggested a lack of co-ordination between the creative impulse and the medium of expression. Even the work of scholars who so assiduously kept the younger generation in touch with the classics seemed to be affected by the shifting of standards. There was a perceptible decrease in works dealing with the classics and in new editions of their works; it was especially noticeable in the attitude towards Goethe, who always figured largely on the book market, and Schiller and Lessing were decidedly ignored. On the other hand a certain mutual appreciation was responsible for books on contemporary German authors whose permanent place in the literature of the country was by no means assured.

**FICTION.** The preponderance of fiction over other literary forms in 1925 was appalling. It outnumbered all other production beyond reasonable proportion. Is it the mental depression of which we hear so much that makes people seek diversion in the reading of innumerable novels and *Novellen* of the greatest variety in matter and manner? Among the novelists whose names have been familiar to readers for the past 20 years and more, Jacob Wassermann has become an outstanding figure and seems to have reached a climax in his creative activity. As in 1924 he has again given us two novels. The first of these: *Faber or the lost Years* had already appeared in an English translation, and *Landin und die seinen*, dealing with the ever timely marriage problem, was sure to follow. Max Brod, too, had two novels to his credit: *Leben mit einer Göttin* and *Reubens, der Fürst der Juden*, a story of the renaissance. Robert Hohlbaum, who had always been distinguished more for the quantity than the quality of his work, also produced two novels: *Der Frühlingsswaller* and *Der Weg nach Emmaus*. Georg Hermann, whose fiction effectively exploits middle class Berlin of the mid-century, figured on the list with a story of Jewish life: *Der kleine Gast*. Arthur Schnitzler added *Fräulein Else* to his gallery of women. Georg von Opperta turned from his special field, the life of the German nobility before the war, to the past: *Ernst III* is a historical novel. Walter von

Molo, the Austrian novelist, finished his trilogy on Prussian history, and had already written a sequel to his story *Auf der rollenden Erde*. Timm Kröger after an interval of silence reappeared with a novel entitled *Daniel Dark*. Karl Hans Strobl's new novel bore the romantic title: *Das Geheimniss der blauen Schwestern*. Max Dreyer had forsaken the drama in which he once promised to excel: his latest work was a college story: *Das Gymnasium von St. Jürgen*. Adam Beyerlein, who by a decade or more anticipated the anti-militaristic literature of today, still exploited army types in his *Kürassier von Guttenzell*. Gustav Meyrink's irresistible humor asserted itself in *Die heimtückischen Champignons*. August Sperl's *Der Bildschnitzer von Nürnberg* owed much of its effect to the picturesque setting of his story.

Among the younger men Hans Franck published a story with the curious title *Mutter, Tod und Teufel*; Hans Brandenburg an idyl entitled *Pankraz, der Hirtenbub*, Hans Johst a novel of Spitzbergen: *Consuela*; Gustav Renker a story of 16th century religious struggles in Carinthia: *Das Volk ohne Heimat*, and Albert H. Rausch: *Vorspiel und Fuge*, the story of a creative life. Short stories came from Klaus Mann, a son of Thomas Mann: *Vor dem Leben*; from Emil Ertl: *Teufelchen Kupido*, tales of married life, and Wilhelm Schmidtboun: *Die unerschrockene Insel*. Willy Seidel attracted attention by a story of psychic experience: *Der Küfig* and a Utopian tale *Der Gott in Treibhaus*. Among the women writers Helene Böhlau was perhaps the most individual figure for several decades: her story *Die leichtsinnige Ehe liebste* was a fair specimen of her quaint humor. Toni Schwabe chose as her heroine Goethe's last love: *Ulrike*. Sophie Hochstetter called her stories of the time of the great Frederick: *Der Weg nach Sanssouci*; her latest novel, *Das Kind von Europa*, dealt with Kaspar Hauser. Clara Viebig's latest novel was entitled *Die Passion*. The most discussed novel of the year *Der Kopf*, by Heinrich Mann, the gifted brother of Thomas Mann uttered a protest against the hypertrophy of the brain, and was a typical work of his keen and independent mind.

**DRAMA.** Gerhart Hauptmann's name naturally headed the list of new plays; but his *Veland der Schmied* treated the old story from a modern psychological standpoint and was less palatable than the original. Franz Werfel's *Jaures und Maximilian* was a noteworthy addition to historical drama. Fritz von Unruh's *Heinrich aus Andernach*, a play written for the centenary of the Rhinelands, held a broad human idea and was distinguished by caustic wit and strong characterization. Ernst Toller's latest opus, a two-act play for marionettes, was called *Die Rache des verhöhlten Liebhabers oder Frauen list und Männerlist*. Georg Kaiser's excursion into Malthusianism and birth-control, *Gats*, was hailed as the most important work of the Vienna season. Carl Sternheim's latest play has *Oscar Wilde*, Alfred G. Nagel's *Karfreitag* Strindberg as hero. Wolfgang Petzel's *Lassalle*, a tragic comedy, suggests familiarity with Meredith's novel. F. Walther Ilges in his *Babylon* presented a dramatic picture of a world debacle. Wilhelm Stücklen's *Sie selber nennt sich Hel singe* was pronounced by critics a very unusual play. Two historical dramas claim attention. Bernhard Kellermann's Anabaptist drama: *De*

*Wiedertäufer von Münster*, and Hanna Rademacher's three-act play of old Nuremberg: *Willibald Pirckheimer*. Karl Schönherr's latest play is *Die Hungerblockade*. Walter von Molo has added a play to his long list of works: *Lebensballade*.

**POETRY.** All poets of the generation which had been identified with the Young Germany of the nineties, seemed to have lapsed into silence. Only a few that formed a transition link were still occasionally heard from; among them were Franz Diederich, whose last volume of verse bears the cheerful title *Jungfreudig Volk* and Gustav Schüller who sounds a no less optimistic note in *Meine grüne Erde*. Alfons Paquet, the traveler poet, called his latest book *Amerika*. Of the new voices that challenge attention Johannes Becher was the most discussed. His expressionist verse was somewhat radical of tendency, which caused him to be arrested by the censor for the publication of the poem *Der Leichnam auf dem Throne*. A reader who recited selections from Becher's verse received a prison sentence. An interesting figure was the tinsmith-poet Heinrich Lersch, whose latest book is called *Mensch in Eisen*. Other volumes of verse came from Fritz Walter Bischoff, Bernhard Brentano, Alfred Hein, Friedrich Schreyvogel, Siegfried von der Trenck, Hanns Johst and others.

**LITERATURE CRITICISM.** etc. Among the numerous publications of this kind some were of great interest. Foremost among them was *Der Kampf mit dem Dämon*, an analysis of the characters of Hölderlin, Kleist and Nietzsche, by Stefan Zweig, who in America was known by his book on Verhaeren and the biography of Romain Rolland. Another valuable work was *Die Jեսussage* by Georg Brandes. Julius Meyer Graefe, the art critic, published a volume of essays: *Die doppelte Kurve*. Friedrich Schönmeyer was the author of *Mark Twain als literarische Persönlichkeit*. Hermann Drahn was the author of *Stefan George, seine Religiosität, seine Ethik*. Theodor Kapstein had written *Einführung in Friedrich Nietzsches Zarathustradichtung*, and Robert Reininger: *Friedrich Nietzsches Kampf um den Sinn des Lebens*. Of interest to the student of German literature were Hermann Schneider's *Heldendichtung, Geistliche Dichtung, Ritterdichtung*, Karl Borries's *Die Romantik und die Geschichte*, Dr. Albert Koster's *Die deutsche Literatur der Aufklärungszeit*, Albert Soergel's *Dichtung und Dichter der Zeit im Banne des Expressionismus* and Emil Ermatinger's *Deutsche Lyrik seit Herder*.

Works pertaining to drama are *Das deutsche Drama*, edited by Robert Tarnow, with Julius Bab and Albert Ludwig as collaborators; Max Krell's *Das deutsche Theater der Gegenwart*, Alfred Winterstein's psychoanalytic study of the Greek stage: *Der Ursprung der Tragödie*. A very interesting work was *Französischer Geist im neuen Europa*. Hans Prager was the author of *Die Weltanschauung Dostojewski's*. Goethe bibliography was enriched by Otto Pniower's *Goethe in Berlin und Potsdam*, H. N. Korff's *Die Lebensidee Goethes*, and Helene Goldschmidt's *Das deutsche Künstlerdrama von Goethe bis Wagner*. A work of unique interest was H. N. Koster's *Verbotene Literatur von der klassischen Periode bis zur Gegenwart*. The centenary of *Jean Paul* produced volumes by Johannes Alt, Walter Harisch and Friedrich Burschell;

that of *Adalbert Stifter*, books by Otto Stoessel and Hans Amelung. Other works of that character were Dr. Harry Maync's *Conrad Ferdinand Meyer*, Georg Stecher's *Casar Fleischlen*, Arthur Eloesser's *Thomas Mann*, Carl Hagemann's *Oscar Wilde*, Fritz Adler's *Woldemar Bonsels*, Rudolf Borchardt's *Wilhelm Schmidtbonn*, and Fritz Detmer's *Ludwig Thoma*.

**HISTORY, MEMOIRS, LETTERS.** Of interest to American readers may be Georg Friderici's *Der Charakter der Eroberung und Entdeckung Amerika's durch die Europäer*. J. G. Droysen published *Alexander der Grosse und seine Zeit* and Kurt Kaser *Das späte Mittelalter*. Emil Ludwig and Friedrich Kircheisen wrote lives of *Napoleon*, Otto Strobl: *Richard Wagner und sein Schaffen*, and Rudolf Stratz: *Kaspar Hauser*. Karl Atzenwerk had two interesting memoirs to his credit: *Die deutsche Pompadour* is a life of the Countess Lichtenau, the mistress of King Frederick II of Prussia, and *Pauline Wiesel* the story of the sweetheart of Prince Louis Ferdinand of Prussia. Reminiscences of *Robert Schumann* were presented by his daughter Eugenie. Ludwig Schemann wrote a life of *Cherubini*. *Die Meister des Hauses* was an autobiography of Oscar A. H. Schmitz. *Rahel Varnhagen und Alexander von Marwitz* was a volume of letters edited by Heinrich Meissner. Other works of this kind were the love-letters of *Detlev von Liliencron*, letters and diaries of *Maw Dauthendey* and a new volume of the correspondence of *Richard Wagner*. Of special interest were the letters of *Ferdinand Lassalle*, which cover the years of his labor propaganda.

**MISCELLANEOUS.** Philosophy and religion were the subjects of many new works. Foremost among them were Hans Meyer's *Geschichte der alten Philosophie*, Franz Brentano's posthumous volumes: *Versuch über die Erkenntnis* and *Psychologie vom empirischen Standpunkt*. Count Keyserling edited a symposium on marriage: *Das Ehebuch*. Alexander von Gleichen-Russwurm, whose works on social customs and manners were unique, published a new book: *Von Art und Unart*. *Ein Zeitspiegel des guten Tons*. Karl von Schlözer's *Menschen und Landschaften* and Edgar Dacqu's *Urwelt, Sage und Menschheit* offered food for thought.

Important publications on art were two books by Wilhelm Hausenstein: *Carpaccio und Rembrandt*, Dr. W. R. Valentiner's *Rembrandt* comprising five volumes of drawings, Curt Weigel's *Giotto*, and Ernst Roth's *Die Grenzen der Künste*. Interesting works were Ernst Borschmann's *Chinesische Baukunst* and Rolph Grosse's *Die holländische Landschaftskunst*. Among the books on travel Heinrich Vogeler-Worpwede's *Reise durch Russland* was distinguished by the author's illustrations; Fritz von Unruh's *Flügel der Nike* by its spiritual outlook and fascinating style.

**NEW EDITIONS.** There were fewer editions of the classics than in other years. But contemporary authors have lived to see their collected works, among them the Swiss novelist *Ernst Zahn*, the gifted poet *Isolde Kurz*, and *Clara Viebig*. Posthumous collections of *Casar Fleischlen* and *Maw Dauthendey* are valuable as documents of their time.

**TRANSLATIONS.** The Germans have ever been indefatigable translators. During the year they put forth two volumes from the Chinese, several from the Greek, the works of Calderon, Rousseau,

Sjören Kierkegaard, Macaulay, Wilde, Bourget, de Bos, Unamuno, Ossendowski, Bertrand Russell, D. H. Lawrence, and even the History of the World by Wells. American writers were especially favored. To Bret Harte, Jack London and Upton Sinclair, who have always been popular, they added Sinclair Lewis, van Loon, Lewisoohn, Dreiser, O'Neill, Henry Ford and others. Even works on economic problems of the day, like those of Vanderlip and Filene, were published in German.

**ANTHOLOGIES, CALENDARS.** Among the anthologies of contemporary verse were *Verse der Lebenden*, German lyric verse since 1910, two collections of Rhenish poetry, one of North German and Albert Sergel's *Saat und Ernte*: the poetry of the year 1925 in selections by the authors themselves. Even prose works were being presented in that form: *Das Jahrbuch deutscher Erzähler 1925* contained contributions by Johannes Schlaf, Rudolf Huch, Karl Hans Strobl, Kasimir Edschmid, Wilhelm Fischer, Josef Ponten, Willy Seidel and others, and *Die Welt in Novellen* was a two volume collection of short stories by German, Scandinavian, Anglo-Saxon, Slav, Romanic and other authors.

**NECROLOGY.** The following writers died within the year: Elizabeth von Heyking, the novelst who once made a sensation with her novel: *Briefe die ihn nie erreichten*; Isabella Kaiser, a Swiss novelist who wrote in French and German; Mathilde Mann, *lektor* at the university of Rostock, and a translator from Scandinavian languages; Wilhelm Speck, the novelist; Rudolf Steiner, editor, critic, philosopher, and founder of the anthroposophic movement; Max Bernstein, lawyer-dramatist, husband of Elsa Bernstein, who as Ernst Rosmer is known as novelist and playwright; Paul Marsop, musical historian and critic; Moeller van den Bruck, literary critic, essayist; Emma Haushofer-Merk, novelist; Jakob Heer, Swiss novelist; Moritz Heimann, author and reader for S. Fischer, and Gustav Kadelburg, author of popular comedies.

**GERMAN NEW GUINEA.** This name was applied to all the German territories in the western Pacific. (See GERMAN. COLONIES.) They were distributed by the Treaty of Versailles as follows: Those north of the Equator, viz., the Caroline, Marshall, Pelew, and Ladrone Islands, to Japan, under mandate; those south of the Equator, viz., the Bismarck Archipelago, the German Solomon Islands, former German possessions on the island of New Guinea, to Australia, under mandate of the League of Nations. All German possessions grouped under the name of German New Guinea were formerly administered from Rabaul, the capital, in the northeastern part of New Guinea. See also preceding YEAR BOOKS.

**GERMAN PATENTS.** See CHEMISTRY, INDUSTRIAL.

**GERMANY.** A federal republic of Central Europe, constituted after the abdication of Kaiser William on Nov. 9, 1918; and organized under the constitution of July 31, 1919, by the National Assembly at Weimar, elected in January of that year; formerly the German Empire; bounded on the north by the Baltic Sea, Denmark, and the North Sea; on the west by the North Sea, Netherlands, Belgium, Luxembourg, and France; on the east by Austria, Czecho-Slovakia and Poland; and on the south by Switzerland, Austria, and Czecho-Slovakia.

The German Empire consisted of 25 Federal states and the Imperial Territory or Reichsland; the Federal republic consists of 18 republics. Capital, Berlin.

**AREA AND POPULATION.** According to the census of Oct. 8, 1919, the area of the republic was 182,213 square miles and the population 59,852,682, of whom 28,496,419 were males and 31,356,263 females. The following table from the *Statesman's Year Book* of 1925, gives area and population, according to that census, as revised down to March 31, 1923:

States of the Republic	Area English sq. miles	Population Oct. 8, 1919 Total	Pop. per sq. mile 1919
Prussia *	113,688	36,690,549	323
Bavaria * (with Coburg)	29,506	7,140,333	242
Württemberg	7,532	2,513,773	334
Baden	5,819	2,208,503	397
Saxony	5,789	4,663,298	805
Mecklenburg-Schwerin	5,068	657,330	130
Thuringia	4,542	1,508,025	332
Hesse	2,968	1,290,988	435
Oldenburg	2,482	517,765	209
Brunswick	1,418	480,599	338
Mecklenburg-Strelitz	1,131	106,394	94
Anhalt	888	331,258	374
Lippe	469	154,318	329
Waldeck	401	55,999	137
Schaumburg-Lippe	130	46,357	354
Hamburg	168	1,050,359	6,564
Lübeck	115	120,568	1,048
Bremen	99	311,266	3,143
Total	182,213	59,852,682	328

\* Including the Saar.

The losses under the Treaty of Versailles (June 28, 1919) were as follows: (1) Alsace-Lorraine, returned to France, 5604 square miles with a population of 1,874,014; (2) a part of Eastern Silesia, the larger part of West Prussia, and a part of Upper Silesia (by Plebiscite), ceded to Poland, 17,787 square miles with a population of 3,853,354; a part of Upper Silesia, ceded to Czecho-Slovakia, 110 square miles and 45,396 population; Eupen and Malmédy, to Belgium, 386 square miles and 60,924 population; Memel, to the Allies, 1057 square miles and 140,746 population; Danzig to the Allies, made a free city, 794 square miles and 330,252 population. Provision was made to determine the status of certain regions by plebiscite: The Saar Basin, area 742 square miles, population 652,818, was to be under the League of Nations for 15 years, then to determine its destiny by plebiscite; Schleswig, to decide between Germany and Denmark; regions of the southern part of East Prussia, in West Prussia and in East Prussia. The plebiscite for Schleswig was held in March, 1920, when the northern zone, comprising 1537 square miles and a population of 166,895, decided for Denmark and was ceded to that country. The plebiscite in Upper Silesia, held in March, 1921, gave a majority for Germany, but the territory was divided according to vote, and 1255 square miles with a population of 891,669, was annexed to Poland.

The movement of population in 1923 was: Births, 1,333,621; deaths, 900,660; marriages, 582,725. In the same year the number of emigrants was 115,416, of whom 92,808 went to the United States, 8920 to Brazil, and 12,549 to other American countries. The cities with more than 500,000 inhabitants at the census of Oct. 8, 1919, were: Berlin (including suburbs), 3,803,770; Hamburg, 985,779; Cologne, 640,940;

Leipzig, 636,485; Munich, 630,711; Dresden, 587,748; and Breslau, 528,260.

**EDUCATION.** Instruction is free and compulsory throughout Germany between the ages of 6 and 14. According to the school census of 1922 there were 52,763 public elementary schools with 146,933 male teachers and 49,013 female teachers and 8,894,486 pupils. There were also 675 private schools of a similar nature with 35,584 pupils. For secondary education there were 515 *Gymnasias* for boys with 10,051 teachers and 153,607 pupils; 322 *Realgymnasias* with 6680 teachers and 115,615 pupils; 505 upper *Real* and *Real* schools with 8397 teachers and 184,007 pupils; 823 high schools for girls with 14,831 teachers and 299,190 pupils. For technical secondary education there were 10 technical high schools with 1783 teachers and 26,652 students in 1923. In addition there are veterinary, agricultural, forestry, mining, commercial, economic, science, art, and other special institutions.

The following table from the *Statesman's Year Book* of 1925, shows the number of universities, with the date of founding, and the number of professors, teachers, and students in 1923:

Universities	Professors and Teachers (1923)		Students 1923 Total
	Professors	Teachers	
Berlin (1809) .....	562		12,622
Bonn (1786-1818) .....	235		2,973
Breslau (1702) .....	217		4,179
Cologne (1888-1919) .....	129		5,270
Erlanger (1748) .....	102		1,845
Frankfort (1914) .....	202		5,032
Freiburg (1457) .....	191		3,080
Giessen (1607) .....	138		1,831
Göttingen (1737) .....	202		3,053
Greifswald (1456) .....	125		1,299
Halle (1694) .....	194		2,913
Hamburg (1919) .....	220		4,571
Heidelberg (1885) .....	194		2,673
Jena (1557) .....	159		2,881
Kiel (1665) .....	157		2,082
Königsberg (1544) .....	170		2,077
Leipzig (1409) .....	294		5,630
Marburg (1527) .....	142		2,855
Münich (1472-1826) .....	326		8,600
Münster (1780) .....	155		2,915
Rostock (1419) .....	100		1,183
Tübingen (1477) .....	128		2,925
Würzburg (1582) .....	118		3,425
Total .....	4,440		85,894

The students were divided among the several faculties as follows: Theology, 4369; Jurisprudence, etc., 37,720; Medicine and Dentistry, 14,626; Philosophy, 10,494; Mathematics and Natural Science, etc., 14,334; Auxiliary Science, 3831.

**PRODUCTION, ETC.** The following table from the same source as mentioned above shows the area under the principal crops in acres and yields in metric tons (one metric ton equals 2204 pounds) for 1923 and 1924, the figures for the latter year being preliminary estimates:

	Acreage		Produce (metric tons)	
	1923	1924	1923	1924
Wheat	3,695,535	8,666,190	2,897,072	2,536,959
Rye	10,911,890	10,629,559	6,681,514	5,998,027
Barley	8,251,472	8,613,182	2,361,160	2,392,922
Oats	8,858,940	8,814,505	6,106,958	6,134,548
Potatoes	6,814,352	6,904,625	62,579,980	36,402,000
Sugar				
Beet	980,890	985,967	8,696,119	10,266,600
Hay	18,611,850	18,629,005	23,354,613	23,240,700

In 1923 vines occupied an acreage of 186,692 and yielded 17,402,880 gallons of wine. According to the livestock census of Dec. 1, 1924, there were 3,849,600 horses; 17,296,300 cattle; 5,717,200 sheep; 16,843,500 swine; and 4,350,600 goats.

In 1924 the output of coal was 118,828,644 tons; of lignite, 124,359,829 tons; of coke, 23,719,541 tons. The following information on the production of nonferrous minerals was supplied by the United States Bureau of Foreign and Domestic Commerce. Of the mineral resources belonging to Germany in 1913, only the copper-ore reserves remained intact to that country since the post-war corrections of boundaries, and, even in the case of copper, potential supplies were removed with Germany's loss of its African colonies. The copper reserves within Germany centre in the Mansfeld-Hettstedt area, west of Halle-on-Saale, where the operating works produce about 1000 tons of copper monthly from their low-grade native ore. Some production elsewhere, as that in the Hartz, augments this figure. In 1913 the production from native ore amounted to 26,900 tons, but in 1923 it only reached 17,000 tons. The decrease is partly accounted for by the decline of output per unit of labor, and it is also true that 1923 was an abnormally low production year on account of the industrial disorganization following the Ruhr occupation. In view of the great importance of copper in industry, Germany was and is a potential importer, purchasing about 80 per cent of its foreign supplies in the United States. Germany's copper-ore reserves were once more important, but their exhaustion by mining has been progressive.

The zinc ore abundantly available in Upper Silesia has been lost to Poland, which acquired approximately 80 per cent of Germany's zinc reserves by the partition of that state. German production, amounting to 250,300 tons of zinc content in 1913, dwindled to 35,000 tons in 1923, the latest year for which production figures are available. Germany is importing Polish zinc ore heavily for refining in its remaining smelters, located chiefly in western Germany in the region of Aachen-Stolberg, where some zinc ore occurs contiguously with the famous Belgian Vieille Montagne deposits. German lead supplies from deposits in Upper Silesia were similarly cut down with the partition. A 1913 production of 79,000 tons lead content dropped to 28,000 tons in 1923. The remaining industry is also centred in western Germany, in the Bonn area on the left Rhine Bank.

In compensation for its copper shortage, Germany has developed a considerable aluminum industry, aluminum now being used to a great extent to replace copper in the country. Production by one plant has grown from 800 tons in 1913 to 20,000 in 1924. Four works, three of them built during the War, contributed to this output. With the new works on the Inn River in Bavaria now in operation a considerable increase in the future production should be recorded. Imports of copper from the United States, accordingly, can be expected to decrease. While the cost of aluminum by weight is about twice that of copper, aluminum's lower specific gravity (three and one-half times lighter than copper) makes it by volume about

40 per cent cheaper. There is, however, another consideration—the electrical conductivity of copper is about twice that of aluminum. Bauxite, the raw material for aluminum production, is neither abundant nor of high grade in Germany. The only local deposits in the Vogelsgebirge district are an aluminum hydro-silicate structure with 15 to 20 per cent metal content, the imported bauxite, mostly French and Istrian, being composed of alumina hydrate and iron hydroxide with 25 to 30 per cent metal content.

**COMMERCE.** The following account of Germany's trade was supplied by the United States Bureau of Foreign and Domestic Commerce. The record-breaking adverse trade balances of the first few months of 1925 and the necessity for increased exports of highly finished goods, if raw material purchases are to continue indefinitely, makes interesting a comparison of the foreign sales of the chief German export industries in 1913 and 1924, the first full year of currency stability. It shows that in the case of every important export industry the value of exports has been actually less; and if the decline in gold value since 1913 is considered, the 1924 figures are still less favorable. The three most important groups of export industry—namely steel and machinery, textiles, and chemicals and dyestuffs—have been particularly affected. Heavy industry is more dependent upon foreign raw materials than before, and the dye industry and some branches of the chemical trade have lost some of their best foreign markets through the development

terest rates have gradually declined and taxes have been gradually reduced.

The only important industries showing an increase in the actual value of exports for 1924 as against 1913 were the paper, porcelain, and fine mechanical goods (such as optical glass goods), but the woodworking industry diminished their import surplus. Textile equipment is the only machinery branch of which the export in 1924 exceeded the pre-war figure, although net exports were less. The poor showing of the German machinery industries is attributed to the wide development of competing industries abroad and the inability of German firms to grant long credits in competition with the United States and Great Britain. A considerable amount of the machinery export was undoubtedly due to the underbidding below domestic quotations. The showing of the electrotechnical industry was better than that of many other machinery branches, but it was believed that the 1925 exports can, because of growing foreign competition, be increased with great difficulty.

Steel, machinery, copper, and other metal-working trades, electrotechnical, textile, chemical, and leather are the chief export industries, and a total of their net exports shows an import surplus of 287 million marks in 1924, against an export surplus of 1387 millions in 1913. The following table shows the foreign trade in the principal German export industries:

Germany's trade is directed toward the Asiatic and American continents. Germany is de-

of foreign industries during the War. The textile industry also has suffered from the expansion of competitive industries in former important markets.

These are permanent factors adversely affecting German industry, but in addition there have been temporary conditions whose removal should in the future assist German export trade and industry to equal or exceed its pre-war net exports. These include the admission until Jan. 10, 1925, duty free, of metallurgical, textile, and other products from Alsace-Lorraine; the restrictive provisions of the Peace Treaty affecting Germany's ability to negotiate commercial treaties until the same date; the abnormal price levels which followed currency stabilization; and the extremely tight money market prevailing in 1924 which prevented the granting of as favorable credit terms for export as competing nations. While all these factors may be considered more or less temporary, there is as yet no indication of falling prices, although in-

veloping its markets in China, Japan, British India, and Latin America; but with the exception of the United States these markets are small relative to Germany's total foreign trade. Sales in Europe, Germany's largest market, are slightly less important than formerly. This is accounted for by the decreased shipments to Russia and the Balkans, which are no longer able to purchase German products in normal quantities, and by the lessened exports to France and Belgium where German goods have been seriously handicapped by tariff restrictions and political factors. A number of the neighboring countries, however, are taking an increased proportion, in particular the Scandinavian countries. The official figures for 1924 show total imports amounting to 9,318,841,000 gold marks and exports to 6,566,854,000 gold marks, leaving a net deficit for the year of 2,749,987,000 gold marks. This compares with 1913 figures of imports amounting to 11,206,000,000 gold marks, of exports amounting to

10,199,000,000 gold marks, and a net deficit amounting to 1,007,000,000 gold marks.

The German government is prosecuting a campaign to attain a favorable position in international trade, in spite of post war losses of raw materials. This programme involves a reduction in manufactured imports as a result of the new provisional tariff, and a cut in food-stuffs imports by a tariff protection of the domestic markets and an increase in German agricultural productivity which, it was hoped, would eventually approximate 30 per cent. In addition to the decline in imports, efforts to increase the volume of exports involve a reduction in the taxation of export industries, favorable financial terms to exporters, and a discount by the Raw Steel Cartel on the price of materials for manufacture and export equivalent to the difference between the high domestic and the world market levels.

**FINANCE.** The budget estimates for the fiscal year beginning Apr. 1, 1925, and ending Mar. 31, 1926, were as follows: Revenue and expenditure balanced at 6,380,616,863 gold marks. Total revenue for the first six months of the 1925 fiscal year, from April to September, amounted to 3,584,000,000 marks as compared with 3,299,000,000 marks for the same period during the previous year. This amounts to a surplus of 37 per cent over estimated revenues for the first half of 1925 as compared with an excess of 26 per cent over the estimated revenues of the same period for 1924. The comparison of the two periods is the more favorable in view of the notable reductions in taxation on commerce and industry that were effected during 1925. The two most important sources of income which bring in more than one-half of total taxation revenues are the income tax and the turnover tax. The income tax was reduced by 25 per cent during 1925, whereas the turnover tax was reduced from  $2\frac{1}{2}$  per cent to 2 per cent on Oct. 1, 1924, to  $1\frac{1}{2}$  per cent in January, 1925, and to 1 per cent on Oct. 1, 1925. The continued heavy revenues from these taxes, in spite of marked cuts, was an encouraging indication of the gradual increase in business turnover. Although the turnover tax yielded only 11 per cent more than estimates for the first six months of 1925, as compared with a surplus of 27 per cent for 1924, it was evident that only an important increase in total volume of turnover could have prevented a much greater decline in actual revenue.

The gradual transition from the taxation policy of the inflation and stabilization period to normal pre-war sources of taxation had involved an increasing burden upon German commerce and industry, which heavy taxation has been, for the greater part, passed on to the public in the form of higher prices. The increasingly vigorous control of the German administration over prices and business practice, has,

however, forced German business to absorb a certain part of the taxation burden. As a result, 1925 was characterized by a general passing of dividends in all branches of industry except those such as banking, public undertakings, breweries, etc., which, for special reasons, have avoided the effects of depression. Revenues from speculative enterprises have in large part declined, although during the inflation period speculative and transfer taxes formed the relatively greatest sources of revenues. The speculative element in German business is gradually disappearing, and with the gradual liquidation of firms founded during the inflation period, production and distribution will return to adequate turnover and the normal margin of profit thereby made possible.

One of the most significant tendencies in the trend of German revenues is their return to pre-war sources of income. In the 1924 fiscal year about 90 per cent of the budget income was derived from taxation, about 3 per cent from customs, and 0.1 per cent from public undertakings. In 1912, however, taxes formed only about 27 per cent of revenue; customs, 23 per cent; and public undertakings—the largest source of income in the budget—28 per cent. Although income from public undertakings is now excluded from the budget, these government-owned companies average a much higher dividend rate than similar private concerns; but, as they are not listed in the budget, they are not taken into account.

With the passage of the new tariff bill on Oct. 12, 1925, customs will again become one of the most important sources of revenue to the German government. As normal customs charges were not effective until Oct. 1, 1925, this source of revenue is not fully reflected in the figures given, although revenues from customs and excises are already 75 per cent above budget estimates as compared with a surplus of 17 per cent on practically the same amount in the previous year.

In spite of the superficially favorable appearance of German revenue figures, it is evident that the high surpluses obtained during 1924 and 1925 have been made at a real cost to industry and commerce. The question whether the present taxation burden is not too high to permit a stabilization of business comparable with the stabilization of public finance is one of the outstanding economic problems in Germany. With the increasing burdens under the Dawes plan, which rise to 2,500,000,000 marks per year commencing Sept. 1, 1928, it is evident that little hope can be entertained for a reduction in the actual amount of government receipts. In view of the unfavorable effect of the present rate of taxation, it appears inevitable that taxes continued on the present or on an increased scale can only be possible by increased business turnover in Germany.

**RAILWAYS.** The state railways form more than nine-tenths of the mileage in Germany, although under a provision of the Dawes plan they are operated by a private company. On Mar. 31, 1923, the total length of line was 34,317 miles.

**SHIPPING.** On June 30, 1924, the German merchant marine amounted to 2,953,671 registered tons. The accompanying table from the *Statesman's Year Book* for 1925 shows the number and tonnage of vessels entered and cleared according to nationality.

Shipments of freight on German inland waterways increased to a marked extent in 1924. During that year a total of 46,569,000 metric tons of goods arrived at various inland ports, as compared with 15,613,000 metric tons in 1923 and with 58,679,000 metric tons in 1913. In 1924 goods totaling 41,765,000 metric tons were shipped from inland German ports as against 17,013,000 metric tons in 1923 and 62,575,000 metric tons in 1913.

**GOVERNMENT.** Under the constitution of the republic adopted July 31, 1919, and promulgated Aug. 11, 1919, executive power is vested in the president elected by the people for seven years, and in a ministry appointed by him and responsible to the parliament or Reichstag. Legislative power is vested in the Reichstag, which is elected by universal, equal, direct, secret franchise of male and female electors, on the principal of proportional representation; and in an imperial council, the Reichsrat, consisting of 66 representatives (Prussia, 26; Bavaria, 10; Saxony, 7; Württemberg, 4; Baden, 3; other states, 16). The consent of the Reichsrat is required to all bills before their introduction in the Reichstag. In the Reichstag elected on Dec. 7, 1924, the seats were divided among the political parties as follows: Socialists, 131; Centre Party, 69; German Democratic Party, 32; Bavarian People's Party, 19; Communists, 45; and minor parties, 43.

The president at the beginning of the year was Friedrich Ebert (q.v.). He died on Feb. 28, 1925, and was succeeded by Field Marshal von Hindenburg. The cabinet as appointed on Jan. 15, 1925, was constituted as follows: Chancellor, Dr. Luther; Vice-Chancellor and Minister for Home Affairs, Herr Schiele; Foreign Affairs, Dr. Stresemann; Finance, Herr von Schlieffen; Defense, Otto Gessler; Labor, Heinrich Brauns; Food and Agriculture, Count von Kanitz; Posts, Herr Stingl; Transport, Dr. Krohne; Economics, Dr. Neuhaus; Justice and Minister for the Occupied Territories, Dr. Frenken.

#### HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** As noted in the preceding YEAR BOOK Chancellor Marx resigned on Dec. 11, 1924, rather than accept Nationalists into his cabinet. A political crisis ensued due to the inability of any leader to form a cabinet. It was not until January 15 that Dr. Luther was able to form a government the makeup of which is noted above under *Government*. This cabinet formed by Dr. Luther was distinctly a swing toward the right, and for the first time in the history of the republic the cabinet was predominated by conservative bourgeoisie. In his first speech Chancellor Luther outlined the policies he intended to pursue, which included the following items:

tariff and tax reforms; the carrying out of the Dawes plan; and the improvement of Germany's commercial and political relations with other countries. He stated that he had no intention or desire to overthrow the republic and restore the monarchy as many of his opponents declared, in fact, he would not only not countenance, but would combat every anti-republican movement. He strongly resented the imputations that Germany was carrying on military training in violation of the Treaty of Versailles. His speech was greeted with shouts of disapproval by the Communists who accused him of being the agent of the international capitalists and by the Socialists who said that his selection was merely the first step in the return of the monarchy. The Nationalists strongly defended the Luther government as did the People's Party. The Opposition fought among themselves when the Socialists and Communists accused each other of being responsible for the formation of the Luther government. There was undoubtedly a strong nationalist movement spreading over the country. This was particularly noticeable in Prussia where the Socialist Otto Braun, the head of the coalition government in that state was ousted from office and was unable to form a government when he was reelected to the office of premier. On the 66th birthday of the Kaiser the *Kreuz-Zeitung* printed the following statement: "Let us today vow never to rest until the old yellow imperial banner and the purple royal standard wave again over the ancient Hohenzollern palace in Berlin."

**DEATH OF PRESIDENT EBERT.** On February 28 Germany and the entire world was shocked by the death of Friedrich Ebert (q.v.), the first president of the German republic. He was buried with all the honors Germany could show him, and was undoubtedly beloved throughout his country. Practically every country in the world sent condolences to the government. His death created a considerable amount of unrest in Germany as well as in foreign countries. In France, particularly, he was considered a staunch friend of the Dawes plan and of complete recognition of Germany's responsibilities. His successor was an uncertain and an unknown quantity and it was feared in the Allied press that an attempt would be made to restore the monarchy, particularly in light of the leanings of the Luther cabinet. Dr. Luther assumed the position of president until relieved by Dr. Walter Simons, the head of the highest court. Political leaders determined to hold the elections on March 29, and if no one received an absolute majority it was proposed to hold another election on April 26 when only a plurality would be required.

**THE ELECTIONS.** After a campaign which was marked by the absence of demonstrations, but which was fraught with bitter personalities the elections for president were held on Sunday, March 29. The results were as follows: Jarres, Nationalist, 10,408,365; Braun, Socialist, 7,798,346; Marx, Centrist, 3,884,877; Thaelmann, Communist, 1,871,207; Hellpach, Democrat, 1,567,197; Held, Bavarian People's Party, 1,006,790; Ludendorff, 284,975; scattering, 34,245. As no one candidate had an absolute majority it was therefore necessary to hold another election on April 26. An analysis of the votes cast showed that the Republican Parties

(Socialists, Centrists, and Democrats) had a majority of the votes cast and if they could concentrate on one candidate would be able to defeat the Nationalist candidate.

A most dramatic incident occurred on April 8, which changed the entire complexion of the election. This was the announcement that Field Marshal von Hindenburg, who had twice refused to be a candidate, would contest the election. Hindenburg's nomination was supported by the following bloc, the Nationalists, the Bavarian People's Party, the Hanover Party, and the Peasants' Organization. The issue was a clear-cut one now between the right, led by von Hindenburg, and the left, led by former Chancellor Marx. In certain quarters the charge was made that Hindenburg consented to run because of the personal wishes of the former Kaiser. Although von Stresemann was bitterly opposed to the nomination of von Hindenburg he announced that his party (German People's Party) would support the Nationalist candidate.

When the second election was held on April 26, Hindenburg received 14,655,766 votes as against 13,751,615 for Marx, and 1,931,151 for the Communist, Thaelmann. An analysis of the vote showed that Hindenburg had received most of his support from the agrarian districts and Marx from the industrial centres. Once again the campaign was marked by bitter personalities and charges and countercharges were made of irregularities, bribery, and corruption. Some violence accompanied the election, notably in Berlin and Karlsruhe. The country received the results very calmly and took Hindenburg at his word when he stated that he was not the tool of any man and had no intentions of altering the form of government. He was inaugurated on May 12 by a very simple ceremony. The only act to mar its complete success was the marching out of the Communist members in a body at the time of the administration of the oath. Hindenburg said that his policy was the "non-partisan task of uniting and co-ordinating the nation's constructive elements for the common welfare of the German people."

**ALLIED MILITARY CONTROL.** On June 4 the Allied Military Control note arrived at Berlin and demanded the following measures as necessary to the disarming of Germany in accordance with the provisions of the Peace Treaty: reduction of the Schützpolizei (security police) from 180,000 to 150,000; the abolition of the national military organization of the police; the abolition of the German General Staff; the abolition of the nation-wide portable wireless system of the police; the abolition of secret training and gas experiments; and the destruction of the machinery in a number of factories used for war purposes. The note stated that the evacuation of the Cologne area hinged upon the complete compliance of the German government with the provisions stated above and denied that the continued occupancy of that district was a violation of the Treaty of Versailles or an act of reprisal. The note was bitterly attacked by the press and government of Germany who blamed the Allies and the military situation in the rest of Europe for the conditions complained about. For a discussion of the security pact and the Locarno treaties, see article **LOCARNO CONFERENCE AND TREATIES.**

**ADJOURNMENT OF PARLIAMENT.** The legislative body ended its sessions on the 12th of August. The government was partially successful in putting through its domestic policies before the close of the session, although for a time it seemed inevitable that the Luther ministry was doomed to fall. One of the most important measures passed during the last days was the so-called revaluation bill. This placed a new value on state loans of 2½ per cent of their face value. It is estimated that 70,000,000,000 marks in the form of bonds were affected by this new measure. It was an attempt to wipe out the evils of the inflation period. Other forms of loans such as mortgages, industrial bonds, etc., were also given a new value by the measure. The tax bill was adopted on August 7, and competent observers stated that it was the most thorough bill passed since the War. A tariff bill was also passed which placed Germany in the ranks of the high protectionists, virtually on the same basis as she was in 1903. These revenue measures were passed over the violent opposition and obstructionist measures of the Communists, who had to be expelled on two occasions by the police because the yelling and caterwauling prevented the carrying on of business. An amnesty bill in favor of all Nationalist political prisoners was passed and trade treaties with the United States, Norway, Greece, Belgium, and Portugal were ratified on the last day of the session.

**GERMANY AND THE LOCARNO PACT.** The Locarno Pact (q.v.) which was negotiated in Switzerland nearly precipitated a serious cabinet crisis in Germany. On October 25, Dr. Schiele, Minister of Interior, Herr von Schlieben, Minister of Finance, and Herr Neuhaus, Minister of Commerce, resigned their posts supposedly because of a conference of the Nationalist group which went on record as being opposed to any agreement which would prevent Germany from winning back by force of arms those territories she had lost as a result of the War. For a time it appeared certain that their action would force the entire cabinet to resign but the earnest solicitation of President von Hindenburg determined Chancellor Luther to remain at the head of the government. The three vacant positions were given to other members of the cabinet, he himself taking the ministry of finance. Later events showed that the Nationalists were not united in their opposition to the Locarno Pact, when some of their leaders came out in support of the measure. The ratification of the treaty depended in a large measure on securing the support of the Socialists and Luther did everything in his power to win them over to his side. His own public utterances were decidedly in favor of ratification.

On Armistice Day the Council of Ambassadors received the reply from Germany concerning disarmament. The German note agreed with the demands of the Allies and promised: the abolition of the post of Commander-in-Chief and the substitution of a civilian in place of General von Seeckt; the abolition of the general staff; the conformity of the security police in accordance with the wishes of the allies; the destruction of the remaining guns at Königsberg and the abolition of military training for the German youth. Because of the satisfactory nature of the reply the Council announced that the evacuation of the Cologne district would commence on Decem-

ber 1 and that of Coblenz and Mayence would be materially changed.

**RATIFICATION OF THE LOCARNO PACT AND RESIGNATION OF THE MINISTRY.** When parliament met on November 20 the two most pressing measures before it were the ratification of the Locarno Pact and the entrance of Germany into the League of Nations. On November 23, the Chancellor began the debate in favor of the pact, as well as Germany's entrance into the League. The chief opposition to the measures came from the Nationalists and the Communists, the Socialists deciding to support Luther in his campaign. The following letter from General von Ludendorff was published in the Nationalist press and serves as a general statement of the position of the Extremists. "Once I divided honor and glory with Field Marshal von Hindenburg and—I dare proclaim it to all aloud—heightened his glory. Today my German heart aches when I see how the Field Marshal is sacrificing that glory—and it is sacrificed, indeed, if his name stands under the document of shame and dishonor. Better to surrender one's position than glory, honor and one's own great past. That is the German way, and even more German would it appear for the Field Marshal to have given battle against this treaty of dishonor and enslavement. If the President really regards the Locarno policy as right, then must every German who is not soaked with black-red gold, or sold to Mammon, veil his head. Then the Field Marshal President has become a danger for the national will. His name does not belong under this treaty. That, at least, does he owe to his fellow warriors. We expect the Field Marshal not to sign, but to fight."

Despite this outburst of nationalist objections the measures were passed and the Locarno treaties were formally signed in London on December 1. Results as far as Germany was concerned were almost immediately noticeable. Belgium reduced her forces of occupation by two-thirds, the evacuation of the Cologne district was hastened and the end of Allied control in Germany was obviously in sight. The Socialists supported the measures of Luther with the understanding that as soon as they were ratified he would resign. This the Chancellor did on December 5, although he remained in office while the president made up his mind concerning a new Chancellor.

**GESLER, THEODORE A. K.** Baptist clergyman, died at Miami, Fla., December 4. He was born at Philadelphia Oct. 16, 1841, attended the Philadelphia High School, and after studying law privately in Philadelphia for a year, gained the degree of A.B. at Bucknell University in 1864. He studied divinity at Bucknell Theological Seminary 1863-64, and was ordained to the Baptist Ministry. At the time of Lee's invasion of Pennsylvania, he volunteered as a private in the Twenty-Eighth Pennsylvania Volunteers and went to the front. He was pastor of the Pilgrim Church, New York, 1864-68; and at the First Church, Elizabeth, N. J., 1868-79; at the Central Church, Brooklyn, 1880-86; and at Grace Church, New York, 1886-97. When he retired in 1897 his friends erected a church at Lake Hopatcong, N. J., and he was made its pastor in October, 1910. Bucknell conferred on him in 1883 the degree of D.D. He was president of the New Jersey Baptist Sunday School

Union, 1870-79; secretary of the Baptist Congress 1895-1912; president of the New York Alumni Club of Bucknell University from 1875.

**GIBB, SIR GEORGE STEGMANN.** A British railway manager. He was born at Aberdeen, Apr. 30, 1850, and educated at its grammar school and university. After practicing law until 1882 he became solicitor to the North-eastern Railway at York and later served as wage arbitrator in the railway wage dispute of 1897 and as a member of the Royal Commission on London traffic in 1903. He was general manager of the Northeastern Railway, 1891-1906 and a director, 1906-10. He became managing director in 1906 of the Underground Electric Railways Company of London and in 1910 Chairman of the Road Board. He served on the Government Arbitration Board, and was its Chairman in 1918.

**GIBRALTAR.** A British possession on a small peninsula, comprising the Rock of Gibraltar, on the southwest coast of Spain, commanding the entrance to the Mediterranean Sea. Area, 1½ square miles; population, according to the census of 1921, 20,638, of whom 2932 were military and 546 naval. On Jan. 1, 1924, the fixed population was estimated at 17,346, and there were also about 1469 aliens. The inhabitants were chiefly descendants of Spanish and Italian settlers, and in religion were Roman Catholics. Education is compulsory between the ages of five and 14. In 1923-24 there were 15 government-aided elementary schools, with 2646 pupils. There are also five secondary schools. The revenue in 1923 was £150,283 and the expenditure £167,088. Trade is mainly transit. Vessels entered in 1923, 4421 of 5,560,875 tons; cleared, 2831, of 5,253,416 tons. There is cable communication with the continent, with eastern Mediterranean ports, and with England. Gibraltar is under a governor, who is also commander-in-chief. He is assisted by an executive council which was established in 1922. Governor at the beginning of 1925, General Sir Charles C. Monro.

**GIFFORD, RALPH WALDO.** Professor of law at Columbia University, died December 2. He was born at West Dedham, Mass., Oct. 15, 1867, graduated A.B. at Harvard 1892, and LL.B. 1901. He served as an assistant at Harvard College Observatory 1886-88. In 1902 he was admitted to the New York Bar and practiced law at New York 1903-07. He was professor at Fordham University, 1906-12, and then went to Yale as Lines Professor of Testamentary Law, serving until 1915. Becoming professor in the Law School of Columbia University, he lectured there until his death. He held honorary degrees of A.M. from Yale and LL.D. from Fordham University.

**GIFTS AND BENEFACTIONS.** See UNIVERSITIES AND COLLEGES.

**GODLEE, SIR RICKMAN JOHN.** British surgeon and author, died April 20. He was born at Upton, Essex, Feb. 15, 1849, of Quaker parents and went to school at Tottenham, later graduating at the University of London in 1867 as B.A. At the University College he studied medicine, and in addition to his skill as a dissector was so excellent a draughtsman that he was employed to prepare the drawings for the plates of Quain's *Anatomy*. In 1872 he was admitted a member of the Royal College of Surgeons, and after taking the degree of Bachelor and Master

of Surgery at the London University was elected a fellow of the Royal College of Surgeons in 1876. After serving at the University College Hospital he studied at Edinburgh under his uncle, Lord Lister. He then served in London with various hospitals as surgeon, and in 1877 was appointed assistant demonstrator of anatomy in the Medical School of the University College Hospital, where he became surgeon and eventually consulting surgeon. In the University College after teaching for many years he became Emeritus Professor of Clinical Surgery. He filled all the usual offices at the Royal College of Surgeons and, 1911-13, was its president. He was Surgeon to the Household of Queen Victoria and Surgeon in Ordinary to King Edward VII and to King George V. He was created a baronet in 1912 and received the K.C.V.O. in 1914. He was not only a skilled surgeon but an artist, linguist, carpenter, poet, botanist, ornithologist, and oarsman. He wrote a biography of his uncle, *Life of Lord Lister* (1917).

**GODLEY, ALFRED DENIS.** British orator, died at Oxford, June 27. Born in Ireland Jan. 22, 1856, he studied at a private school in Dublin and at Harrow. Entering Balliol College, Oxford in 1872, he became one of its best classical scholars. He won many prizes in the classics and became master at Bradfield school, serving 1879-82. In 1883 he went to Magdalen College as assistant classical tutor and later was tutor and fellow. There he stimulated study of the classics. In 1890, becoming editor of the *Oxford Magazine*, he wrote for it a series of light verse, collected in 1892 under the title of *Verses to Order*, and in 1903 in a second volume under the same name. During the South African War he commanded a battalion, and in the War of 1914 he commanded the Oxford Volunteers. In 1910 he was appointed editor of the *Classical Review*, and elected public orator in the University. Called upon to deliver not only the Latin academic orations, but also many addresses in English, he spoke with unusual grace and felicity. He received the honorary LL.D. from Princeton in 1913 and honorary D.Litt. from Oxford in 1919. He was a walker and mountain climber, and vice-president of the Alpine Club in 1924. In addition to the books referred to he was the author of: *Aspects of Modern Oxford* (1893); *Socrates and Athenian Society* (1895); produced an edition of Tacitus' *Histories* (1887 and 1890); translated the *Odes of Horace* (1898); edited *Nova Athologia Oroniensis* (with Prof. Robinson Ellis, 1899); wrote *Second Strings* (1902); *Oxford in the Eighteenth Century* (1908); *The Casual Ward* (1912); and a translation of *Herodotus* (Loeb series, 1921-23).

**GOITRE.** According to Dr. F. H. Lahey (*Boston Medical and Surgical Journal*, September 10) it is an error to give iodine indiscriminately to subjects with goitre unless it has been shown that iodine deprivation has actually occurred. In regions where the disease is endemic and water and food analyses show that the patients are not receiving enough of this element routine exhibition is indicated. In Boston and vicinity the disease is not endemic and there is plenty of iodine in the diet, sea food being freely consumed. There are numerous ways in which sufficient iodine may reach the body and most goitre patients have already taken

it in some form of medication. In this class of patient the use of iodine is actually contraindicated for the simple non-toxic goitre may be transformed to the toxic form. Where there is actual iodine starvation the element may be added to the drinking water or table salt at the rate of one grain daily for one week out of every six months, purely as a preventive. When a toxic goitre is to be operated on the patient should receive iodine, for this will make it possible to operate in one stage, thus doing away with preliminary ligation of the blood vessels. The author no longer operated in two stages save in a small minority of cases. See also **FOOD AND NUTRITION**.

**GOLD.** South Africa during 1925 produced gold to the value of \$211,073,754, or 54 per cent of the world's production for the year; mining in that region having progressed satisfactorily during the year notwithstanding a shortage of native labor, in part compensated by the increased use of pneumatic drills. One of the evident conditions to which attention was called was that with the increased demands of the labor unions and restrictions by the government, the low-grade mines on the Rand would be in a less favorable position in the future. In 1925 in the United States the production of gold was approximately the same as in 1923 and 1924. The figures for these years being given at \$50,160,103 and \$50,570,294 respectively. It was believed that Alaska was the only part of the United States from which any substantial increase in the gold output could be looked for. Canada in 1924 had a gold production of \$31,532,403 which was an increase of \$6,238,325 over that of 1923. Estimates for 1925 placed the value of gold at \$35,768,000. Canada was in a very promising position as regards increased output as the mines in Ontario were increasing their yield, and though a decrease in the production from the Yukon was anticipated nevertheless the total output was bound to grow. In 1925 the Russian Soviet Government restored the Lena gold fields to their former owners and there was a possibility that these fields would be placed on an extensive producing basis. Australia and India continued to decline during the year, and Mexico was anticipated to show for the year an output of \$16,300,000, or approximately the same as in 1923 and 1924. It was interesting to note that in the period between 1913 and 1924 the world's gold production had amounted to \$4,723,078,189, but the world's stock of money had not increased by quite that amount as in 1924 it was estimated at \$9,669,000,000, an increase from \$5,293,000,000 in 1913. This would indicate that in 12 years \$347,000,000 of gold which had been mined was either hoarded or consumed in the arts and not used in currency. The world's monetary stock in 1924 was distributed as follows: Europe, \$3,278,000,000, or an increase of 17 per cent over 1913; the United States, \$4,547,000,000, or an increase of 138 per cent over 1913; and other countries, \$1,844,000,000, or an increase of 213 per cent over 1913. Attention was called to the fact that with gold used as a basis for circulation and accumulated in the vaults of large central banks in Europe and America, the amount of useful money would be increased and the value of gold as a commodity would decrease; consequently the cost of mining would grow much larger, so that the gold mining industry did not anticipate

a particularly prosperous condition in the future. During 1925 the imports of gold into the United States were much less than in 1913 and the exports were vastly greater than in that year. For 10 months in 1925 the imports of gold amounted to \$110,601,053, while the exports amounted to \$232,311,992. In 1924 for the corresponding period the imports were \$289,584,485, and the exports, \$15,284,478.

ing statement of the final estimate of refinery production of gold in the United States during the calendar year 1924. The figures for 1925 represent estimates from the Bureau of the Mint in coöperation with U. S. Bureau of Mines.

The 1924 gold production was the largest since 1919; it exceeded that of the prior year by \$543,000; the year of greatest production was 1915, when the value was \$101,035,700. The estimate for 1925 is slightly less. For tables of specie movement in foreign trade see FINANCIAL REVIEW.

**GOLD, TRANSMUTATION OF.** See CHEMISTRY, INDUSTRIAL; and PHYSICS.

**GOLD COAST.** A British colony in Africa, bounded by the French Ivory Coast on the west, the French Sudan on the north, Togoland on the east, and extending on the south for 334 miles along the Gulf of Guinea; comprising in addition to the colony proper, Ashanti and a protectorate. The area of the three divisions is estimated at 80,000 square miles; population according to the census of 1921, 2,078,043, of whom 2165 were Europeans. The capital and chief town of the colony is Accra, with a population of 38,000. Other large towns are Cape Coast Castle (15,000), Secondee (10,000), and Quittah (10,000). There were 20 government schools in 1922 and 213 aided schools under the various religious denominations. The enrollment of the primary and secondary schools was 33,353. There was besides a large number of unassisted primary schools supported by the religious denominations. The staple products and chief exports are: Cacao, palm oil, palm kernels, cola nuts, and India rubber; there has been also an increasing production of spice, coconuts, coffee, cotton, and a steady development of trade in the valuable native woods. The chief mineral is manganese, which constitutes an important export. The accompanying table from the *Statesman's Year Book* of 1925 gives statistics for three years:

	1921	1922	1923
Revenue * . . . . .	3,016,520	3,357,196	3,742,834
Expenditure * . . . .	3,285,290	2,934,994	4,105,619
Imports † . . . . .	7,661,324	7,900,539	8,448,862
Exports ‡ . . . . .	6,942,197	8,335,400	8,959,213

\* Financial year changed in 1921 to end on March 31, the figures above being for 1921-22, 1922-23, and 1923-24.

† Including bullion and specie.

‡ This includes 956,814L. expenditure on loan works which will be recovered from loan funds when the proposed new loan is raised.

The trade of the Gold Coast continued to increase during 1924, according to the report of the governor, and reached a total of 756,000 tons, or 118,000 tons more than in any previous year. New export records were established in cocoa products (223,000 tons), in manganese (233,000 tons), and cola nuts (17,000,000 pounds). The budget revenue for the year was reported as £3,667,000, or an excess over both recurrent and extraordinary expenditures of £337,000. The accumulated surplus balance of assets over liabilities amounted to £2,946,000, as compared with £792,000 in 1918. The shipping which entered and cleared in 1923 was 3,297,869 tons.

Ashanti, annexed by Great Britain in 1901, is under the Governor of the Gold Coast, although it has its own local laws and ordinances. Population, 1921, 407,000 (400 Europeans).

The chief town is Coomassie with a population of about 20,000. In 1922 the government schools at Coomassie had 540 pupils and there were 275 in government schools at two other towns, while the mission schools had some 6000 pupils. The forests in the western part are rich in mahogany, cedar, and other valuable woods, and in trees that yield rubber, oil and gum copal, and fruits. In the east the chief products are corn, bananas, peanuts, cocoa, etc. Local receipts in 1922-23 were £63,867; local expenditures, £236,201. The Northern Territories, constituted a British Protectorate in 1910, were also under the governor of the Gold Coast but locally administered by a chief commissioner. Tamale is the seat of government. Area, 31,000 square miles; population, (1921), 527,914, of whom only 49 were Europeans. The chief town is Navano with a population of 15,000. Local revenue in 1923-24, £8853; local expenditure, £87,736. Governor of the Gold Coast at the beginning of 1925, Brig-Gen. Sir F. G. Guggisberg; chief commissioner of Ashanti, J. Maxwell; chief commissioner of Northern Territories, L. Castellan.

**GOLF.** The only international golf competition of importance during 1925 centered about the play in the British open championship at Prestwick, Scotland. After the keenest sort of a battle James Barnes of the United States carried off the laurels, thus succeeding to the title won in 1924 by Walter Hagen, another American player. Macdonald Smith, also of the U. S. A., had a five-stroke lead in the 1925 event starting the final 18 holes but his game fell off so badly from this point that he finished in fourth place. Miss Glenna Collett of the United States essayed to capture the British women's championship only to be defeated in the second round of the tournament by Miss Joyce Wethered, the defending title holder.

Willie Macfarlane furnished the greatest upset of the year as far as play in the United States was concerned by triumphing over Robert T. Jones in the American open tournament held at Worcester, Mass. At the finish of the regulation seventy-two holes these two players were tied and the playing of an extra eighteen holes found them still deadlocked. It was not until after a second eighteen-hole struggle that Macfarlane emerged the victor by a margin of one stroke. Jones had better success in the amateur tournament, retaining his title after a spirited battle with Watts Gunns, who was competing in a championship test for the first time.

The United States intercollegiate title went to the Yale University team for the second consecutive year, although the individual honors were captured by G. F. Lamprecht of Tulane University. The team scores were: Yale, 1, 269; Princeton, 1, 280; Williams, 1, 281; Dartmouth, 1, 283; Harvard, 1, 295; Pennsylvania, 1, 325.

The winners in the more important tournaments of 1925 were: U. S. national open, Willie Macfarlane; U. S. national amateur, Robert T. Jones; U. S. national women's, Miss Glenna Collett; U. S. professional, Walter Hagen; British open, James Barnes; British amateur, Robert Harris; British women's, Miss Joyce Wethered; French open, Arnaud Massey; French amateur, M. Vagliano; French women's, Miss Glenna Collett; Canadian open, Leo Diegel; Canadian amateur, C. Carrick; Metropolitan

open, Gene Sarazen; Metropolitan amateur, Jesse Sweetser.

**GOODRICH, CASPAR FREDERICK.** American naval officer, died December 26, at Princeton, N. J. He was born at Philadelphia, Pa., Jan. 7, 1847, and graduated at the U. S. Naval Academy in 1864 at the head of his class. He served in the naval operations against the Confederacy on the U. S. S. *Macedonian* later in that year. After the close of the war he served on many of the vessels of the old wooden navy and made a special study of gunnery and later of torpedoes, which led to his appointment as special inspector of ordnance and subsequently as the head of the torpedo board. He attained the rank of Captain in 1897 and became president of the Naval War College at Newport for the term 1897-98, the War College having been established in part through his efforts in collaboration with Admiral Luce. In the war with Spain he commanded the cruisers *St. Louis* and *Newark* on an expedition to cut Spanish cables, and succeeded May 18 in cutting the cable from Santiago in Cuba to Jamaica, running within 2500 yards of the shore batteries and engaging them with small calibre guns. Somewhat later he directed the landing of 1600 men without lighters, on the south coast of Cuba, and in July he landed the troops of the Porto Rico expedition and later engaged in the bombardment of Manzanillo, Cuba. After the close of the war he again served at the War College and was successively Commandant of the League Island and Portsmouth Navy Yards. Attaining the rank of Rear Admiral in 1905, he commanded the Pacific Squadron. Receiving a wireless message of the San Francisco earthquake while at a distance, he reached San Francisco with his vessels in 48 hours and rendered important aid to General Funston in rescue measures. Admiral Goodrich was retired Jan. 7, 1909, but recalled to active service in the war with Germany, and placed in command of the Princeton University naval unit. He was president of the Naval History Society 1914-16, and for many years was president of the Naval Institute.

**GORDON BENNETT CUP COMPETITION.** See AERONAUTICS.

**GOUCHER COLLEGE.** A non-sectarian institution for the higher education of women at Baltimore, Md.; founded in 1885. For the year 1925-26 the fall enrollment was 1057 students, including 354 first year students, 282 second year, 211 third year, 208 fourth year, and 2 unclassified (alumnæ). The faculty, increased by nine additional members over the preceding year, totaled 100. The endowment funds of the institution amounted to \$1,853,321.68. The library contained 40,500 volumes. President, William Westley Guth, Ph.D., LL.D.

**GRAHAM'S LAND.** See FALKLAND ISLANDS.

**GRAIN.** See AGRICULTURE.

**GRAPES.** See HORTICULTURE.

**GRAPHITE.** In 1925 Madagascar was the leading producer of flake graphite and virtually dominated that field in the graphite industry. Ceylon supplied the crystalline lump variety used in the manufacture of graphite crucibles, and Mexico furnished the amorphous material used for lead pencils, while the cheaper amorphous grades employed for foundry facings, paint, and similar purposes, were derived from various local deposits. In the United States

in 1925 two companies were active in Alabama, one in Texas and a small amount of amorphous graphite was produced in Rhode Island, while it was proposed to work a graphite deposit near Allendale, N. J. Two Canadian companies were in operation and three American companies operated graphite mines in Sonora, Mexico, during the year. In 1924 the domestic natural graphite sold in the United States amounted to 4071 short tons of amorphous graphite, valued at \$38,533, and 1,800,325 pounds of crystalline graphite valued at \$48,977. In addition at Niagara Falls, N. Y., artificial graphite was manufactured in 1924 aggregating 10,986,192 tons. In 1924 there was imported for consumption 16,375 short tons of graphite, valued at \$399,511, and there were exported unmanufactured, 1022 short tons, valued at \$141,108, and manufactures of graphite valued at \$250,957.

**GRAVES, JOHN TEMPLE.** American author and editor, died at Washington, D. C., August 8. He was born at Willington Church, Abbeville County, S. C., Nov. 9, 1856, and studied at the University of Georgia. In 1881 he became editor of the *Daily Florida Union* of Jacksonville, Fla., serving for two years. He was with the *Atlanta (Ga.) Daily Journal*, 1887-88, and, 1888-90, with the *Tribune* of Rome, Ga. He was editor-in-chief and one of the proprietors, 1905-07, of the *Atlanta Daily Georgian*, and in the latter year became editor-in-chief of the *New York American*, serving until 1915 when he was made editorial representative of twelve daily Hearst newspapers. In 1884 he was presidential elector-at-large from Florida, and in 1888 from Georgia. In 1905 he was a candidate for the United States Senate from Georgia, but withdrew on account of his ill health. In 1908 he was the candidate of the National Independence Party for vice-president. He was esteemed as an orator, and spoke on many notable occasions. He advocated universal peace by arbitration and national preparedness. He wrote *History of Florida of To-Day*; *History of Colleton, S. C.*; *Twelve Standard Lectures*; *Platform of To-Day*; *Speeches and Selections for Schools*; and *The Negro*.

**GRAY, GEORGE.** American jurist and United States Senator, died August 7. He was born at New Castle, Del., May 4, 1840, graduated at Princeton in 1859, and studied law at Harvard. He was admitted to the bar in 1863, practicing at New Castle, Del., until 1869, thereafter at Wilmington. From 1879 to 1885 he was attorney-general of Delaware. He entered the United States Senate from Delaware in 1885 filling the unexpired term of Thomas F. Bayard, was reelected in 1887 and 1893, and in 1899 became United States circuit judge for the 3rd Judicial District. He was a delegate to the Democratic conventions of 1876, 1880, and 1884. In the presidential campaign of 1896 he joined the gold Democrats opposed to Mr. Bryan. He was a member of the American delegation sent to Paris by President McKinley to make peace with Spain in 1898, and also of the Joint High Commission at Quebec in the same year. In November, 1900, he was made a member of the International Permanent Court of Arbitration under the Hague Convention. In 1902 he was appointed by President Roosevelt chairman of the anthracite coal strike commission and was also appointed umpire in the United States-San Domingo Arbitration of 1903. He was a member

of the Tribunal of the North Atlantic Coast Fisheries Arbitration at The Hague, 1910, and May 17, 1915, was appointed peace commissioner to Great Britain. He was chairman of the United States delegation to the Pan-American Scientific Congress, and was appointed by President Wilson on the American-Mexican Commission of 1916. He was regent and chairman of the executive committee of the Smithsonian Institution, and a trustee and vice-president of the Carnegie Endowment for International Peace. Judge Gray was highly respected as a jurist and ranked as one of the ablest conservative Democratic statesmen.

**GREAT BRITAIN. UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.** A constitutional monarchy comprising the British islands. Capital, London. The term Great Britain, although literally it applies only to the island comprehending England, Scotland, and Wales, is often used as above to include Ireland, the Isle of Man, and the Channel Islands. Usage in this respect will probably undergo a change in view of the change in the status of Ireland (q.v.). The United Kingdom, and all its possessions and dependencies, that is to say the dominions, colonies, protectorates, and other territories subject to the ultimate control of the British Parliament, constitute the British Empire.

**AREA AND POPULATION.** The area of England, Scotland, Wales, the Isle of Man, and of the Channel Islands is 89,041 square miles; the area of Ireland, 32,586 square miles (see IRELAND, NORTHERN, and IRISH FREE STATE). The population of England, Scotland, and Wales in 1924 was 43,628,637. For the details of the census of 1921 see the 1923 and preceding YEAR BOOKS.

The accompanying table from the *Statesman's Year Book* of 1925 gives a comparison of the estimated population (exclusive of army, navy, and merchant seamen abroad):

Year (30 June)	England and Wales	Scotland	Total of Great Britain
1914.....	36,960,684	4,747,167	41,707,851
1921.....	37,885,242	4,882,288	42,767,530
1922.....	38,158,000	4,904,247	43,062,247
1923.....	38,498,000	4,901,100	43,399,100
1924.....	38,747,000	4,881,637	43,628,637

The provisional figures for the movement of population in England and Wales in 1924 were: Births, 730,286; deaths, 473,270; marriages, 296,024. Parallel figures for Scotland were: Births, 106,904; deaths, 70,359; marriages, 32,342. The total number of departures in the passenger traffic of British subjects in 1923 was 337,567, of whom about 256,000 went to places outside of Europe. According to the United States Bureau of Foreign and Domestic Commerce the British emigration problem involves two outstanding factors—the movement toward outlying portions of the British Empire and the permanent departure of a disproportionate number of skilled workmen. Upon the first depends, to a large extent, the growth of the British Empire and the strengthening of the intricate network on which British industry rests—the industrial and commercial interdependence between mother country and colonies. On the second hinges the commercial and manufacturing life of Great Britain. In the first case the numbers are too small, and in the latter too large. For the fifth winter the country was

facing heavy unemployment, and the Government was searching for methods of finding work for the army of unemployed, numbering about 1,300,000 and for eliminating unemployment doles. Emigration was hailed as a panacea for the economic ills of the country, but it likewise developed serious opposition from certain trades. In 1921 a conference was held with representatives of the Dominions, and as a result the "Empire Settlement Act" became a law on May 31, 1922. The act empowered the Secretary of State for the Colonies, on advice of the Overseas Settlement Committee, to cooperate with the Dominion Governments or with public authorities or public or private organizations, either in Great Britain or overseas, in carrying out approved schemes for the joint assistance of suitable persons in Great Britain who wish to settle overseas. Agreements were quickly entered into with the various Dominions, yet the number of persons who had actually emigrated with assistance under this act since its passage was relatively small in comparison to colonial needs. The accompanying table shows the total departures during 1924, as compared with all previous departures under the act:

**BRITISH EMIGRATION UNDER THE OVERSEAS SETTLEMENT ACT**

Destination under—	1922 and 1923	1924
Dominion schemes:		
Australia .....	81,067	24,214
New Zealand .....	6,839	7,786
Canada—		
Dominion of Canada .....	3,519	8,104
Province of Ontario .....	1,312	44
Minor schemes .....	1,624	1,481
Total .....	44,361	41,579

The plan was originally designed for the absorption of 50,000 persons per annum by Australia, 10,000 by New Zealand, 17,000 by Canada, and 18,000 by the minor schemes. The total number of British subjects, leaving permanent residence in the United Kingdom to take up permanent residence in non-European countries numbered 256,284 in 1923, a considerable increase from the total of 176,096 in 1922, but not equal to the total of 389,394 in 1913. The departures for permanent residence in the United States numbered 93,076. The United States was the leading destination for all classes except agriculture: of this class, 16,898 went to British North America. Of the 52,533 skilled workers departing in 1923, the United States received 28,827. Undoubtedly the increase would have been greater had it not been for the restrictions provided by the American immigration law.

Greater London remained the largest city in the world with a population in 1921 of 7,470,168 on the 443,449 acres covered by the Metropolitan and City Police Districts. Registration London, which coincides with the administrative county and nearly coincides with the area of the London parliamentary borough, had a population of 4,488,249 with an area of 74,850 acres. The estimated population of Greater London in 1923 was 7,616,229. Birmingham, the second city of England, had a population in 1921 of 919,438 (estimated, June, 1923, 946,400). Liverpool continued to stand third, with 803,118 (estimated, June, 1923, 837,600); and Manchester fourth with 730,551 (estimated, June, 1923, 752,100). Other large cities with

their populations are Sheffield, 490,724 (estimated, June, 1923, 524,200); Leeds, 458,320 (estimated June, 1923, 469,900); Bristol, 377,061 (estimated, June, 1923, 385,600). Glasgow continued to be the largest city in Scotland with a population of 1,034,174 (estimated, June, 1924, 1,051,000); Edinburgh, next with 420,264 (estimated, June, 1924, 427,500). The census of 1921 did not include Ireland. For the population of Australia, Canada, India, and other British possessions, see those titles.

**EDUCATION.** Elementary instruction is free and compulsory between the ages of 5 and 14. In 1923 the number of schools in England and Wales for elementary education was 21,391 with accommodations for approximately 7,150,000 pupils. The average attendance at these schools was 5,141,000 and the number of teachers, 166,000 in 1922. There are also numerous special schools for the blind and deaf and for mentally and physically defective children; poor schools; nursery schools, etc. In 1922-23 there were 118 training colleges for teachers in England and Wales with 18,504 students of whom 16,818 were training for elementary instruction. In 1922-23 there were in England and Wales 1264 recognized secondary schools with 364,000 full time students and 336 other secondary schools recognized by the Board of Education as efficient with 56,000 students. In Scotland the elementary schools which were in receipt of grants in 1923 numbered 2901 with accommodations for 875,000 pupils, with an average register of 676,000 for the year ending Aug. 31, 1923. In the same year there were 21,008 certificated teachers and 79 assistant teachers. In 1922-23 there were 148 grant-receiving secondary schools and 118 preparatory departments of secondary schools with a total accommodation for 106,800 students and an average register of 96,000.

The following table from the *Statesman's Year Book* of 1925 gives an estimate of the number of students and members of the teaching staffs in 1924-25 in the universities of Great Britain:

Universities	Number of professors, etc.	Number of students
<b>England:</b>		
Oxford .....	183 <sup>f</sup>	5,550 <sup>b</sup>
Cambridge .....	170	5,230 <sup>b</sup>
Durham (1831) .....	211	1,160 <sup>a</sup>
London (1836) .....	1,059 <sup>a</sup>	8,950 <sup>a</sup>
Manchester (1880) .....	250	2,250 <sup>a</sup>
Birmingham (1900) .....	243	1,580
Liverpool (1903) .....	864	1,980
Leeds (1904) .....	268	1,560
Sheffield (1908) .....	178	1,840 <sup>a</sup>
Bristol (1909) .....	231	3,150
Total for England ...	3,074	31,250
<b>Scotland:</b>		
St. Andrews (1411) .....	110	630
Glasgow (1450) .....	238	4,430
Aberdeen (1494) .....	125	1,350
Edinburgh (1582) .....	266	3,680
Total for Scotland ....	739	10,090
Wales (1908) .....	361	2,750
Totals of above .....	4,174	44,090

<sup>a</sup> Comprising 237 University Professors and Readers, and 822 "Recognized Teachers."

<sup>b</sup> Undergraduates.

<sup>c</sup> Internal students. In addition there are external students, i.e. matriculated students who have not taken a degree nor been registered as internal students. The number of these is not ascertainable but is probably greater than 9,000.

<sup>d</sup> Year 1921-22.

<sup>e</sup> Includes evening students.

<sup>f</sup> Including College Tutors.

Colleges exclusively for female students are: Bedford (62 teachers, etc., 601 students), Royal Holloway (33 teachers, 201 students), and Westfield Colleges (16 teachers, 121 students) in London; Newnham (15 teachers, 281 students) and Girton (11 teachers and 260 students) Colleges in Cambridge; Lady Margaret Hall (12 teachers and 113 students), Somerville College (11 teachers, 141 students), St. Hugh's College (9 tutors, 162 students), St. Hilda's College (10 teachers, 111 students) in Oxford.

**AGRICULTURE.** The following table from the *Statesman's Year Book* for 1925 shows the number and size of holdings in Great Britain. See also AGRICULTURE.

Size of Holdings, 1924	England and Wales	Scotland	Great Britain
1-5 acres .....	76,859	17,100	93,959
5-50 acres .....	191,471	33,445	224,916
50-300 acres .....	128,192	23,187	151,379
Over 300 acres .....	12,861	2,478	15,339
Total .....	409,383	76,210	485,593

The following tables show the distribution of the cultivated area and the livestock census for 1923 and 1924:

Cultivated area	England and Wales		Scotland	
	1923 Acres	1924 Acres	1923 Acres	1924 Acres
Corn crops <sup>a</sup> .....	5,611,812	5,502,852	1,197,572	1,188,771
Green crops <sup>b</sup> .....	2,213,320	2,183,646	579,282	573,965
Hops .....	24,893	25,897	.....	.....
Small fruit .....	63,698	73,515	6,937	6,969
Orchards ...	232,059	239,477	1,415	1,344
Bare fallow .....	435,592	355,599	7,355	6,992
Clover and mature grasses .....	2,600,263	2,547,687	1,505,581	1,515,075
Permanent pasture ...	14,762,124	14,948,124	1,426,296	1,442,174
Total .....	25,943,261	25,876,797	4,724,438	4,715,290

<sup>a</sup> Corn crops are wheat, barley or bere, oats, rye, beans, peas.

<sup>b</sup> Green crops are mainly potatoes, turnips and swedes, mangold, cabbage, kohlrabi, rape, vetches or tares.

Livestock	England and Wales		Scotland	
	June, 1923 Number	June, 1924 Number	1923 Number	1924 Number
Horses ..	1,281,279	1,232,198	203,833	193,696
Cattle ...	5,822,992	5,894,329	1,193,590	1,164,397
Sheep ....	13,835,533	14,843,195	6,785,723	6,886,152
Pigs ....	2,611,606	3,228,330	186,027	198,836

**MINERAL PRODUCTION.** The total value of all minerals produced in 1923 was £279,492,567 at the mines and quarries. The accompanying table from the source quoted above shows the iron ore produced in and imported into the United Kingdom, 1913 to 1924:

Year	Iron ore produced		Iron ore imported	
	Weight Tons	Value £	Weight Tons	Value £
1913	15,997,000	4,544,000	7,442,000	7,046,000
1919	12,254,000	7,428,000	5,201,000	11,271,000
1920	12,707,000	9,957,000	6,500,000	16,545,000
1921	3,471,000	2,208,000	1,888,000	3,738,000
1922 <sup>a</sup>	6,837,000	2,387,000	3,473,000	4,284,000
1923 <sup>a</sup>	10,875,000	3,555,000	5,861,000	6,850,000
1924	.....	.....	5,921,000	6,569,000

<sup>a</sup> Excluding production in Ireland in 1922 and 1923, and imports into the Irish Free State after 1st April, 1923.

In August the government granted a subsidy of £10,000,000 to the coal trade. Towards the close of the year this subsidy was increased to £19,000,000. See IRON AND STEEL and COAL.

The following table shows the coal raised and coal, coke, etc., exported from the United Kingdom from 1913 to 1924:

Year	Coal raised		Coal, coke, etc., exported	
	Tons	Value £	Tons	Value £
1913	287,480,000	145,536,000	76,688,000	53,660,000
1918	227,749,000	238,241,000	34,174,000	52,416,000
1919	229,780,000	314,113,000	38,467,000	92,298,000
1920	229,532,000	396,872,000	28,863,000	120,319,000
1921	163,251,000	213,746,000	26,247,000	46,370,000
1922	249,607,000	219,998,000	67,939,000	77,734,000
1923	276,001,000	259,734,000	84,497,000	109,947,000
1924	269,000,000	.....	65,532,000	78,313,000

**FISHERIES.** The following table shows the quantity and value of catch of British fish in 1923 and 1924:

	1923 Tons	1924 <sup>a</sup> Tons
England and Wales .....	575,707	684,429
Scotland .....	270,382	349,869
Great Britain (excluding shell-fish) .....	846,589	1,034,298
	£	£
England and Wales .....	13,871,992	15,151,737
Scotland .....	3,408,642	4,647,858
Great Britain (excluding shell-fish) .....	17,280,634	19,799,595
Value of shell-fish .....	527,734	550,370

<sup>a</sup> Provisional figures.

**LABOR SITUATION.** According to the United States Bureau of Foreign and Domestic Commerce, the labor situation did not improve during 1925 in spite of the optimistic opinions at the beginning of the year. At the end of August 12.5 per cent of the 11,500,000 insured against unemployment were unemployed, which stands against 10.6 per cent for the corresponding period of 1924. In other words, approximately 1,418,000 were out of work Sept. 1, 1925, as compared with 1,191,000 on Sept. 1, 1924. In-

£75,000 increases and £152,000 decreases. This is to be compared with reductions of £71,000 in the weekly wages of 725,000 workpeople and increases of £552,400 in the weekly wages of 2,600,000 during January-August, 1924. During the first eight months of 1925 wages of 190,000 were changed at various dates, but in the end were at the same level as at the beginning of the year. The principal wage increases occurred in the clothing industry, the transport industries, and the public utility services. The largest decreases were in mining and quarrying, and in the steel, transport, and textile industries.

The cost of living for September, 1925, according to the ministry of labor index of retail prices, was 74 per cent above July, 1914, and an increase of 2 per cent over September, 1924. The year 1925 began with the figure at 80 per cent and showed reductions through the first six months, reaching 72 per cent, and then advancing to the above figure. A considerable number of trade disputes were in progress during the year, but on the whole the position was slightly better than in 1924. From January to August there were 410 disputes, as compared with 484 during the same period of 1924, and involving 352,000 and 558,000 workpeople, respectively. The aggregate duration of these controversies was 5,661,000 days in 1925, as compared with 7,171,000 days in 1924. The figures for 1925 are exclusive of the seamen involved in the midsummer strike. The largest increase occurred in the textile industry. The disputes in the mining and quarrying industry were less in number, involved fewer people, but were of longer duration, thus increasing the number of working days. On the other hand, controversies in the building, decorating, and contracting trades showed improvement, and a change for the better was noticeable in the shipbuilding industry.

**COMMERCE.** The following tables on the commerce and trade of the British Empire were taken from the *Statesman's Year Book* of 1925:

**VALUE OF THE IMPORTS AND EXPORTS OF MERCHANDISE (EXCLUDING BULLION AND SPECIE AND FOREIGN MERCHANDISE TRANSHIPPED UNDER BOND) OF THE UNITED KINGDOM**

Year	Total imports £	Exports of		Total Exports £
		British produce £	Colonial produce £	
1913 .....	768,734,739	525,253,595	109,566,731	634,820,326
1918 .....	1,316,150,903	501,418,997	30,945,081	532,364,078
1919 .....	1,626,156,212	798,638,362	164,746,315	963,384,677
1920 .....	1,932,648,881	1,334,469,269	222,753,331	1,557,222,600
1921 .....	1,084,500,061	708,399,542	106,919,306	810,318,848
1922 .....	1,008,098,889	719,507,410	108,694,670	828,202,080
1923 <sup>a</sup> .....	1,096,226,214	767,257,771	118,543,805	885,801,576
1924 <sup>b</sup> .....	1,279,844,597	795,364,581	140,148,957	935,513,538

<sup>a</sup> From April 1, 1923, the figures relate to Great Britain and Northern Ireland, and include the trade between that area and the Irish Free State.

<sup>b</sup> Provisional figures.

creases in unemployment were noted in the coal-mining industry, iron mining, tin plate, and linen and wool textile industries. A slight improvement was noticeable in a few industries, including the building trades and some sections of the cotton and engineering trades. Wages in various industries fluctuated during the first eight months of 1925, but the net movement was downward, while in the previous year it was upward. The changes reported to the ministry of labor showed that 836,000 laborers received increases and that 960,000 suffered decreases, which resulted in a net change in weekly wages of

For the calendar year 1925 the value of imports into the United Kingdom reached £1,322,858,167 as compared with £1,277,439,144 in 1924. This advance of 3.5 per cent was to be accounted for by striking increases in three items, namely, an expansion of 200 per cent or the value of raw rubber imports from £8,276,967 in 1924 to £28,184,482 in 1925, (the quantity increase was 35 per cent from 14,675,700 pounds to 197,377,500 pounds); an increase in the value of non-ferrous metals and their manufactures from £32,717,394 in 1924 to £38,141,961 in 1925; third, an increase in automobile import

## IMPORTS AND EXPORTS FOR 1913 (UNITED KINGDOM) AND 1924 (GREAT BRITAIN AND NORTHERN IRELAND) (LATTER YEAR PROVISIONAL)

from £8,182,436 in 1924 to £11,260,848 in 1925.

The British exports in 1925 amounted to £773,086,410, showing a net increase in value of £27,880,427, or 2.9 per cent from the 1924 value of £880,966,837. Most of this decline was accounted for by a reduction in coal exports from £72,079,547 in 1924 to £50,477,211 in 1925. Other losses were in coke and manufactured fuel from £6,231,108 in 1924 to £3,836,626, in 1925, iron and steel and manufactures thereof from £74,534,129 to £68,162,243, and wool and worsted yarns and manufactures from £67,797,314 to £58,957,053.

**FINANCE.** The estimated revenue for the fiscal year beginning Apr. 1, 1925, and ending Mar. 31, 1926, was £801,000,000 and the estimated expenditure £799,000,000, according to the budget bill introduced into parliament on April 28 by the Chancellor of the Exchequer. It was expected to provide some encouragement to British business. It lessened the income tax burden, made available more money for home and overseas investment, increased the buying power of the middle classes, and by the contributory

health, old age, and widows' insurance, strengthened the workers' sense of security in industries. The following study of the first three months' operation of this budget was supplied by the United States Bureau of Foreign and Domestic Commerce. The general tendency of the British budget is for expenditures to be concentrated in the earlier part of the fiscal year, while the compensating receipts are delayed until the final quarter of the year. Receipts for the first quarter of the fiscal year 1925-26 were £169,187,110 and the expenditures, £220,458,878. This shows a decrease in receipts of £7,000,000 as compared with the same period in 1924-25 and of £16,000,000 in 1923-24. Expenditures, on the other hand, were £5,400,000 more in 1925-26 than in the preceding year and £6,000,000 higher than in 1923-24. One undesirable result of the increasingly uneven flow of receipts and expenditures is the effect on the money market. To secure funds to meet the current surplus of expenditures, the imperial treasury is forced to borrow large sums from the Bank of England, and these figure among the short-term items of the

floating debt. Such borrowings naturally restrict the volume of funds available for private credit demands. As the heavy Government borrowings are immediately followed by allocation of receipts to repayments of the bank loan, the situation is eased at intervals, with the result that the market is confronted with high and low peaks of credit offerings. In consequence the figure of the floating debt is also temporarily inflated at certain intervals. As these peaks occur at the middle and the end of the calendar year, they are commonly quoted in statistics, so that a distorted impression of the debt is conveyed.

**RAILWAYS.** The length of lines open at the end of 1923 was 20,294 miles.

**SHIPPING.** In 1924 the output of merchant shipbuilding was 1,440,000 gross tons. The tonnage of vessels entering British ports in 1924 with cargoes was 55,369,000 and the tonnage of vessels cleared was 65,248,000. The foreign tonnage entered amounted to 18,512,000 tons and was distributed as follows: United States, 2,747,000; Norway, 2,561,000; Netherlands, 2,424,000; Germany, 1,920,000; Sweden, 1,686,000; France, 1,636,000; Denmark, 1,489,000; Belgium, 979,000; Spain, 959,000; Japan, 458,000; Greece, 418,000; Italy, 403,000; Finland, 223,000; and Portugal, 99,000.

**ARMY AND NAVY.** The military system of the United Kingdom provides for a regular and territorial army and a reserve. Troops in the regular army serve both at home and abroad. Territorial troops serve only at home in peace times. The regular army in 1925-26 totaled 160,000 of whom 62,179 were in India and Aden. The establishment of the territorial army was 186,010 but the strength on Feb. 1, 1925, was only 139,602. See **MILITARY PROGRESS.**

The following table taken from the *Statesman's Year Book* of 1925 shows the number by classes of the more important units of the British fleet:

Class	Completed by end of		
	1923	1924	1925
Battleships and battle cruisers	22	22	22
Cruisers and light cruisers ..	48	48	52
Aircraft carriers .....	6	6	8
Fleet leaders and destroyers	205	207	207
Submarines .....	67	66	66

See also **NAVAL PROGRESS.**

**GOVERNMENT.** George V, born June 3, 1865, was the reigning monarch at the beginning of 1925. He succeeded his father, Edward VII, on May 6, 1910. The cabinet as organized in November, 1924, was constituted as follows: Prime Minister and First Lord of the Treasury, Stanley Baldwin; Foreign Affairs, J. Austen Chamberlain; Lord Privy Seal, Marquis of Salisbury; President of the Council, Marquis Curzon of Kedleston; Lord Chancellor, Viscount Cave; Chancellor of the Exchequer, Winston S. Churchill; Secretary of State for Home Affairs, Sir William Joynson-Hicks; Secretary of State for the Colonies, Leopold C. M. S. Amery; War, Sir L. Worthington-Evans; India, Earl of Birkenhead; Air Forces, Sir Samuel Hoare; First Lord of the Admiralty, W. C. Bridgeman; President of the Board of Trade, Sir Philip Cunliffe-Lister; Health, Arthur Neville Chamberlain; Agriculture and Fisheries, Edward F. L. Wood; Secretary for Scotland, Sir John Gilmour; President

of the Board of Education, Lord Eustace Percy; Minister of Labor, Sir Arthur Ramsay-Steel-Maitland; Chancellor of the Duchy of Lancaster, Viscount Cecil of Chelwood; Commissioner of Works, Viscount Peel; Attorney-General, Sir Douglas McGarel Hogg; Pensions, George C. Tryon; Minister of Transport, Wilfrid W. Ashley; Solicitor-General, Sir Thomas W. H. Inskip; Postmaster-General, Sir William Mitchell-Thomson; Lord Advocate, William Watson; Solicitor-General for Scotland, D. P. Fleming.

## HISTORY

**THE LIBERALS.** As noted in the preceding **YEAR BOOK**, the Labor and Liberal parties received a severe defeat in the elections held on October 29. As a result of that election the Conservatives were swept into power with a clear majority over all their opponents. The alignment was as follows: Conservatives, 419; Labor, 151; Liberals, 40; Independents, 5. The Liberal Party held its annual congress on January 29. The body voted to continue Herbert Asquith as the leader of the party, although he lost his seat at the last election and had since been raised to the peerage with the title of Earl Oxford and Asquith. Lloyd George, who remained the leader of the Liberals in the House of Commons, stated that he would unreservedly follow Earl Asquith.

**THE LABOR PARTY.** After the elections it appeared that there was going to be a cleavage in this party between the extremists and the Moderates. The radicals made several attacks on the throne, notably in the case of voting allowances for the visit of the Prince of Wales to South Africa and South America. Former Premier MacDonald supported the measure as did many of the moderate group. A fiery speech was made by John Wheatly, considered in many quarters as the successor to MacDonald as leader of the Labor forces, when, in connection with a debate on Communist propaganda, he stated that if the Conservative members "were entitled to advise the shooting of middle and upper class Germans because they could not accept their views, the Communists are equally entitled to advise the working classes to shoot down those who stand in the way of their prosperity." He stated that the purpose of the Conservative motion condemning Communism was "for the honorable members opposite, who keep millions of people in the gutter, to make it illegal for them to squeal. Revolutions are produced by such conditions. I tell you if I were enduring these conditions, or if I felt that tomorrow by exercising a little violence I could emancipate a million of my fellow-countrymen from perpetual poverty, I would feel in taking that course that I should be more justified than you were in the course you took in 1914." On another occasion the Labor members of the House left that body because of the suspension of one of their members who continually interrupted Austen Chamberlain in the course of an address.

The Labor Party warned foreign nations that if it ever came into power again it would not consider itself bound by any secret treaties that the present government might make. To clear up the impending break in the Labor ranks a committee was organized to investigate the situation and report on party discipline and unity. Another committee was appointed to advise ways and means for carrying out the decree of the

party that members of the Communist Party should not be allowed to join or affiliate with the Labor group. At Birmingham on March 4, Premier Baldwin made the following appeal to the workers and employers of Great Britain, apropos of the labor unrest throughout the country and the possibility of a general strike: "Human hands were given us to clasp, and not to be raised against one another in fratricidal strife. We are witnessing in England signs of an industrial storm gathering which, if it were to break, would spread misery far and wide and sweep back possibly for years all chance of returning and reviving prosperity. If the great trade unions of this country, such as the miners, transport workers, and railway men, unite on a policy of trying to enforce higher wages in their own trades by means of a strike, they may hold up many industries and do them irreparable harm. Suspicion must be removed. Organizations of employers and men, if they take off their coats to it, are far more able to work out solutions of their troubles than are the politicians."

**THE RETURN TO THE GOLD STANDARD.** On April 28, Chancellor of the Exchequer, Winston Churchill, announced that the British government was returning to the gold standard and that the fluctuations in the British pound would thus cease. Australia and New Zealand adopted a similar course immediately, and South Africa was prepared to do the same by July 1. Inasmuch as Canada was already on a gold standard, virtually the entire British Empire returned to the pre-war status of the currency. In this connection, the Chancellor said, "Thus over the whole area of the British Empire and over a very wide and important area of the world there has been established at once one uniform standard of value, to which all international transactions are related and can be referred. I believe that the establishment of this great area of common arrangement will facilitate the revival of international trade and interimperial trade. I believe that such revival and such foundations are important to all countries, and to no country is it more important than to this island, whose population is larger than its agriculture or its industry can sustain, which is the centre of a wide empire, and which, in spite of all its burdens, has still retained, if not the primary, at any rate the central position in the financial system of the world." In order to bring about this change the Chancellor had arranged for credits of \$200,000,000 with the Federal Reserve Bank in New York and for \$100,000,000 with the Morgan firm, and had accumulated a gold reserve of £153,000,000.

**THREATENED COAL STRIKE.** In the summer the difficulties between the coal miners and operators had reached the breaking point. The operators requested that the miners lengthen their working day from seven to eight hours and that they accept a cut in wages. This the Executive Committee of the Miners' Federation refused to do and renewed their efforts to form an industrial alliance combining all the basic industries of Great Britain. On the last day of June the operators announced that the wage scale terminating July 31 would not be renewed. In the face of the threatened catastrophe the Prime Minister appointed W. C. Bridgeman, the First Lord of the Admiralty, as a mediator between the two groups. Two or three weeks of useless

bickering followed. On the last day of July the government avoided the strike, which was threatened to be called on the next day, by announcing that the government would subsidize the coal industry to the extent of £10,000,000. As noted above this was subsequently increased to £19,000,000. The miners were guaranteed their present wage scale until May, 1926, and the operators were to be reimbursed for any deficiencies that might ensue because of the continuance of the wage scale. Baldwin's action was criticized by practically every newspaper and political leader throughout the country. His only reply was that he either had to do that or face the economic consequences of a huge strike. The radicals stated that it was merely a truce and that the miners should use the interim to strengthen their position for the deadly struggle that was bound to occur when the government's subsidy ended. The operators took about the same viewpoint. In some quarters the situation was blamed upon the return of the gold standard but this was vigorously denied by Winston Churchill.

**CONFERENCE OF BRITISH LABOR PARTY.** The British Labor Party held a conference from September 29 until October 2, and reasserted in no uncertain tones that it would have nothing at all to do with communism in any form. By a vote of 2,954,000 to 321,000 the conference rejected a proposal to reconsider the 1924 decision of the party against affiliation with the Communist Party. The conference went on record as being almost unanimously in favor of the stamping out of communism in the trade unions, even going so far as to deny individual communists the right to join any trade union affiliated with the party. The conduct of the foreign office during the premiership of Ramsay MacDonald was heartily endorsed and a national development board was advocated to relieve unemployment. The conference which was attended by 1000 delegates represented 3,200,000 members of the Labor Party. The trend among the members seemed to be in favor of the moderate wing of the party led by MacDonald and J. H. Thomas, rather than the extremist wing led by Wheatly.

**TRIAL OF THE COMMUNISTS.** An outstanding feature of the year was the attempt on the part of the government to suppress communistic utterances and acts. The culmination was the trial of twelve communists on the charges of incitement to sedition and other similar crimes. The twelve were found guilty and seven were sentenced on November 25 to six months' imprisonment and five to one year's imprisonment. On December 1, the House of Commons rejected a resolution censuring the government for the prosecution of the communists. Ramsay MacDonald, the chief supporter of the resolution, stated that he was not in favor of the resolution but was in favor of liberty of opinion. He stated that the trial was unfairly conducted and partook more of the political meeting than a judicial proceeding.

**LOCARNO TREATIES.** On November 19 by a vote of 375 to 13 the House of Commons voted to approve the Locarno pact. The Liberals and Laborites supported the government, the only opposition coming from the radical members of the Labor Party, one Liberal, and one Communist. For a discussion of this pact see LOCARNO CONFERENCE AND TREATIES.

For an account of the death of Queen Alexandra consult her biography, which is given under its own title.

**GRECIAN ARCHÆOLOGY.** See **ARCHÆOLOGY.**

**GREECE.** A republic in southeastern Europe, comprising the lower Balkan peninsula and many islands in the Ægean Sea; formerly a constitutional monarchy. King George II was forced to leave Greece, Dec. 19, 1923; the republic was established as a result of a plebiscite, Apr. 13, 1924 (758,742 votes were for a republic and 325,322 against). In continental Greece are included Macedonia, Western Thrace, and Epirus; the chief of the island possessions is Crete. Capital, Athens.

**AREA AND POPULATION.** The total area of Old Greece before the Balkan Wars of 1912-13 was 25,223 square miles; as a result of these wars Greece added 20,617 square miles to her territory. According to the Treaty of Lausanne (1923) Greece obtained a further area of 3182 square miles; the total area of the present Greek republic is 49,022 square miles. The population at the census of 1920 was 5,536,375. The three cities with a population of more than 100,000 in 1920 were Athens, 292,091, Saloniki, 170,321, and Piræus, 133,482. Up to the time the United

mineral products. Many hill slopes are utilized for olive groves, and some parts of Greece have orange terraces that equal those of Sorrento and Amalfi in southern Italy. Moreover, its currant crop is the most important in the world, and it has between 700,000 and 800,000 acres planted in tobacco.

But the grain grown on the plains of Thessaly and Macedonia has never met the needs of the population of 5,000,000, even before the large addition of refugees and exchanged populations from Asia Minor. In spite of the great value of the tobacco and currant crops, Greece's imports of grains (by far the largest import item) and coal have resulted in a constantly unfavorable balance of trade, and this already serious problem was aggravated by the increase of 20 per cent in the country's population within a period of only a few months. The increasing cereal imports as shown in the following table were a chief contributing cause of the large excess of imports over exports, and, until the floating of the refugee loan, the feeding of an additional million and a quarter people threatened the country with serious financial difficulties. Refugee settlement and enlarged grain production through an increase in arable land is therefore still the essential problem in Greece to-day.

RELATIVE IMPORTANCE OF GRAIN IMPORTS IN GREECE'S UNFAVORABLE TRADE BALANCE

	[In thousands of dollars]				
	1914	1921	1922	1923	1924
Imports:					
Total .....	34,475	100,879	102,003	103,452	142,586

States adopted the quota plan of immigration, considerable numbers of Greeks emigrated to that country annually (31,828 in 1920-21).

**EDUCATION.** Education is compulsory for all children between the ages of 7 and 12. In 1922 there were 7200 primary schools with 13,996 teachers and 499,084 pupils. In 1923 there were for secondary education 122 high schools, with 88,250 pupils. There are two universities at Athens; the National University and the Capodistria University, with 61 professors and 9799 students. There are also various technical schools, and in 1922 there were 22 commercial schools with 3826 pupils.

**PRODUCTION.** The following account of the agricultural situation in Greece was supplied by the United States Bureau of Foreign and Domestic Commerce: The award to an American company of the \$27,000,000 contract for drainage and irrigation of the Saloniki plain is an important event in the modern economic history of Greece, perhaps second only in importance to the great refugee influx of 1922-23. One of the great economic problems of Greece has always been the vital one of self-support in food supply. Only about one-fifth of its 50,000 square miles is cultivable, and fully three-fifths consists of barren, almost treeless hills and mountains—more valuable as a scenic attraction to tourists than as a source of agricultural or even

It is scarcely an exaggeration to say that the solution of this problem of housing Greece's refugees, feeding her augmented population, balancing her foreign trade, and so restoring her economic stability lies in the drainage and reclamation of the Saloniki plain. The completion of the project will therefore mark an era in the economic, and perhaps also in the political history of the country. The "Vardar concession" as the Saloniki drainage project is frequently called, involves the drainage and irrigation of the Saloniki plain, approximately 800 square miles in extent, lying west of the city of Saloniki and formed by the alluvial deposits brought down by the rivers Galikos, Vardar, Loudias, and Vestritza, which now traverse it from the mountains to the bay. By the flooding of these rivers, chiefly the Vardar, villages are frequently wiped out and crops ruined, and life is made so insecure and unsatisfactory on the plain that only a small part of it is cultivated. Moreover, approximately 300 square miles consist entirely of swamps and great shallow lakes that are wholly uncultivable. It is the reclamation of the whole Saloniki plain that is contemplated in the present project.

The 1923 output of the principal minerals in tons was as follows: Chromite, 14,820; emery, 21,626; iron, 100,115; iron pyrites, 52,290; lead, 53,566; magnesite, 62,552; zinc, 4026; and salt,

59,908. The principal industries are metal products, machinery, building, textile products, food, chemical products, leather, paper, printing, wood-carving, and cigarette and hat manufacturing. Carpet making, a specialty of Greeks from Asia Minor, is becoming important.

COMMERCE. The proposed establishment of a protective tariff, originally set for Mar. 1, 1925, resulted in unusually heavy imports, and

refugees. Meanwhile under the control of the Interallied Finance Commission the Greek government has met its current obligations incurred through foreign loans and has made no further issues of paper money since 1923. The accompanying table of revenues and expenditures which is taken from the *Statesman's Year Book* of 1925 gives the particulars of the budget for the fiscal year 1924-1925.

when the enforcement of this tariff was postponed nine months, Greek merchants found themselves with considerable stocks on hand, and large obligations outstanding. In order to meet these obligations, large quantities of goods were dumped on the market, which condition, with the prevalent tight money market and shortage of foreign exchange, resulted in numerous bankruptcies and suspensions. The accompanying table from the *Statesman's Year Book* for 1925 shows the distribution of the foreign trade by commodities for 1922 and 1923.

COMMUNICATIONS. The merchant marine of Greece on June 30, 1924, consisted of 1058 sailing vessels of 121,934 tons and 442 steamers of 779,514 tons. In 1923, 18,197 vessels of 9,313,521 tons entered the ports of Greece. The length of the railways in 1923 was about 1700 miles, of which 75 per cent was standard gauge.

FINANCE. With regard to the public debt of Greece, *Commerce Reports* stated that the two Balkan Wars, the World War, and a disastrous campaign in Asia Minor—12 years of almost continuous conflict—had already laid a heavy burden on the finances of Greece, when there was added to it the strain of caring for more than a million refugees from Asia Minor, most of them destitute. To meet the enormously heavy expenditures incurred by these conditions the Greek government felt itself obliged to increase its financial obligations by huge internal borrowings that continued through May, 1923. These obligations, added to foreign loans most of which were acquired before 1915, had resulted by the end of 1923 in a per capita debt of \$78 on a population whose buying power is very low. The situation was somewhat relieved, however, by the fact that a number of these refugees were skilled textile workers whose output has added to the export resources of the country; the strain has been further mitigated by the recent £10,000,000 loan for the permanent habilitation of the

GOVERNMENT. Until December, 1923, executive power was vested in the king, acting through a responsible ministry. On Dec. 18, 1923, George

II, who had reigned since Sept. 27, 1922, was compelled to leave Greece until the people had an opportunity to decide for themselves whether they wanted a monarchy or a republic. In the meantime Admiral Koundouriotis acted as provisional president. As noted above the people voted strongly in favor of a republic. The ministry as constituted on Oct. 7, 1924 was as follows: Premier and Minister of Foreign Affairs, A. Michalakopoulos; Marine, A. Miaoulis; Interior, Gen. G. Kondylis; National Economy and Education, M. Manettas; Agriculture and Communications, G. Maris; Social Insurance, Dr. Missirloglou; Justice, P. Chitsekis; Finance, C. Gotsis; War, General Gondikas. For changes in the cabinet and discussion of the constitution see below.

**HISTORY.** The mixed commission appointed by the League of Nations to take care of the interchange of Greek and Turkish citizens reported in the last week in January that the work was almost completed. Up to that time 36,625 Greeks who had arrived in Constantinople after Oct. 31, 1918, were repatriated. Considerable indignation was expressed throughout Greece by the expulsion of Dr. Constantinos, the Ecumenical Patriarch of the Greek Catholic Church, by the Turkish authorities.

Premier Michalakopoulos stated at the beginning of the year: "We must hasten the ratification of the new charter. This is what the healthy opinion of the country unanimously demands. But even from an international point of view we cannot inspire that confidence which we need so greatly, so long as we do not return to normal political life through free elections. In order to accomplish this the good-will of the members of the National Assembly and their coöperation are absolutely necessary. The speedy termination of the labors of this National Assembly is therefore of the utmost national importance." Despite this urging on the part of the premier the work of drafting a constitution lagged, practically the entire year. On June 11, the Michalakopoulos government fell. This action came as a great surprise because the coalition ministry under his leadership had really accomplished much in the way of putting the new republic on its feet. He and his fellow members had successfully weathered a general strike and had remained calm under the storm of anger against Turkey for the expulsion of the Patriarch. Admiral Konduriotis, the Greek president, requested M. Kaphandaris, the leader of the Progressive Liberals, to form a cabinet, but upon his inability to do so Michalakopoulos formed a new group to carry on the government. On June 25, however, a military and naval coup d'état under the leadership of General Pangalos and Admiral Hadjikiakos succeeded in turning out the ministry under threat of bombarding the government buildings. General Pangalos took charge of the new government himself and virtually made himself a dictator. He had always been opposed to Michalakopoulos because of the latter's charge that it was the machinations of army officers that caused the embarrassment of his government.

On September 30 General Pangalos's government issued a decree which dissolved the National Assembly, which had acted both as a legislative body and a constitutional convention. New elections were ordered. General Pangalos gave as the reason for his act the fact that the

Assembly had lost the confidence of the people and that the body was an obstacle in the way of complete harmony among the political factions of the country. The new elections were to be held in February or March, 1926, according to an announcement of General Pangalos on October 19. For a discussion of the difficulties with Bulgaria see the historical section of the article on that country and the article on the League of Nations.

**GREEK ARCHÆOLOGY.** See ARCHÆOLOGY.

**GREENE, GEORGE WELLINGTON.** Judge of the Rhode Island Supreme Court, died January 28. He was born at Hespeler, Ontario, Nov. 26, 1866, and after education in public schools was graduated LL.B. at Boston University in 1889. He entered the practice of law at Woonsocket, R. I. In 1896 he was Mayor of Woonsocket and again held that office from 1899 to 1902. He ran as a democrat for Secretary of State of Rhode Island in 1894 and for Governor in 1899, and held important party offices in the State, including that of chairman of the Democratic State Committee, 1898 to 1902. He was a delegate to the Democratic National Conventions 1896 to 1916.

**GREENLAND.** The only colonial possession of Denmark. It is the largest island in the world next to the island continent of Australia. The area is variously estimated from 826,000 to 849,000 square miles. The settled portion, the only part included in Denmark's colony, has an area of 46,740 square miles with a population, according to the census of 1921, of 14,355, of whom 274 were Danes. The largest settlement is Sydproven, with a population of 901, and the smallest, Skansen, with a population of 49. The interior remains unknown in detail, but the main geographical features are generally understood. Nearly the whole country consists of a plateau from 2000 to 3000 meters above the level of the sea, which means that it is covered by a thick, permanent coat of snow and ice, only about one-twenty-fifth of the surface being free from it and suited to cultivation. Most of the inhabitants are located on the coast or on adjacent islands.

In 1922 the exports to Denmark were valued at 2,283,000 kroner and the imports from Denmark at 1,798,000 kroner. The trade, chiefly in seals, sealskins, fox skins, fish, and oil, is a monopoly of the Danish government. At the head of the government is a director who resides in Copenhagen.

The interesting report of Wulff, of the 2d Thule expedition, shows the discovery in extreme northern Greenland, between 81° and 84° north latitude, of 10 species of flowering plants, there being 70 perennial herbs and dwarf shrubs. The claim of Denmark to the complete sovereignty of Greenland reached a practical solution. In the treaty for the cession of the Virgin Islands to the United States, Denmark was assured that there would be no objection "to the Danish government extending their political and economic interests to the whole of Greenland." When approached, Norway objected, asserting her ancient rights to hunting and fishing on the east coast. Eventually the general question was adjusted by treaty, July 9, 1924, between Norway and Denmark, by which the former nation retains certain rights on the east coast from Lindenow Fiord, 60° 27' to 81° N. latitude, ex-

cepting however the district of Angmagssalik.

**GUENADA**, grē-nā'dā. A British insular possession in the Windward group of the West Indies. Area, 133 square miles; population, according to the census of 1921, 66,302; estimated, December, 1923, 68,086. Grenada includes half of the Grenadine Islands, the other half being administered from St. Vincent. The capital is St. George's, with a population in 1924 of about 5000. In 1923 the movement of population was: Births, 2627; deaths, 1135. There were 56 government and government-aided schools in 1923 with 10,671 pupils. The chief products which were also the chief exports were: Cacao, spices, lime juice, cotton and cotton seed. Lately there has been an increased manufacture of sugar, and, in 1923, 31,768 proof gallons of rum were produced locally. In 1923 the revenue was £103,823 and the expenditure, £113,472. In 1923 the total value of imports was £285,063 (from United States £39,076); total value of exports £257,728 (to United States, £77,602). The total shipping which entered in 1923 was 371,544 tons (nearly all British). The colony is under the governor of the Windward Island group, but has its own institutions. Governor and commander-in-chief of the Windward Islands including Grenada, at the beginning of the year, Sir Frederic Seton James; Colonial Secretary for Grenada, H. Ferguson.

**GUENFELL**, FIELD-MARSHAL LORD FRANCIS WALLACE. British soldier, died January 27. He was born Apr. 29, 1841, and his first commission was purchased in August, 1859, in the 60th Foot which later became the King's Royal Rifle Corps. Until 1875 his military career was uneventful. Service in such minor campaigns as the Kaffir War of 1878 and the Zulu War of 1879 followed until 1881. Joining the Egyptian expedition of 1882 he took a prominent part in the campaigns that followed. He was in the Nile expedition of 1884, and during the Gordon relief expedition of 1884-85 controlled the lines of communication. When the forces of the Mahdi threatened the whole of Egypt Grenfell was appointed Sirdar of the Egyptian Army which he reorganized. He was chief staff officer under Sir F. Stephenson of the expedition which routed the Dervishes at Ginniss, 1885. He himself as commander in Egypt defeated the Dervishes in 1889 and put an end to threats of a Mahdist invasion. The seven battalions of the Egyptian army which he took over in 1885 he expanded from a discouraged force to a powerful army of 14,000 men with a record of victory. In 1892 General Grenfell left Egypt and in 1894 acted as a deputy adjutant-general for the Yeomanry in London. For three years he was Adjutant-General of the Forces. In 1897, dispatched once more to Egypt, he participated under Kitchener in the successful campaign for the reconquest of the Sudan. Grenfell remained at Cairo sending forward forces to aid the Egyptian Army and to participate in the victories at Atbara and Omdurman. In 1899 Grenfell was appointed Governor and Commander-in-Chief in Malta, remaining throughout the South African War. In 1902 he entered the peerage as Baron Kilvey. On his return to England in 1903 he assumed command of the Fourth Army Corps and in the following year took over the chief command in Ireland which he held for four years. In 1908 he was promoted Field-Marshal, and retired to private life. He received

the honorary degree of LL.D. from Cambridge and Edinburgh, and was colonel of the First Life Guards and the King's Royal Rifles.

**GRIFFIN**, SOLOMON BUCKLEY. American editor, died at Springfield, Mass., December 11. He was born at Williamstown, Mass., Aug. 13, 1852. Educated at Williams College; in 1872 he joined the staff of the *Springfield Republican*. His connection with this newspaper of which he became managing editor in 1878 continued for the rest of his life. He was president of the Hampshire Paper Company, vice-president of the Carew Manufacturing Company, and alumni trustee of Williams College, 1910-20, and a permanent trustee from 1920 until his death. He also was on the advisory board of the Pulitzer School of Journalism. He held degrees of A.M. and L.H.D. from Williams; and LL.D. from Amherst. Among his works were *Mexico of To-day* (1886); *People and Politics Observed by a Massachusetts Editor* (1923).

**GUADELOUPE**, ga'de-loop'. A French insular possession in the Lesser Antilles in the West Indies, consisting of two islands separated by a narrow channel, the one on the west being Guadeloupe proper or Basse-Terre, and the one on the east Grande-Terre. Combined area, 532 square miles; total area, including five small dependent islands, 688 square miles. In 1922 the population was 229,839. The capital is Basse-Terre, with a population of 8318; chief town, Pointe-à-Pitre, with 27,679 inhabitants. The public elementary schools (1923-24) include 117 teachers and 13,800 pupils. For higher education there is a *lycée* with 489 pupils. The chief products for export are: Cacao, coffee, sugar, and rum. For local consumption, bananas, sweet potatoes, tobacco, Indian corn, manioc, and vegetables are produced. In 1923 the imports were 86,413,872 francs and the exports, 104,911,764 francs. The revenue and expenditures for 1924 balanced at 18,275,008 francs. The outstanding debt on Dec. 31, 1923, was 756,804 francs. There is communication with France by means of two steamship companies, and there is a wireless station at Des-trellan. At the head of the government are a governor and an elected council, and the colony sends to the French parliament one senator and two deputies.

**GUAM**, gwām. An insular possession of the United States, situated at the southern end of the Marianne or Mariana Islands, of which it is the largest and most populous, in the Pacific Ocean at a distance of about 1500 miles from Manila and 5053 from San Francisco. Area, about 225 square miles; population, exclusive of the military and naval establishments, 15,710 on June 30, 1924, of whom 15,160 were classed as natives. Capital, Agaña, with about 8500 inhabitants. In 1924 the school registration was 2833 pupils. Spanish and English are spoken in addition to the native Chamorro. The products of the island include cacao, coffee, copra, corn, rice, sugar, sweet potatoes, and timber. The imports in 1924 amounted to \$853,384; the exports from the island, \$113,754. The island constitutes an American naval station, of which its governor, appointed by the President, is commander; also military commander of the island. Governor at the beginning of 1925, Capt. H. B. Price, U. S. N.

**GUATEMALA**, ga'te-mā'lā. A Central American republic lying between the Caribbean Sea

and the Pacific Ocean and south and southeast of Mexico. Capital, Guatemala City.

**AREA AND POPULATION.** Area, estimated at 48,290 square miles, but the limits have been uncertain on account of boundary disputes and the area has been figured as low as 42,353 square miles. Population, according to the census of 1920, 2,004,900, of whom about 60 per cent are pure Indians, most of the rest being mixed breeds. Guatemala City had a population of 115,938, according to the census of 1921, having regained in recent years the losses resulting from the series of earthquakes in 1917-18. Other important towns are: Quezaltenango, 30,125; Coban, 26,774; and Totonicapan, 29,970.

**EDUCATION.** Education is free and compulsory between the ages of 6 and 14. During the school year 1923-24 there were 2798 government schools, including 1081 public schools for boys, 1388 for girls; 115 private schools for boys and 214 private schools for girls. There were 89,484 pupils enrolled in the school year 1923-24. In addition to the National University, which includes schools of law, political and social science, medicine and surgery, natural sciences and pharmacy, and engineering, there were also: Popular University (founded in 1924), the National Institute for Boys; the Institute and Central Normal School for Girls; Central Normal School for Boys; Normal School for Indians; National School of Commerce for Boys; National School of Commerce for Girls; National Conservatory of Music; School of Fine Arts; Institute and Normal School for Boys of Occidente, etc.

**PRODUCTION.** The chief occupation is agriculture, and coffee is the staple crop. Other important crops are sugar, bananas, corn, beans, wheat, rice, tobacco, and potatoes. No later statistics on acreage and yield are available than those given in the preceding YEAR BOOK. Mahogany and dye woods are exported to the United States. Silver, gold, iron, lead, and copper mines exist, but are of little commercial value because of inadequate means of transport.

**COMMERCE.** The following account was supplied by the United States Bureau of Foreign and Domestic Commerce: The year 1924 marked the period of highest total value of trade for Guatemala, surpassing even the boom year of 1920 by \$6,281,168, an increase due in its entirety to increased exports, according to official statistics. Imports for 1924, however, were but \$73,206 smaller than those of 1920, which when considered in the corresponding price deflation, were actually larger than those of 1920. Imports and exports in United States dollars, for the period 1920-24, inclusive, with the percentage obtained by the United States, follow:

#### FOREIGN TRADE OF GUATEMALA AND SHARE OF UNITED STATES

Year	Imports from United States	Percentage to United States	Exports to United States	Percentage to United States
1920.....	\$18,844,463	64	\$18,102,906	83.04
1921.....	18,616,438	61	12,180,890	66.50
1922.....	10,751,660	62	11,640,415	67
1923.....	18,768,499	60	14,725,581	75
1924.....	18,271,258	63.2	24,457,280	50.41

Germany supplied some 20.8 per cent of Guatemala's importations in 1913. This trade was practically destroyed during the war, but has since been restored, at least in part. Great Brit-

ain is virtually holding its own in the import trade of Guatemala, and France has registered a slight gain. In the export trade of the country, however, Germany has registered a decided comeback since the close of the war and is now second to the United States. Principal items of export of Guatemala are coffee, sugar, bananas, woods, chicle, hides, skins, and honey. Imports as a whole are manufactured goods. The principal items of importation are shown in the following table for 1923 and 1924, in American dollars:

Commodity	1923	1924
Cotton textiles .....	\$2,668,448	\$4,212,377
Iron and steel products .....	1,178,592	580,791
Leather goods .....	123,523	181,018
Food products .....	373,092	814,686
Drugs and chemicals .....	300,390	384,966
Wheat flour .....	817,937	777,188
Agricultural and industrial machinery .....	560,551	598,896
Railroad equipment .....	515,305	810,019
Crude and refined petroleum .....	151,855	270,637
Wines and liqueurs .....	366,323	392,423

**FINANCE.** The United States Bureau of Foreign and Domestic Commerce reported the revenues of the Republic of Guatemala in 1924 as \$8,101,682. This amount compared with \$6,360,215 (385,874,260 pesos) for the year 1923 based on the average exchange rate for that year of 60.67 pesos for \$1. The revenues for 1924 in detail were as follows:

	Per cent
Import duties .....	\$3,841,336
Export duties .....	1,486,437
Tax on liquors .....	1,658,831
Miscellaneous taxes .....	764,096
Post-office receipts .....	291,549
Telegraph .....	177,056
Consular fees .....	100,530
Miscellaneous .....	331,847
	\$8,101,682

The expenditures for 1924 amounted to \$8,095,563 as compared with \$6,529,106 (396,121,975 pesos) in 1923. The excess of revenues over expenditures in 1924 amounted to \$6122 as compared to a deficit of \$168,880 in 1923. The more important items of government expenditure for 1924 were as follows:

	Per cent
Department of Government and Justice .....	\$1,328,970
Department of Finance and Public Credit .....	9.50
Department of Public Works .....	9.00
War Department .....	21.00
Public education .....	11.75
Department of Agriculture .....	8.80
Foreign relations .....	1.60
Public debt .....	11.25
Los Altos Railway .....	8.30
Miscellaneous expenditures ..	2.80

On May 21, 1925, the Legislative Assembly passed the budget law for 1926, which estimates government expenditures for that year in pesos as follows: Government and Justice, 72,145,140; Treasury and Public Credit, 97,903,883; Promotion, 82,529,800; War, 72,181,216; Education, 83,518,034; Agriculture, 28,386,400; Foreign Relations 13,865,145; total, 450,529,618. As the total revenues were calculated at 450,810,000 pesos, there was an estimated surplus of 280,380 pesos.

COMMUNICATIONS. See the preceding YEAR BOOK for the latest information on entrances and clearances at the ports of the republic. The total mileage of track in Guatemala by the International Railways of Central America is approximately 440, exclusive of 55 miles of sidings.

GOVERNMENT. The executive power is vested in a president elected for six years and legislative power in a national assembly, consisting of representatives elected for four years and a council of state, consisting of 13 members, part of whom are elected by the national assembly and part appointed by the president. President at the beginning of 1925, Gen. José María Orellana (March, 1922, to March, 1928).

HISTORY. In April Centenary Hall, the meeting place of the National Assembly, was destroyed by fire and resulted in the suspension of the legislative meetings until a new meeting place could be found. The original copy of the Guatemalan Declaration of Independence was lost in the conflagration.

GUGGENHEIM FOUNDATION. See UNIVERSITIES AND COLLEGES.

GUIZERAS, JUAN. Cuban physician and sanitarian, died suddenly, October 28, at Matanzas, Cuba. He was born at Matanzas, Jan. 4, 1852, and after receiving his early schooling there, studied medicine at the University of Pennsylvania, graduating in 1873. From 1873-79 he was resident and visiting physician to the Philadelphia Hospital and in 1879 became a member of the staff of the United States Marine Hospital Service, serving until 1889. He was professor of medicine at Charleston Medical School, 1884-88, and of pathology at the University of Pennsylvania, 1889-99. In the Marine Hospital Service he served as expert in yellow fever in many epidemics. During the Spanish-American War he accompanied General Shafter as yellow fever expert. In 1900 he became professor of general pathology and tropical diseases in the University of Havana. With Gen. William C. Gorgas and others he engaged in stamping out yellow fever in Cuba and in forwarding sanitation. He also shared in the final demonstration of yellow fever transmission by the mosquito. He was director of public health of Cuba, 1909-21, president of the National Board of Health in 1921, and secretary of Public Health and Charities, 1921-22. He was director of Las Animas Hospital, editor of *La Revista de Medicina Tropical*, and president of the 2nd National Medical Congress of Cuba. He was also a member of the Yellow Fever Commission of International Health Board of the Rockefeller Foundation, from 1916. He made the discovery of filaria Bancrofti in the United States, and of uncinaria in Cuba. Much of the improved health record of Cuba was due to his work.

GUITYRY, (gī'trē'), LUCIEN. French actor, died June 1. He was born at Paris in 1860, and made his first appearance at the Gymnase in 1878 as Armand in *La Dame aux Camélias*. For nine years he was at the Théâtre Michel in St. Petersburg, and returning to Paris became manager of the Porte St. Martin where he produced Zola's *L'Assommoir* during the Dreyfus affair. For seven years afterwards he was actor-manager of the Renaissance where he played various parts in Bernstein and Capus drama. He was at one time stage director at the Comédie Française. He acted in several plays produced in London and

in February, 1910, was selected for the part of Chantecler in Rostand's play of that name, taking the place of Coquelin, a part little to his liking. He was possibly best known for his interpretations of *Samson*, *Le Voleur*, *L'Emigré*, *Servir*, and *La Griffe*. Among his most recent performances were *Le Misanthrope* and *Tartuffe* brought out in 1922 and 1923. He was the author of the play *Grand Père* in which he had the title rôle, at the Porte St. Martin in 1917, and in the following year he appeared in another play of his own, *L'Archevêque et ses fils*. Guitry also appeared at the Vaudeville Theatre in Paris in 1919 as Pasteur in the play of that name written by his son Sacha Guitry, a well known dramatist, and also in the plays *Le Mari*, *la Femme et L'Amant* and *Mon Père avait Raison*. In January, 1921, he had the leading rôle in *Le Comédien*, in April of the same year in *Le Grand Duc*, and in November in *Jacqueline*, plays by his son Sacha. Guitry was known as an actor of great naturalness and versatility. Brought up in the classical training he gained a realization of character. Often he was able to make a poor play convincing by his human sympathy, passion, and humor. He was endowed with a wonderful memory and was a master of stage production.

GYE AND BARNARD, CANCER RESEARCH WORK. See CANCER.

GYMNASTICS. The national Amateur Athletic Union gymnastic championships of 1925 were held at Brooklyn, N. Y., the individual winners in the several events being: Horizontal bar, C. Rottman, New York T. V.; parallel bars, W. Meyer, unattached; side horse, C. Cremer, New York A. C.; flying rings, P. Krempel, Los Angeles, A. C.; rope climb, M. Kraemer, University of Pennsylvania; Indian club swinging, R. Dutcher, New York A. C.; tumbling, D. Sharpe, Los Angeles A. C.; all-around, A. Jochim, Swiss T. V.

The United States Naval Academy for the sixth year in succession won the intercollegiate championship with a total of 47 points. Dartmouth was second with 12 and the University of Pennsylvania third with 6. The individual winners were: Horizontal bar, Newhardt, Navy; parallel bars, Forest, Navy; side horse, Clark, Navy; tumbling, tie between Tullman and Zitzenwitz, both of Navy; flying rings, Stroop, Navy; rope climb, tie between Wheeler and Durham, both of Navy.

GYPSUM. In 1925 it was estimated that there was an increase of from 5 to 10 per cent in the quantity of gypsum mined in the United States, and a similar increase in the gypsum imported into the United States from Nova Scotia, New Brunswick, and Mexico. The last named country commenced the export of gypsum from deposits of San Marcos Island, in the Gulf of Lower California, the material being sent to plaster mills at Seattle and Long Beach, Cal. It was estimated also that the gypsum used in the manufacture of Portland cement would exceed 1,000,000 tons in 1925, of which 95 per cent was crude gypsum, which was ground with a clinker, while the remainder was calcined gypsum. Important new mills went into operation during 1925 and were situated west of the Rocky Mountains, with the exception of the large mill of the U. S. Gypsum Company, which was in New York State. The U. S. Geological Survey reported the gypsum produced in the

year 1924 as 5,042,629 short tons of crude, which with the calcined gypsum sold had a total value of \$42,724,507. In 1924 there was imported unground 519,728 short tons, valued at \$724,864; 5217 short tons of ground or calcined gypsum, valued at \$70,793; manufactured plaster of Paris, valued at \$48,059; and 539 short tons of Keenes cement, valued at 12,042, or a total value of all gypsum imported of \$855,758. In 1924 exports were stated at 10,623 short tons, valued at \$358,425.

**HAGGARD, SIR HENRY RIDER.** British novelist, died in London May 14. He was born at Bradenham Hall, Norfolk, on June 22, 1856, and was educated at Ipswich by private tutors. His first employment was as Secretary to Sir Henry Bulwer, Governor of Natal. In 1877 he served on the staff of the special commissioner to the Transvaal, Sir Theophilus Shepstone. In 1878 he became Master of the High Court of the Transvaal, and adjutant of the Pretoria Horse. Returning to England he married in 1880 and again went to Africa where he essayed farming. On his return to England he took up the practice of law. In 1882 he published *Cetewayo and his White Neighbors*, followed by two novels *Dawn* and *The Witch's Head*. His first novel of great popularity was *King Solomon's Mines* (1885), an imaginative romance with a thrilling and skillfully developed plot. In the following year the novel *She* scored a popular success, later novels included *Jess* (1887); *Allan Quatermain* (1887); *Cleopatra* (1889); *Montezuma's Daughter* (1894); *The People of the Mist* (1894); *Swallow, a Story of the Great Trek* (1899); *Elissa, A Zulu Idol* (1900); *The Brethren* (1904); *Ayesha, or the Return of She* (1905); *Queen Sheba's Ring* (1908); *Red Eve* (1911); *Child of Storm* (1913); *She and Allan* (1921); and *Heu-Heu: or The Monster* (1924). In 1891 in co-operation with Andrew Lang he published *The World's Desire*. A Conservative in politics he studied rural conditions in England and the Salvation Army Colonies there and in the United States. He published *Rural England* (1902); *A Gardener's Year Book* (1905); *The Poor and the Land* (1905); and *Report to British Government on Salvation Army Colonies, U. S. A.* (1905). Between 1912 and 1917 he made a tour of the world as a member of the Dominions Royal Commission and in 1918 he visited all the Overseas Dominions as the honorary representative of the Royal Colonial Institute to prepare a report in regard to the scheme for the after-war settlement of ex-Service men. He was knighted in 1912 and was made a K.B.E. in 1919. He was a magistrate for Norfolk and Suffolk and chairman of the Petty Sessional Division of Bungay.

**HAÏTI, hā'tē.** A West Indian republic comprising the western part of the island of Haiti or Santo Domingo, the other part comprising the Dominican Republic (q.v.). Capital, Port-au-Prince.

**AREA AND POPULATION.** The area has been variously estimated at from 10,204 to 11,072 square miles; population, estimated Jan. 1, 1924, 2,028,000, excluding 3000 foreign white residents and the military forces of the United States. The majority of the inhabitants are negroes, but there is a large number of mulattoes, who are descended from the former French

settlers. The language spoken is a dialect of French known as Creole French. The capital, Port-au-Prince, has a population of approximately 125,000; Cape Haïtien, about 20,000; Cayes, 15,000; Gonaïves, 7500; Port-des-Paix, 7500.

**EDUCATION.** Public elementary education is free, and has been compulsory since 1910. In the school year 1924-25 the number of schools in session was 944, and the number of enrolled students, 74,496. The rural schools have been much improved, and at the recommendation of the Chamber of Commerce of Haiti a school of commerce has been established. Secondary education is provided by national lycées and by private schools. The University of Haiti was established in 1921.

**PRODUCTION.** The chief occupation is agriculture and the principal product coffee. Cacao, tobacco, and cotton are also extensively cultivated, the last being exported in considerable quantities. Other products include sugar, rum and other spirits, logwood and other valuable timber. Mineral resources are comparatively undeveloped, though considerable. They include copper, coal, and iron, for the working of which some concessions have been granted; also gold, silver, antimony, tin, sulphur, kaolin, limestone, porphyry, nickel, and gypsum. The manufactures are practically negligible.

**COMMERCE.** The Financial Advisor-General Receiver of Haiti, writing in the *Pan American Union* for November, 1925, states that the trade of Haiti, in general, has experienced a gratifying improvement, during the three years 1921-24, an improvement which is particularly noticeable in exports and imports. The figures for the foreign commerce in the last four fiscal years are as follows:

Fiscal year	Imports Gourdes	Exports Gourdes	Total Gourdes
1921-22.....	61,751,355	53,561,050	115,312,405
1922-23.....	70,789,615	72,955,060	143,744,675
1923-24.....	73,480,640	70,881,610	144,362,250

In the fiscal year ended Sept. 30, 1925, the total value of Haiti's foreign commerce was \$39,641,327, as compared with \$28,872,450 for the previous year, an increase of 37 per cent. The gain was evenly distributed between exports and imports, the former increasing from \$14,176,322 to \$19,403,762, and the latter from \$14,696,128 to \$20,237,565.

The balance of trade was unfavorable, the imports exceeding the exports by \$833,803. The unfavorable balance in the previous year was \$519,805. High prices were received for the principal crop, coffee, and were largely responsible for the increased value of exports. Although exports of this commodity increased only about 5 per cent in quantity, the value increased over 50 per cent. Exports of lignum-vitæ, logwood and logwood extract, and honey increased, but declines occurred in cacao, cotton, cottonseed, and sugar. The relative share of the United States in the import trade of Haiti declined from 80.41 per cent in 1923-24 to 76.93 per cent during the fiscal year, although registering a large increase in value. In 1924-25 Haiti imported from the United States goods to the value of \$15,567,869 as against \$11,817,376 in the previous fiscal year. Great Britain increased its percentage from 6.70 to 8.52, Ger-

many from 3.05 to 3.97, and France from 6.02 to 6.72.

In the distribution of Haiti's export trade, France, as the largest purchaser of Haitian coffee, was, as in former years, the best customer. However, its percentage declined from 66.10 in 1923-24 to 63.45 in the past year. The participation of Great Britain and Germany also dropped, the former from 5.10 to 2.86, and the latter from 4.60 to 2.74 per cent. The United States increased its percentage from 9.38 to 11.95 per cent.

**FINANCE.** The accompanying table from the same source mentioned above shows the receipts of the republic for the fiscal years 1921-24.

<i>Fiscal year</i>	<i>Douanes Gourdes</i>	<i>Internal revenue Gourdes</i>	<i>Miscellaneous Gourdes</i>	<i>Total Gourdes</i>
1921-22.....	23,866,569.70	1,580,246.77	17,979.25	24,964,795.72
1922-23.....	28,192,586.35	2,699,448.24	58,071.65	31,950,101.24
1923-24.....	29,950,907.14	2,795,870.53	155,543.66	32,902,321.33

The Government revenues during the past year 1924-25 were the highest by far for any year since the establishment of the receivership. Total collections from all sources amounted to \$8,097,533 as against \$6,580,454 for the previous year, an increase of about 23 per cent. The receipts were nearly \$1,300,000 greater than for the previous high year, 1919, when they totaled \$6,799,490. Customs receipts accounted for \$7,015,003, or about 88 per cent of the total. Internal revenues contributed 10 per cent, the rest coming from miscellaneous sources. Of customs receipts, those from imports were 65.6 and those from exports 29.7 per cent of the total.

The expenditures in Haiti never exceed the receipts and the larger part of them are spent on public works, public health, and agriculture. The accompanying table gives the status of the public debt on Apr. 30, 1922, and Apr. 30, 1925:

	<i>Apr. 30, 1922 Gourdes</i>	<i>Apr. 30, 1925 Gourdes Series A Series B Series C</i>
Foreign debt .....	41,312,412.50	75,198,457.25
Internal debt .....	44,311,931.70	21,893,264.65
National railroad (including arrears of interest) .....	26,228,264.45	12,661,145.70
Fiduciary currency .....	6,070,824.00	6,080,309.50
Total .....	117,918,432.65	115,833,177.10

Expressed in U. S. currency the gross public debt was reduced from \$24,209,700 at the beginning of the fiscal year 1924-25 to \$23,046,252 at its close, a reduction of \$1,163,448, with the available balance in the general fund sufficient to reduce this to \$21,772,684.

**COMMUNICATIONS.** In 1923 there entered and cleared at the port of Port-au-Prince 410 steam vessels and 27 sailing ships. The railways total about 50 miles; the traffic is very light.

**GOVERNMENT.** Executive power is vested in a president elected for four years who acts through a ministry of five; legislative power in a national assembly, comprising a senate of 16 members elected for six years and a chamber of deputies of 40 members elected for two years by popular vote. President at the beginning of 1925, Louis Borno.

**HISTORY.** On February 10 Mr. Hannibal Price was received by President Coolidge as the Minis-

ter to the United States from Haiti. He stated that Haiti "relies on the more and more generous coöperation of its powerful partner in order to promote its development and prosperity." President Coolidge answered by saying "the sole purpose which inspires the Government of the United States in its compliance with the provisions of the treaty of 1915 is the promotion of the internal stability of Haiti and the welfare and prosperity of her people."

On March 6 Brig-Gen. John H. Russell, High Commissioner from the United States to Haiti, said in part: "The state of peace which the country has enjoyed in the last three years has continued undisturbed throughout the year with

the result that the Haitian feeling of security has been fortified. This is most favorable for the development of agriculture. The sound financial condition of the Haitian state together with the decided improvement in the economic condition of the country assure rapid progress toward stabilized government and the happiness and prosperity of the Haitian people. A situation in Haitian affairs as excellent as that set forth in this report could have been arrived at only with the entire coöperation of the Haitian government, working under the enlightened and distinguished leadership of President Borno.

In September the United States government published the following excerpt which appeared in the annual report of the Financial Adviser-General Receiver of Haiti: "For some years there has been a large annual movement of Haitians going to Cuba and other countries where remunerative work has been obtained. At the end of the active season it is customary for many of the emigrants to return to Haiti, and it has been estimated that such emigrants usually return with about 1000 gourdes each, whereas they left Haiti in virtual destitution. In the last two or three years it is estimated that 15,000,000 gourdes annually have been introduced by returning emigrants, and for the eight-year period it may be confidently stated 70,000,000 gourdes have found their way into Haiti in this fashion."

**HALLER, ALBIN.** French chemist and educator, died April 30. He was born at Tellernigen in the Province of Haut-Rhin, and was educated at the University of Nancy. After taking his doctor's degree and being trained as a pharmacist and chemist he became professor in the School of Pharmacy at Nancy in 1873, and professor of chemistry, and in charge of various chemical work in the Faculty of Sciences of Nancy University, 1879-99. Removing to Paris he became a director of the School of Higher Studies in the Sorbonne, director in the Municipal School of Physics and Chemistry, vice-president of the Academy of Sciences, member of the Academy of Agriculture, and correspondent of the Academy of Medicine. He was a member of the consulting committee of arts and manufactures for the Council of Hygiene. He received many honors, being twice *lauréat* of the Institute, 1887 and 1897 and being appointed a grand officer of the Legion of Honor. He also held

Italian and Roumanian honorary orders and a war medal of 1870. He published many memoirs and notes in the *Comptes rendus de l'Académie des Sciences*, and various scientific and technical journals. He prepared a report on the chemical industry at the Chicago Exposition in 1893. In collaboration with M. P.-Th. Muller he wrote *Traité de chimie élémentaire* (2 volumes), and other technical works.

**HAMILTON COLLEGE.** A non-sectarian institution of higher education at Clinton, N. Y.; founded in 1812. A total enrollment of 419 students registered for the 1925 fall session distributed as follows: seniors, 56; juniors, 83; sophomores, 114; freshmen, 166. There were 34 members on the faculty for the year 1925-26. During the year 1924-25 the erection of a new three-story Biology-Geology building was completed at an approximate cost of \$300,000. A new soccer field was laid out, and during the summer of 1925 the golf course was enlarged from six to nine holes. The productive funds of the institution were approximately \$3,384,300, and the income for the year 1924-25 was \$279,228. The library contained 109,110 volumes and 26,000 pamphlets. President, Frederick C. Ferry, Ph.D., Sc.D., LL.D.

**HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.** An institution for the education of negroes and American Indians, at Hampton, Va.; founded in 1868. The enrollment for the fall of 1925 was 959 (boarding students). The enrollment for the summer session of 1925 (two sessions) was 1074. The faculty numbered 119. The productive funds of the institute amounted to \$5,303,169.18 and the income for the year \$265,787.76. The volumes in the library numbered 59,664. Principal, Rev. James Edgar Gregg, D.D.

**HARBORS.** See **POETS AND HARBORS.**

**HARVARD UNIVERSITY.** A non-sectarian institution of the higher learning at Cambridge, Mass.; founded in 1636. The number of students enrolled for the year 1925-26 was 7652. They were distributed as follows: college, 3238; divided into seniors, 531; juniors, 727; sophomores, 815; freshmen, 1063; out of class students, 102; graduate school of arts and sciences, 767; special students, 52; engineering school, 289; theological school, 87; law school, 1320; medical school, 507; dental school, 188; school of public health, 33; graduate school of business administration, 688; school of architecture, 65; school of landscape architecture, 45; graduate school of education 352; Bussey Institution, 21. The officers of instruction numbered 1171, of whom 197 were professors; 39 associate professors; and 98 assistant professors. The total productive funds of the University, June, 1925, were \$69,069,909.92. The total income for the year, including gifts for immediate expenditure, was \$8,458,183.27. The total of volumes and pamphlets in the library was 2,416,500, which included 101,890 additions for the year.

The system of instruction requiring for graduation a general examination in the subject chiefly pursued in college, and providing tutors to direct the students in pursuing it, was applied in 1925 by the Division of Modern Languages, the largest in the number of its students and hitherto the only one with a general examination without tutors. The department of mathematics in turn determined to adopt the tutor system. The fees of new students in the college and the

Graduate school were raised to \$300, the scholarships being also increased. In the engineering school, fees were increased to the same amount; in the law school, to \$250; in the school of business administration, to \$500.

Lehman Hall, with the rooms for the Comptroller, Bursar, Superintendent of Grounds and Buildings, and other administrative officers, a building in the colonial style, was completed. Next to it, another dormitory, the gift of Jesse Isidor, Percy Selden, and Herbert Nathan Straus, in memory of their father, Isidor Straus, was in part constructed and was to be ready for students by the opening of the next college year. McKinlock Hall, a freshman dormitory, given by Mr. and Mrs. George Alexander McKinlock in memory of their son, George Alexander McKinlock, Jr., of the Class of 1916, killed in action in France, was also under construction in 1925, as was the new Fogg Art Museum, facing Sever Hall. Progress was made with the extensive buildings of the School of Business Administration, the gift of George F. Baker. In connection therewith former business associates and admirers of John W. Weeks, late Secretary of War, raised \$200,000 to build the university a footbridge across the Charles river, so as to supply a convenient access to the business school. For the projected chemical laboratories plans were brought near completion, so that ground might be broken in the spring. Funds were raised and land obtained for a Medical School Dormitory.

Dean Briggs of the Faculty of Arts and Sciences, retiring, was succeeded by Prof. Clifford Herschell Moore. Dean Lowes of the Graduate School of Arts and Sciences resigned and was succeeded by Prof. George H. Chase. The University created the post of secretary of student employment and selected Walker W. Daly to fill it. Among appointments on the teaching staff were those of Harold DeWitt Cross as professor of dentistry for children; Alfred Worcester as Henry K. Oliver professor of hygiene; William John Crozier as associate professor of general physiology; Donald Hamilton McLaughlin as professor of mining engineering; Thomas Reed Powell, Francis Hermann Bohlen, and Edmund Morris Morgan as professors of law; John Strong Perry Tatlock as professor of English; Arthur Meier Schlesinger as professor of history; Wetmore Hodges as associate professor of business research. The following promotions to professorships were also made: Edward Peirson Richardson as associate professor of surgery; James Lawder Gamble as associate professor of pediatrics; James Bryant Conant as associate professor of chemistry; Abbott Payson Usher and John Henry Williams as associate professors of economics; André Morize as professor of French literature; Calvert Magruder as professor of law; Samuel Eliot Morison as professor of history; Carl Newell Jackson as professor of Greek and Latin; George Harold Edgell as professor of fine arts. Jean Jacques Haffner, professor of architecture, was appointed to the Nelson Robinson Jr. professorship of architecture. Prof. Charles Burton Gulick was made Eliot professor of Greek literature, and Prof. Charles Townsend Copeland Boylston professor of rhetoric and oratory. The following were appointed to new named professorships: Gregory Paul Baxter to the Theodore William Richards professorship of chemistry; Arthur Becket Lamb

to the Sheldon Emery professorship of organic chemistry; William Bennett Munes to the Jonathan Trumbull professorship of American history and government; Arthur Kingsley Porter to the Boardman professorship of fine arts; and Kenneth Daniel Blackfan to the Rotch professorship of pediatrics. Prof. Edmond Estève of the University of Nancy lectured as exchange professor at Harvard, and Prof. William M. Wheeler was sent as exchange professor to France. Exchange professorships were maintained with a previously established group of Western colleges.

Apart from the special ten-million-dollar campaign total recently sought, and from the income paid as capital under the will of Gordon McKay, the payment of previous subscriptions to the Alumni Endowment Fund, and sums received for pensions from the Carnegie Foundation, the gifts and legacies received during the year came to \$5,170,312.37. President, Abbott Lawrence Lowell, Ph.D., LL.D.

**HAVERFORD COLLEGE.** An institution of the higher education under the control of the Society of Friends, at Haverford, Pa.; founded in 1833. Registration for the fall term of 1925 totaled 255 students, distributed as follows: graduates, 6; exchange students, 1; seniors, 51; juniors, 42; sophomores, 66; freshmen, 89. There were 25 members of the faculty. The productive funds taken at par value amounted to \$3,747,212.01 and the income for 1925 was \$384,049.91. The library contained 98,000 volumes. President, William Wistar Comfort, Ph.D., Litt.D., LL.D.

**HAWAII.** A territory of the United States, consisting of a group of islands in the north central Pacific Ocean; formally annexed, Aug. 12, 1898. The nine inhabited islands, with their respective areas in square miles are as follows: Hawaii, 4015; Maui, 728; Oahu, 598; Kauai, 547; Molokai, 261; Lanai, 139; Niihau, 97; Kahoolawe, 69; Midway Island, 2.7. Capital, Honolulu, on the island of Oahu. The population at the census of 1920 was 255,912. The population of the territory was estimated to be 323,645 on June 30, 1925, an increase of 67,733 in the five and a half years since the Federal census. The total number of steerage arrivals during the year ending June 30, 1925, was 13,954, as against 12,609 for the prior year, divided as follows: Chinese, 519; Japanese, 1182; Filipinos, 11,696; Koreans, 7; Porto Ricans, 35; Portuguese, 115; Spanish, 13; Russian, 4; all others, 383. The departures aggregated 8408 as against 10,231 for the previous year. The total number of deaths in the territory was 4017, as compared with 4218 for 1924. The number of deaths of infants under one year of age showed a decrease for the year, there being 1358 deaths and the death rate to each 1000 live births was 103.59. The races showing the highest and lowest mortality were, respectively, the Filipino, 287.38 and Caucasian, 36.96. There were 13,109 births, an increase of 981 over the prior year. The birth rate was 41.57 per 1000 population and the increase of births over deaths, 266.

**EDUCATION.** Education is compulsory from the ages of 6 to 14, the maximum having been lowered in 1923. During the year there were maintained 175 public schools, with 1719 teachers and 55,044 pupils, as against 1566 teachers and 51,557 pupils the previous year. There were 65 private schools, with 462 teachers and 9872

pupils, as against 471 teachers and 9557 pupils for the previous year, making a grand total for the year of 240 schools, 2181 teachers, and 64,916 pupils. The thirteenth session of the Territorial legislature, which convened February to April, 1925, enacted laws in connection with the programme of development in the department of public instruction, the most important of which were: A new Territorial pension system, which includes all Territorial employees as well as teachers. The new pension scheme assures the teachers that if they give their life in public service they need have no fear about old age, for under this scheme all employees who have served 35 years will draw annually approximately half of their last annual salary during the remainder of their lives; a law requiring the payment of foreign-language fees from litigating as well as nonlitigating schools and prohibiting injunction against the Territory carrying out that particular law; a law allowing teachers born in the Territory, but who have lost their citizenship through marriage to aliens, to be again reappointed as teachers in the elementary schools of the Territory; a law providing for accepting Federal aid for the promotion of vocational education in the Territory of Hawaii, through the Smith-Hughes act of Congress. Some of these laws were passed in the attempt to remedy the evils of the turnover in the teaching profession, which was a very serious problem in the Territory. Many teachers who are trained and prepared for teaching leave the profession at a time when they have had only enough experience to make their work really valuable.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, Hawaii's progress during the fiscal year 1924-25 was marked by unusual activity, notwithstanding certain adverse factors. The agricultural situation was saved by bumper crops, which offset to a certain extent the slump in prices for the island's two principal crops, sugar and pineapples. New irrigation schemes were commenced, inter-island shipping augmented, docking and warehouse facilities greatly increased, and the building programme had gathered considerable momentum. A noteworthy move during the year was the employment of an expert to make an industrial survey of Hawaii. It soon developed the fact that there were a great many openings in the islands for industries of various kinds, which, when properly developed, should offer employment for a considerable number of persons as well as tend to lessen the islands' economic dependence upon sugar and pineapples. Until recently almost 90 per cent of the population was employed in the culture and preparation of these two products for the market, and development in other directions was neglected. As a result, a crop failure or a slump in the price of sugar or pineapples affects adversely the entire community.

Although unusually large crops were realized during the year ending June 30, 1925, the value of exports declined considerably from the preceding year, as a result of lower prices for the principal commodities, especially sugar. The value of exports to foreign countries and continental United States dropped from \$106,212,651 during 1923-24 to \$99,042,432 for the year ended June 30, 1925. The share coming to continental United States, fell from \$104,549,651 to \$97,627,432. This decline was accounted for almost en-

tirely by a \$10,000,000 drop in the value of sugar, notwithstanding a considerable greater volume of shipments, and would have been greater had it not been offset somewhat by a \$2,000,000 increase in the value of canned pineapple exports. The value and volume of shipments of these two commodities to continental United States during the year ended June 30, 1925, as compared with the preceding year, are shown in the following table:

EXPORTS OF HAWAIIAN SUGAR AND PINEAPPLES TO CONTINENTAL UNITED STATES

Items	Quantity		Value	
	1923-24 Pounds	1924-25 Pounds	1923-24	1924-25
Sugar, refined .....	6,600,450	14,900,020	\$585,140	\$981,152
Sugar, unrefined .....	1,164,787,582	1,857,442,499	78,935,808	63,632,662
Pineapples, canned .....	297,965,685	840,352,644	28,247,410	30,218,988

The preceding table shows that refined sugar exports were more than double those of the preceding year. With the further development of water power and its utilization in industry, it is probable that Hawaii in time will export the greater part of its sugar crop in the refined state instead of in the raw state. The manufacture of molasses, a by-product of the sugar industry, appears also to be growing fast. Exports of this product to continental United States during the year reached 19,827,189 gallons, almost double the volume for the preceding year. Among other items on the export list indicating increases in value might be mentioned coffee, green and ripe bananas, honey, tallow, and raw wool. Until late years the coffee crop had been declining, owing to the uncertainty of the crop and to keen competition from Brazil, where the cost of production was somewhat lower. With higher prices prevailing, however, interest in coffee culture is being renewed and planters are planning to market in the United States under a trade name so that a permanent demand may be created. Fish, dried and canned, was the only major item on the list, except raw sugar, showing a decline in value.

Notwithstanding a decline in the value of exports, imports from continental United States advanced from \$71,011,469 in 1923-24 to \$73,021,929 in 1924-25. Imports from foreign countries advanced from \$9,292,000 to \$10,299,000 over the same period, due in part to increased purchases of rice from the Orient. Practically all major items on the list of imports from continental United States, particularly fish, tobacco, fibre bags, wool and silk textiles, vehicles, chemicals, and musical instruments, registered increases. Slight declines occurred in the value of cotton cloth, wood and paper, iron and steel, and copper imports. A notable decrease was evident in receipts of sugar, as a result of the developments of the Hawaiian refining industry.

**FINANCE.** The income of the various counties aggregated \$8,814,282 as against \$7,944,447 for the prior year. The assessment of property, real and personal, aggregated \$360,832,895, as against \$357,002,080 for the year previous. The total revenue collected by the Territory aggregated \$15,847,969.93; the total disbursements, \$15,610,482.15. The net cash balance on June 30, 1925, was \$1,070,608.13, and the net cash balance on June 30, 1924, was \$833,120.35. The total bonded debt on June 30, 1924, was \$18,585,000, which was reduced to \$17,990,000 on June 30, 1925. Bank deposits at the end of

the year amounted to \$60,809,715.97. The Territory paid into the Federal treasury taxes amounting to \$7,548,170.34, of which \$5,693,766.47 was paid through the Internal Revenue Bureau and \$1,854,403.87 collected on imports received in the Hawaii customs district.

**COMMUNICATIONS.** All the nine islands have steam railroads operating on regular schedules, most of them carrying passengers. In 1924 the mileage of track was 344.11. Regular steam-

ship communication with the mainland is maintained by the Matson Steamship Company, operating between San Francisco and Hawaii; by the Alaska Steamship Company, connecting with Seattle; by the Isthmian Steamship Lines, with headquarters in New York; by the Los Angeles Steamship Company, operating between Los Angeles and Hawaii; and other companies.

**DEFENSE.** The Hawaiian Islands, guarding the western coasts of the United States, are its western outpost. There is no limit to the thoroughness with which the United States may wish to make use of these defenses, since during the period of the Washington Conference Agreement the further western possessions of Guam and the Philippines cannot be further fortified. The Hawaiian Islands must be defended so they cannot pass into the hands of an attacking force landing from a hostile fleet able to reach them. The object of the war games of 1925 was to test the strength of the Islands. It was shown that the larger American battleships were unable to enter Pearl Harbor because there was not sufficient depth of water in the channel. The result of the fleet operations against Oahu showed conclusively that the land defenses of Hawaii were inadequate. The maneuvers in 1925 showed that the Army, Navy, and Air forces regularly stationed in Hawaii could not defend themselves against the attack by a fleet about the size of the third largest.

**GOVERNMENT.** The territorial elections are held regularly in November of each even year, to elect the delegate to Congress from Hawaii for two years, one-half of the Hawaiian Senate for four years, and all the members of the House of Representatives, for two years. The sessions of the legislature are held biennially in odd-numbered years. Governor, at the beginning of the year, Wallace R. Farrington.

**HAY.** Data relating to hay production in different countries in 1925 were not available. The United States, according to estimates published by the Department of Agriculture Dec. 22, 1925, produced 99,515,000 tons on 74,131,000 acres, as compared with 112,796,000 tons on 76,514,000 acres in 1924, the average yields per acre being 1.34 tons and 1.47 tons respectively. The crop of 1925 was made up of 86,474,000 tons of tame hay and 13,041,000 tons of wild hay, including marsh, salt and prairie hay. Both classes showed a reduction in total yield, average yield per acre and acreage as compared with the preceding year. A further analysis, made by the Department of Agriculture, of the tame hay

crop of 1925 indicated a production of 28,858,000 tons of alfalfa hay (See ALFALFA), 21,349,000 tons of mixed clover and timothy hay, 11,231,000 tons of clover hay, 9,712,000 tons of timothy hay, 7,816,000 tons of hay from Sudan, Bermuda, Johnson and orchard grasses, red top, and mixed cowpeas and sorghum, 4,587,000 tons of hay made from grains cut green, and 2,941,000 tons of hay made from soy beans, cowpeas, velvet beans, peanuts and other annual legumes. The yields of tame hay in 1925 for the leading States were as follows: New York 6,730,000 tons, Wisconsin 5,481,000 tons, California 5,414,000 tons, Pennsylvania 4,274,000 tons, Iowa 4,236,000 tons, and Minnesota 4,132,000 tons.

The average farm price of all hay on Dec. 1, 1925, was \$13.26 per ton, or 28 cents higher than the year before. The average farm price of tame hay in the different States on that date ranged from \$7.20 per ton in North Dakota to \$24.50 per ton in Connecticut, and similarly the average farm price of wild hay from \$5.80 per ton in North Dakota to \$17 per ton in Alabama and Tennessee. The stocks of hay on farms May 1, 1925, were reported at 15,679,000 tons, or 13.9 per cent of the preceding year's production. The hay crop and the seed production of hay crops in 1925 suffered in different sections through drought. The seed crops of timothy, blue grass, red top and alsike clover were reduced below the yields of 1924 but red clover, sweet clover, and alfalfa seed yields were about up to the preceding year's production.

Canada, in 1925, produced as estimated 12,000,000 lbs. of alsike clover seed, or about 20 per cent more than in 1924. The United States, in the fiscal year ended June 30, 1925, imported over 10,000,000 pounds of alsike clover seed, nearly all of which came from Canada. During the same period importations of other forage plant seeds were as follows: red clover 6,540,000 pounds, white clover 1,225,000 pounds, crimson clover 4,340,000 pounds, and hairy vetch 2,065,000 pounds. Nearly 5,000,000 pounds of the red clover seed and most of the crimson clover seed came from France, and about half of the white clover and hairy vetch seed from Germany.

**HAYFORD, JOHN FILLMORE.** American scientist and director of the College of Engineering, Northwestern University, died in Evanston, Ill., March 10. He was born at Rouse's Point, N. Y., May 19, 1868, and graduating from Cornell University in 1889 with the degree of C.E. was immediately appointed computer for the U. S. Coast and Geodetic Survey. He served as assistant astronomer to the international commission to determine the boundary between the United States and Mexico in 1892-93, and in the following year became connected with the United States Coast and Geodetic Survey as aid and later assistant. From 1895 to 1898 he was instructor in civil engineering at Cornell University and in the latter year became expert computer and geodesist of the United States Coast and Geodetic Survey where he inaugurated investigations of the figure of the earth and its structure in relation to the law of gravitation. As inspector of geodetic work and chief of the computing division he served with the U. S. Coast and Geodetic Survey 1900-09, developing the theory of isostasy. In September, 1909, he was appointed director of the College of Engineering of Northwestern University, continuing until his death. From 1915 to 1923 he

was a member of the National Advisory Committee for Aeronautics and for many years a research associate of the Carnegie Institute of Washington. He was connected with many important boundary surveys in various parts of the western hemisphere. His measurement of the equatorial and polar diameters of the earth was accepted by the International Geodetic and Physical Union at its meeting held in Madrid, Spain, in 1925. It was stated that as a result of this action every boundary survey of the earth would be based on the Hayford figures. Professor Hayford was the author of *Geodetic Astronomy* (1898); and many monographs and reports of the coast survey and elsewhere dealing with geodesy and kindred subjects.

**HAYNES, ELWOOD.** Inventor and builder of the first mechanically propelled automobile in America, died in Kokomo, Indiana, April 13. He was born in Portland, Indiana, Oct. 14, 1857, was graduated at the Worcester Polytechnic Institute, 1881, and studied later at the Johns Hopkins University in Baltimore. He taught sciences 1885 to 1886 in the Eastern Indiana Normal School at Portland and in 1886 became manager of the Portland National Gas & Oil Company, remaining until 1901. In 1887 Mr. Haynes started to develop a carriage mechanically propelled by a self-contained gasoline engine. He worked on this idea until 1892 when he moved to Kokomo. In the following year he built a car with a one h.p. marine upright two cycle gasoline engine weighing 180 lbs., which was the first successful self-propelled gasoline vehicle to be made in the United States. This car was presented by him to the Smithsonian Institution in Washington where it is on exhibition with the label, "Gasoline automobile built by Elwood Haynes in Kokomo, Indiana, successful trips made at a speed of 6 or 7 miles an hour, July 4th, 1894." Mr. Haynes discovered as early as 1881 tungsten chrome steel. In 1897 an alloy of chromium and nickel, in 1900 an alloy of cobalt and chromium which later he developed for cutting instruments. He was the first to use aluminum in an automobile engine and in 1903 he invented and built a rotary valve gas engine. He also discovered in 1911, "stainless steel" which was patented in 1919, and was president of the Haynes Stellite Company which was engaged in the manufacture of tool metals and other alloys. An active Presbyterian, he was trustee of Western College at Oxford, Ohio, and of Winona Assembly and Bible Conference at Winona Lake. He also was a member of the organizing committee of the Eighth International Congress of Applied Chemistry, New York and Washington, September, 1912.

**HEART DISEASE.** The new drug quinine, introduced into the treatment of heart disease in 1921 as second in importance only to digitalis, had not come into any general use, according to Paul D. White (*Boston Medical and Surgical Journal*, August 13). This was due partly to inertia and partly to certain accidents following its use which in all likelihood were not attributable to the action of the drug. It had become apparent that the new drug was of value in certain indications to the exclusion of others, and in which digitalis is not of value or of less value. The chief indication is in paroxysmal fibrillation in which its use is free from any danger. Patients with this affection are greatly pleased with its action. Anywhere

from 2 to 12 grains may be required, to be taken in the forenoon—for the attacks are most apt to come on late in the day. The action here is therefore preventive rather than alleviating. The second indication is in one type of permanent fibrillation which makes up a fourth to a third of all cases. After a test dose has been given—2 or 3 grains—to determine the sensitiveness the patient should take a daily amount of about 30 grains for the space of a week. If the rhythm has not become normal by that time the drug should not be continued.

**HEAVISIDE, OLIVER, F.R.S.** British electrical engineer and physicist, died at Torquay, February 4. He was born in London, May 13, 1850, and for a few years was employed at Newcastle-on-Tyne by the Great Northern Telegraph Company, but after 1874 he retired to Devonshire where he devoted himself to electrical research and studying particularly Clerk-Maxwell's theory and attempted to reduce to practice various theoretical considerations. In the course of his work he reached the conclusion that the transmission of waves over a conductor would be facilitated by the proper insertion of self-induction along the line. The development of this important principle was effected by Prof. M. I. Pupin working independently in the United States. Heaviside's research had a relation to wireless telegraphy. He maintained that the electric waves would accommodate themselves to the surface of the sea much as they followed metallic wire, and that in the higher regions of the air there was a permanently ionized layer which, being as good a conductor as sea water, would act as an upper guide. Heaviside was elected a member of the Royal Society in 1891, and published two volumes of *Electrical Papers* (1892), and later two volumes entitled *Electromagnetic Theory*.

**HEDGES, JOB ELMER.** American lawyer, died February 22. Born at Elizabeth, N. J., May 10, 1862, he graduated from Princeton in 1884 and from the Columbia Law School in 1886. He was admitted to the bar in 1886 and up to his death practiced in New York City, though at times holding public office. He was elected secretary to Mayor William L. Strong for the term 1895-97, and in 1897 became a City Magistrate. In 1902 he was Deputy Attorney General for the State of New York, but resigned. He also was a commissioner for the United States of the International Fisheries Commission and was receiver for the New York Local Traction Companies when they became financially involved. He was active in Republican politics, a gifted public speaker and a man highly esteemed in Republican political life as well as in the legal profession.

**HELIUM.** See CHEMISTRY, INDUSTRIAL; also AERONAUTICS.

**HEREDITY.** See ZOOLOGY.

**HESSE, hēs.** A former grand duchy of the German Empire; since November, 1918, a republican state, forming a part of the new German Republic, situated in the western part of Germany. Area, 2968 square miles; population, according to the census of 1919, 1,291,249. Capital, Darmstadt, with a population of 82,368. The largest town is Mayence or Mainz, of 107,930 inhabitants (with suburbs). Other large towns: Offenbach, 75,380; Worms, 44,290; Gießen, 33,409. In 1923 elementary schools maintained by the communes but aided by the state

numbered 967, with 4429 teachers and 168,656 pupils. The chief products are rye, potatoes, barley and wine. No later figures for acreage and yield are available than those cited in the preceding YEAR BOOK. The ordinary revenue and expenditure for the year 1923 balanced at 23,517,347,296 paper marks. The government has a uni-cameral legislature and a responsible ministry. As a result of the elections of December, 1924, the Landtag was composed as follows: Majority Socialists, 25; Democrats, 6; German People's Party, 9; Centre (Catholics), 11; German Nationalists, 5; Hessian Peasants' Union, 1; Communists, 4; other parties, 8. There are 70 members elected for three years. The cabinet at the beginning of the year was headed by F. Ulrich, premier and minister of foreign affairs. Other members were: Herr Henrich, Finance; and Herr von Brentan, minister of the Interior and minister of Justice.

**HEXYLRESORCINOL.** See CHEMISTRY, INDUSTRIAL.

**HIDES.** See LEATHER.

**HIGH BLOOD PRESSURE.** During the year the daily press announced that the problem of high blood pressure had been conquered and sufferers from this condition importuned their medical advisers to procure the remedy for them. The profession was not convinced that such a remedy was desirable, reasoning that the increase of pressure is only a compensatory or defensive reactionary procedure. The substance in question was an extract of liver substance which for the previous ten years had been used in animal experiment to lower blood pressure, and the function of which had recently been rediscovered by Dr. MacDonald of the University of Toronto, who apparently was the first to test the extract on human subjects with high pressure. His report, which appeared in the *Canadian Medical Association Journal* for July, 1925, deals with 33 cases of essential hypertension with an average systolic pressure of 204 mm. which was brought down to an average of 142 mm. Eight of the 33 patients complained of a disagreeable general reaction. Dr. Major of Kansas City in the course of some original research on a great variety of depressor substances confirms the finds of MacDonald as to liver extract, but recommends that it should be used cautiously. The action is not only prompt but is maintained for a considerable period.

**HIGH SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**HIGHWAYS.** See ROADS AND PAVEMENTS.

**HILLEBRAND, WILLIAM FRANCIS.** American authority on mineral chemistry, died February 7. He was born at Honolulu on the Island of Oahu, Dec. 12, 1853, the son of a physician who was also an authority on the botany of the Hawaiian Islands. In youth he made visits to Java, China, and India. He attended Cornell for two years, but making up his mind in 1872 to become a chemist, he went to Heidelberg, and studied there under Bunsen and Kirchhoff. He prepared, in association with T. H. Norton the first specimens of metallic cerium, of metallic lanthanum, and of their alloy, didymium. His researches proved these metals to be trivalent and to belong in the rare earth group. He discovered the fire-kindling property of cerium filings, later utilized in burner tips. After gaining his doctorate in 1875, he studied at Strassburg, 1876-77, under Fittig,

and at the Mining Academy at Freiburg, 1877-78. Returning to the United States, he worked for a time as an assayer at Leadville, Colo. Joining the staff of the U. S. Geological Survey, he was stationed, 1880-85, at Denver, and afterward was at Washington, where he became chief chemist of the U. S. Bureau of Standards in 1908.

Hillebrand wrote about 100 papers, which are judged, in the aggregate, to have had a considerable influence on technical progress in mineral analysis. He introduced new standards of accuracy and completeness in this type of work. Exact analyses, on which he insisted, revealed the greater proportion of certain elements, notably strontium and barium, in the igneous formation of the Rocky Mountain region, a discovery received as a contribution to geological knowledge. In an investigation of uraninite, 1890, Hillebrand succeeded in isolating helium gas, but mistaking it for a nitrogen residue, failed to identify the then unique find. He suggested in 1904 the recovery of potash which escaped in one of the processes of Portland cement manufacture, where its recovery is now practiced commercially with profit. His methods of rock analysis were studied in many countries, and translated into German. He left almost finished at his death a work on inorganic analysis, to be carried to completion by G. E. F. Lundell. Hillebrand was a Fellow of the American Association for the Advancement of Science, a member of the American Chemical Society and for some years its head, and a member of the American Philosophical Society, the American Academy of Sciences, the American Society for Testing Materials and other learned bodies. He received from Columbia University the Chandler Medal in 1916. For many years he was associate editor of the *Journal of the American Chemical Society* and of the *Journal of Industrial and Engineering Chemistry*.

**HILPRECHT**, hil'prĕkt, HERMAN VOLLRAT. An Assyriologist and explorer, died March 20. He was born at Hohenerxleben, Germany, and was educated at Bernburg and Leipzig. After studying Old Testament theology and archaeology in 1886 he came to the United States, becoming editor of the Oriental department of the *Sunday School Times*. He served 1887-1911 as Clark research professor of Assyrian and professor of comparative Semitic philology at the University of Pennsylvania, studying the Assyrian inscriptions in the British Museum, and traveling in Syria, Babylonia, and Asia Minor. In 1888 he accompanied the University of Pennsylvania expedition to Nippur and between 1895 and 1914 was in charge of four expeditions at this place where excavations of great importance were made. He reorganized the Babylonian department of the Imperial Ottoman Museum in Constantinople, and was considered a leading authority on cuneiform paleography. He contributed to theological and Oriental journals, especially the *Theologisches Literaturblatt*. He was the editor-in-chief of *The Babylonian Expedition of the University of Pennsylvania* (4th series). He also wrote, *Freibrief Nebuchadnezzars I.* (1893); *Assyriaca* (1894); *Old Babylonian Inscriptions, Chiefly from Nippur* (1893); *Business Documents of Mursili Soma, of Nippur* (1898); *Ausgrabungen in Assyrien und Babylonien* (1904); and *The Oldest Version of the Baby-*

*lonian Deluge Story and the Temple Library of Nippur* (1910; also in Ger. ed.).

**HISTORICAL ASSOCIATION, AMERICAN.** A society for the promotion of historical studies and writing, formed in 1884 by a group of American scholars. It received its charter from Congress in 1889. Its membership extends throughout the United States, and its headquarters are at Washington. Its reports, published under provision made by the United States Government, appear yearly. The association is charged with the office of communicating its proceedings and its information on the state of historical study and writing to the secretary of the Smithsonian Institution, for transmission to Congress. It possesses important collections of printed and manuscript historical material, kept partly in the Smithsonian Institution and partly in the National Museum.

The Association had in 1925 some 2900 members, who among them represented not only every State of the Union, but also Canada and many European and South American countries. It invites to membership not only those engaged in historical work and teaching but all feeling a sufficient interest in historical science to prompt them to join. Its membership accordingly extends among many professions. Meetings of the Association are annual. That of the year 1925 was held December 28-31 at Ann Arbor, Michigan, and was marked by addresses and conferences of importance. A conference including State and local historical societies, designed to promote coöperation among them and to strengthen the contact with the national Association, forms an important feature of the annual meetings.

For the encouragement of historical research the Historical Association offers two biennial prizes of \$200 each, for the best monograph, printed or manuscript, in the English language, submitted by a writer who has not achieved an established reputation. The Herbert Baxter Adams prize is awarded in odd years for an essay in the history of the eastern hemisphere. In even years the Justin Winsor prize is awarded to an essay in the history of the western hemisphere, including the insular possessions of the United States. A third prize, bearing the name of its founder, the late George Louis Beer, amounting to \$250 is offered annually for the best work upon any phase of European international history since 1895; while a medal struck in honor of Jean Jules Jusserand, late Ambassador of the French Republic to the United States and a former president of the Association, is offered annually for the best work on intellectual relations between America and one or more European countries.

*The American Historical Review* (quarterly) is the official organ of the Association, which also publishes the *Annual Report*, containing proceedings, important papers read at the annual meetings, texts of significant documents, reports on American archives, reports on history teaching and papers on agricultural history. The Association appoints the Board of Editors of *The Historical Outlook*, a periodical devoted to the history teaching profession. Publications issued during 1925 were: *Annual Report 1920* (containing the proceedings for 1920); *Annual Report 1922, Supplement* (Writings on American History, 1922). A Pacific Coast Branch of the Association was organized in 1904. Officers in

1925 were: President, Charles M. Andrews; First Vice-President, Dana C. Munro; Second Vice-President, Henry Osborn Taylor; Secretary, John S. Bassett; Treasurer, Charles Moore; Assistant Secretary-Treasurer, Patty W. Washington; Editor, Allen R. Boyd. General offices of the Association are in the Woodward Building, Washington, D. C.

**HOCKEY.** The world's professional hockey championship for 1925 was won by the Victoria Cougars, who defeated the Montreal Canadiens, winners of the National Hockey League title, three games to one. The Pittsburgh Yellow Jackets for the second year in a row captured the United States amateur championship through their triumph over the Fort Pitt Hornets, holders of the Eastern division title. The Yellow Jackets won all three games played. The Allen Cup, emblematic of the amateur Canadian championship, went to the Port Arthur sextet. That interest in hockey was growing in the United States was evidenced by the admission of two new American teams into the National Hockey League. The newcomers were New York and Pittsburgh, the league now comprising besides these two teams the Canadiens and Maroons of Montreal, the St. Patricks of Toronto, the Ot-tawas, and Boston.

**HOG CHOLERA.** See VETERINARY MEDICINE.

**HOGS.** See LIVESTOCK.

**HOGS, FEEDING GARBAGE OF AMERICAN CITIES TO.** See GARBAGE AND REFUSE DISPOSAL.

**HOLDEN, JAMES.** Financial author and educator, died June 12. He was born at Pontiac, Mich., Nov. 10, 1846, and after receiving a public school education removed to Emporia, Kansas, where he became an investment banker. From 1902-14 he resided in Denver, Colo., and in the latter year removed to New York City. While at Emporia he edited and published *The Independent League*, 1890-96, in which he advocated a scientific certificate money system. He was the author of many pamphlets on the science of money, including *Metallic Money and Hard Times*; *The Disturbing Factor in Human Affairs*; *The Cause of Poverty Unveiled*; etc. He was one of the founders and editor of *Money*, a monthly magazine published in New York since January, 1921.

**HOLLAND.** See NETHERLANDS.

**HOLY CROSS, COLLEGE OF THE.** A Roman Catholic institution of the higher learning, under the Society of Jesus, at Worcester, Mass.; founded in 1843. The enrollment for the autumn of 1925 totaled 1089 with a distribution as follows: seniors, 201; juniors, 235; sophomores, 257; freshmen, 303; and in the B.S. course, 30 sophomores and 63 freshmen. There were 75 members on the faculty. The library contained 100,000 volumes. President, Rev. Joseph N. Dinand, S.J.

**HOLY YEAR.** See ROMAN CATHOLIC CHURCH.

**HOME RULE, MUNICIPAL.** See MUNICIPAL GOVERNMENT.

**HONDURAS,** hōn-dōs'rās. A Central American republic, bounded on the north and northeast by the Caribbean Sea, on the southeast by Nicaragua, on the southwest by Salvador and the Pacific Ocean, and on the west by Guatemala. Capital, Tegucigalpa.

**AREA AND POPULATION.** Estimated area, 44,275 square miles; population Jan. 1, 1923, according to official estimates, 673,408, mostly

Indians with a strain of Spanish blood. The movement of population in 1922 was: Births, 35.06 per thousand; deaths, 18.75 per thousand; marriages, 2.83 per thousand. The chief towns with their populations according to the latest available figures: Tegucigalpa, the capital, 40,000; La Esparanza, 11,453; Santa Rosa, 10,574; Choluteca, 8065; and San Pedro Sula, 7820. The chief ports are: Amapala on the Pacific, and Porto Cortez and Omoa on the Atlantic.
